In this definition, Barton brought out the different orientations each individual has to the discourse community to which he or she belongs. We can imagine a novice language teacher joining a teachers association and attending conferences and receiving its newsletter. After a while she might lose interest, stop attending conferences, and throw out the newsletter when it comes through her letterbox. Later, however, she might begin to undertake a further educational qualification. She might start attending conferences again, read the newsletter, and even contribute some articles based on her further study. She might then be invited to serve on a committee of the association and contribute to the making of policy and the organization of association events. In short, over time, the individual's status in the community shifts – it may be marginal or it may be central. A central member will have more say over the ethos of the community and will have more resources at his or her disposal for communication than a marginal member. If we suppose that this fictional teacher is typical of members of a discourse community, then we can begin to rethink discourse communities as large, fuzzy, porous, dynamic groupings, rather than as a static set of qualified individuals. Presumably, too, our imaginary teacher has other interests, domestic and public, that simultaneously involve her in different discourse communities to different degrees.

In addition, Barton pointed out that not all discourse communities have the participatory structure of, say, a teachers association. Magazines geared to teenagers will have a less participatory structure than newsletters produced by teachers' associations. Few of the readers will ever become writers for the magazine, and the readership will by its nature be transient and renewed, as people get older and move on. Even so, publications like this usually have a participatory mechanism, such as a letters page, where at least some of the readers can articulate their opinions or share their problems and thus constitute a visible community of which the reader is invited to feel part.

Bex (1996) adopted and adapted another concept from sociolinguistics in his redefinition of discourse communities: that of loosely knit and closely knit social networks (cf., Milroy, 1987). In her work on dialect preservation and change, Milroy observed that, when members of a speech community interact with each other regularly in their public and private lives (i.e., if they work and socialize together), then the community can be characterized as 'close-knit' and dialect is maintained. When people commute to work, interact with different people when they socialize, and have a number of links with 'outsiders,' then they are loosely tied to their speech community, and so dialect tends not to be preserved. Bex argued that this process has a parallel in discourse communities. The teacher who is an active member of an association, both reading and writing articles for the association newsletter and regularly attending conferences and leading workshops, will be closely tied to this discourse community and will have internalized more fully its generic codes and conventions than a loosely tied teacher who sometimes reads the newsletter. Readers of a magazine for teenagers would generally not move much beyond a loose affiliation with a fairly disparate community. The nature of the discourse community and the nature of the individual's involvement with it, then, are both variable. Bex (1996: 66–67) emphasized the dynamic nature of discourse communities:

> What I am proposing then is a complex interrelationship between social discourses, discourse communities, text production, and text reception. The model I have in mind is entirely dynamic. Individuals either produce, or produce interpretations of, texts according to the norms of the discourse community and the functions which the text is intended to serve within that discourse community. These are then verified by the group as meaningful, or challenged and refined. Such groups may develop highly characteristic modes of expression that remain internal to the group. However, these modes of expression are always situated historically, in that they develop from earlier 'ways of saying,' and socially, in that they interact with and take on (some) of the meanings of the larger social groups of which they are part.

Bex used this dynamic model of the discourse community to account for the generic conventions of a variety of texts, from academic texts to advertising to junk mail to literature. Such a dynamic model of the discourse community allows genre analysts to move away from the notion of genre as being confined to ritualistic sequences of speech or writing uttered to

perform predictable actions by a specific group of qualified people.

More recent work on genre in applied linguistics continues to address the concept of the discourse community in academia and highlights the danger of thinking of even close-knit discourse communities, such as those of academic disciplines, as being homogeneous, harmonious groupings of individuals. Hyland (2000: 11) observed the following:

> Communities are frequently pluralities of practices and beliefs which accommodate disagreement and allow subgroups and individuals to innovate within the margins of its practices in ways that do not weaken its ability to engage in common actions. Seeing disciplines as cultures helps to account for what and how issues can be discussed and for the understandings which are the basis for cooperative action and knowledge-creation.

Given the social nature of academic discourse, it is possible to look at some of its features in terms of how the social relations within the academic communities are negotiated. Myers (1989), for example, showed how pragmatic conventions of politeness are negotiated, even within scientific writing.

Summary

As the above discussion shows, conceptions of genre – literary and nonliterary – vary according to the interests of the analysts. Literary theorists are concerned with the categorization of literary texts and how their conventions are elegantly maintained or wittily subverted. Linguists are concerned with the relation of texts to context and focus in particular on the predictability or unpredictability of elements of the text. As a result, some analysts have focused on the descriptions of highly predictable, ritual, transactional texts, many of which seem banal in nature, such as recipes (Eggins, 1994) or reprint requests (Swales, 1990). More recently, there has been a greater attempt to identify generic patterns in less predictable interactional texts, such as casual conversation (Coupland, 2000; Eggins and Slade, 1997). In the systemic- functionalist tradition (e.g., Halliday and Hasan, 1989), the analyst collects comparable texts and attempts to find in them predictable, goal-oriented elements that are characterized by similar realizational patterns. The New Rhetoricians collect comparable texts and set them in a rich ethnographic context that attempts to account for the engagement of the individual text with the dynamic history of the genre to which it belongs. The applied linguists, whose concern is less to explain and more to teach generic conventions to novices, take from both of the other approaches and identify predictable 'moves' in generic texts while explaining their function with reference to the communicative purposes of the discourse community.

The concept of the community and its communicative needs has been central to recent conceptions of genre in linguistics. Even here, the notion of the discourse community has rapidly evolved from that of a static group of experts with clearly defined goals. The discourse community is now perceived as a diffuse group of individuals with different levels of expertise and changing social relations, whose communicative needs more or less coincide at different points of time. The logical extension of this line of thought is to consider how individuals understand genres. Chilton and Schäffner (2002: 20) wrote

> Participants in a linguistic interaction conceive of the interaction as being of a certain kind, as proceeding according to certain patterns of linguistic interaction that they have conceptualized in memory, and in which they may be more or less skilled. The conceptualization and its deployment in the ongoing activity define that activity: There is no genre form independent of the participants' conceptions and preconceptions.

There is truth in this assertion, or systemic functionalists, New Rhetoricians, and applied linguists could not begin to group together those texts that they believe belong to the same genre and begin their analysis. However, genre analysis can be conducted with reference to the individual's knowledge and expectations, the structure of the discourse communities in which he or she is situated, and the more-or-less conventional texts produced to serve those communities' communicative purposes.

Genres in Political Discourse

N Fairclough, Lancaster University, Lancaster, UK

© 2006 Elsevier Ltd. All rights reserved.

A 'genre' is a more or less stabilized and habitual linguistic way of acting and interacting, characterized by a distinctive linguistic form or structure, associated with specific communicative purposes, and with particular social or institutional contexts (Swales, 1990; Bhatia, 1993). For instance, giving a speech, conducting an interview, and having a debate are all types of political genre. The category of 'genre' is related to what some scholars call 'text type' (de Beaugrande and Dressler, 1981), and to 'activity type' (Levinson, 1979). Analysis of the linguistic forms of genres sometimes focuses on 'generic structures' (Halliday and Hasan, 1989), the overall organizational pattern that distinguishes one genre from another, seen in terms of particular elements (or 'stages') occurring in a particular order – for instance, news reports in the press characteristically consist of a headline, plus a lead paragraph that summarizes the story, plus a variable number of 'satellite' paragraphs that fill out details. Bell and van Leeuwen (1994: 124–177) analyze "adverserial political interviews" in this way. Other more cognitively oriented research analyzes the characteristic topical structures of genres in terms of macrostructures and macrotopics (van Dijk, 1980). Genres also have distinctive features of linguistic form at other levels of analysis. For instance, the organization of 'turn-taking' (the distribution of turns at talking between participants) in political interviews is different from that in doctor-patient consultations (Heritage and Greatbatch,

Braudy L (1985). 'Genre: the conventions of connection.' In Mast G & Cohen M (eds.) *Film theory and criticism: introductory readings*, 3rd edn. Oxford: Oxford University Press. 411–433.

Genres in Political Discourse

N Fairclough, Lancaster University, Lancaster, UK

© 2006 Elsevier Ltd. All rights reserved.

A 'genre' is a more or less stabilized and habitual linguistic way of acting and interacting, characterized by a distinctive linguistic form or structure, associated with specific communicative purposes, and with particular social or institutional contexts (Swales, 1990; Bhatia, 1993). For instance, giving a speech, conducting an interview, and having a debate are all types of political genre. The category of 'genre' is related to what some scholars call 'text type' (de Beaugrande and Dressler, 1981), and to 'activity type' (Levinson, 1979). Analysis of the linguistic forms of genres sometimes focuses on 'generic structures' (Halliday and Hasan, 1989), the overall organizational pattern that distinguishes one genre from another, seen in terms of particular elements (or 'stages') occurring in a particular order – for instance, news reports in the press characteristically consist of a headline, plus a lead paragraph that summarizes the story, plus a variable number of 'satellite' paragraphs that fill out details. Bell and van Leeuwen (1994: 124–177) analyze "adverserial political interviews" in this way. Other more cognitively oriented research analyzes the characteristic topical structures of genres in terms of macrostructures and macrotopics (van Dijk, 1980). Genres also have distinctive features of linguistic form at other levels of analysis. For instance, the organization of 'turn-taking' (the distribution of turns at talking between participants) in political interviews is different from that in doctor-patient consultations (Heritage and Greatbatch,

1991). And there are genre differences in intertextuality – the way one text is connected with others – for example, scientific articles and political reports in newspapers represent the words of others in different ways (de Beaugrande and Dressler, 1981).

Pragmatic research on genre focuses on the importance of contextual cues in the way people interpret texts. One approach is in terms of prototype theory (Rosch, 1973), which helps to explain why texts that differ in their linguistic structure from central instances of a particular genre may nevertheless be interpreted as instances of that genre on the basis of contextual cues – for instance, an article written by a scientist on the basis of scientific research in a scientific journal is likely to be interpreted as a scientific report, even if it differs linguistically quite markedly from most scientific reports (Paltridge, 1995).

Genre can be seen as one of three main analytical categories in discourse analysis: a genre is a way of (inter)acting, a 'discourse' is a way of representing particular aspects of the world (e.g., there are liberal, conservative, and social democratic discourses in the field of politics, which represent matters such as social welfare differently), and a 'style' is a way of being, an identity (e.g., there are different leadership styles in politics, such as the styles of British Prime Ministers Winston Churchill, Margaret Thatcher, and Tony Blair). Genres are best distinguished at the level of social practices that are relatively stable and durable over time, and particular concrete events, such as an actual political speech or interview, can be analyzed in terms of which genres and combinations of genres they draw upon. Much actual political text and talk is hybrid with respect to genres, i.e., combines different genres together (Fairclough, 1995a,b; Lauerbach, forthcoming).

An account of specifically political genres faces the difficulty that the field of politics is not unambiguously delimited but is socially constructed, and open to different competing constructions. The feminist slogan of the 1960s and 1970s, 'the personal is political,' is one indication of the difficulties here. Are we to assume a clear separation between the personal and domestic as elements of 'private' life, on the one hand, and politics as an element of 'public' life, on the other? Are gender relations in the household a form of political relation, or do political relations only obtain between the parties and factions of parliamentary politics? What about extraparliamentary movements and campaigns, such as those of environmental groups or protests against the policies of the World Trade Organization – are they a part of politics? Is there a clear distinction between politics and government, or politics and media, given that government is so much the target and focus of politics, and that so much of even parliamentary politics is now mediated through the press, television, and even the Internet? And are we to regard talk of the politics of organizations (such as businesses and universities) as merely a metaphorical appropriation of the term, or see the field of politics as including the many different types of organization as well as 'national' politics? What about local politics, international politics, and what is increasingly referred to as 'global' politics? How one defines and delimits politics is itself a political choice, and it determines how one delimits the genres of politics.

Here is a relatively broad view of politics, one that focuses on the political sphere as a distinct and partially institutionalized area of social life, and therefore excludes household politics and the politics of particular organizations, such as schools or workplaces. The political sphere, for purposes of this article, is that dimension of social life in which different social groups act in pursuance of their particular interests, needs, aspirations, and values. Political interaction between different social groups has both a cooperative character in that there is a search for a *modus vivendi* and a conflictual character in that there is a struggle for power (Chilton and Schäffner, 2002). They may do so at different scales (locally, regionally, nationally, and internationally), although it is the national scale that has received most attention in political theory and analysis, problematically, given the current growth of international political entities. Politics in this sense includes the political system (parliament, political parties, elections, structures of political communication, etc.), but also includes 'grassroots' or 'social movement' politics, and the 'mediatized politics' of the printed and broadcast media (Fairclough, 1995a). These are analytically distinguishable but overlap considerably in concrete events. The political sphere can be seen as the sphere that connects the state and the lifeworld (or 'civil society'), and one dimension of its internal heterogeneity is that it ranges from stabilized and institutionalized structures to unstable, fluctuating, emergent political tendencies and initiatives. Settled practices and vested interests precariously coexist with movements in and pressures from the lifeworld, and what counts as political (open to action in pursuance of alternative policies) shifts as areas of social life are politicized and depoliticized, brought into and taken out of the sphere of politics (Muntigl, 2002).

In accordance with this view of politics, political genres will be taken to include genres associated with the political system (e.g., parliamentary debate, political manifestos and programs, parliamentary or party conference speeches by political leaders, policy documents), mediatized political genres (e.g.,

political news reports, political interviews, political 'chat shows,' party political broadcasts, political advertising in the press and on billboards), the political public sphere (e.g., public meetings, campaign literature of social movements, political forums, and focus groups). The range of genres is thus extensive, and this list of examples is by no means exhaustive. Most of the literature has tended to focus on particular genres (political interviews and parliamentary debates have, for instance, received considerable attention), but there are arguments for also attending, particularly in the case of more institutionalized areas of politics, to 'chains' or 'networks' of genres that constitute the discourse dimension of political systems, the discourse 'technologies' so to speak of institutionalized politics. Thus, in the area of political communication there are systematic connections between, for instance, policy documents or major political speeches, press releases and news conferences, and reports in the media, and there are regular and predictable transformations in language as material is moved along such a chain of genres (Fairclough, 2003).

This article focuses on linguistic research on political genres (including linguistic, pragmatic, sociolinguistic, discourse, and conversation analysis), but it is important to acknowledge that various disciplines contribute to analysis of political genres, including political science and media studies. Very limited reference is made here to this broader body of research (Dryzek, 1990; Corner, 1995; Livingstone and Lunt, 1994), but research on political discourse in general and political genres in particular is most productively conceived as interdisciplinary analysis in which language and discourse analysts can make a specific contribution to political, cultural, and media research, while at the same time enriching themselves theoretically and methodologically through dialogue with other disciplines (Fairclough, 2000).

This articles focuses on four genres associated with the political system, mediatized politics, and the political public sphere: political interviews, political speeches, policy documents, and public sphere dialogues.

Political Interviews

Political interviews have attracted considerable research interest as the genre that has been most potent in the way television has transformed the character of politics in the past 50 years. The history of broadcast interview (Bell and van Leeuwen, 1994) shows a shift from deferential journalists putting tentative questions to distant and sometimes impatient politicians, to a situation in which journalists confidently and sometimes aggressively quiz or try to corner politicians, on behalf of the public as they commonly claim, while politicians have become accomplished television performers and even media personalities. The boundary between politics and media has radically shifted, and politics now has a thoroughly mediatized character.

One body of research on political interviews has adopted the method of 'conversation analysis' (Heritage and Greatbach, 1991; Clayman and Heritage, 2002). Conversation analysis focused initially on everyday conversation but increasingly has turned its attention to institutional talk in, for instance, doctor-patient interactions and news interviews, treating these as adaptations of everyday conversation to fit specific institutional purposes that reduce the diversity of features characteristic of the latter, and develop the normal conversational activities that are retained in specialized ways. For instance, features of 'turn-taking' (organizing the distribution and alternation of participants' turns at talking), which are a pervasive characteristic of conversation, are retained but in a distinctive form. Types of turn are distributed according to the institutional role of participants, most obviously in that it is only interviewers (IR) that ask questions, and interviewees (IE) that provide answers. IR questions are commonly preceded by statements that are standardly treated by IE as 'prefaces' to questions in that they do not respond to such statements but wait for a question before responding. There are features of the design of news interview talk which (a) achieve the 'task' that participants have to produce talk for an 'overhearing' news audience, talk that is addressed to an audience rather than addressed by IR and IE to each other (which would position the audience as 'eavesdroppers' on a conversation), and (b) meet the constraint that interviewers should "maintain a stance of formal neutrality towards interviewee statements and positions" (Heritage and Greatbatch, 1991: 106). For instance, 'response tokens' (such as 'yes,' 'oh,' 'really,' 'mm hm'), which are regularly produced in everyday conversation by co-participants in the course of an extended turn by one participant, are not produced by IR in the course of extended answers by IE, and, in withholding them, IR 'declines' the role of primary addressee in favor of the news audience. And IR questions that might be taken to be 'hostile' and therefore in breach of IR neutrality are generally not treated as expressing IR's opinion but are merely designed to solicit IE's viewpoint. Participants in news interviews overwhelmingly comply with such interactional norms.

Although conversation analysts emphasize that the norms of political interview are socially constructed and subject to social change, they have tended to

understate the diversity and variability of contemporary forms of political interview. I see this as a problem of levels, as I indicated earlier. Conversation analysts have described a genre of political interview that has been perhaps the dominant genre, one with a normative power in terms of what interviewers and interviewees tend to recognize as what they should do, one that has achieved a certain stability and durability at the level of the social practices of politics, which can constitute a powerful point of reference in actual political interviews but is not instantiated in any simple way within them. Actual events, actual text, and talk are more diverse and hybrid with respect to genres. One response to this is to distinguish different types and styles of political interview (Bell and van Leeuwen, 1994), but clear-cut typologies are difficult to arrive at. Another approach is to recognize that although there is a measure of stabilization of types and styles (including the personal styles of leading broadcast journalists), political interviews as events are performances that variably, and more or less innovatively, draw upon and combine genres which have a certain stability and uniformity at the level of social practices (Fairclough, 1995a,b; Lauerbach, forthcoming).

Bell and van Leeuwen (1994) analyze one particular type of political interview, the 'adverserial' political interview, in terms of its generic structure, seeing it as made up of the following 'stages': (a) greeting, (b) soliciting opinion, (c) checking, (d) challenging, (e) entrapment, and (f) release. The interview begins on a cooperative note, with the interviewer as host greeting the interviewee as guest. The interviewer then asks an 'open' question giving the interviewee the chance to state his views in the way that he wants to ('soliciting opinion'). The shift from cooperation to contest begins with 'checking,' in which the interviewer prepares the ground for challenges by checking facts and figures. The interviewer then moves onto the offensive by confronting the interviewee with statements that contradict or weaken the latter's position ('challenging'). 'Entrapment' is a sort of verbal checkmate, a statement with which an interviewee can neither agree nor disagree without damaging his or her position. The final stage is 'release,' a return to cooperation, in which the interviewer asks a question (often dealing with future prospects or aims) that the interviewee is allowed to answer without challenge. Some of these stages may be absent from adversarial interviews – the interviewer may move straight into challenges after the greeting – and the central stages occur recursively (e.g., there may be several sequences of challenge and entrapment). Although the whole of such an interview consists of a series of questions and answers, the interviewer's questions vary in their linguistic form and in their illocutionary force in different stages of the interview. Their analysis thus moves toward forms of pragmatic analysis, which are more fully developed in other research (e.g., Fetzer, in Chilton and Schäffner, 2002), in which the focus is on the relationship between what is said and what is meant, and on such specific issues as directness and indirectness, politeness and impoliteness, and presupposition.

Fairclough (1995b) is an analysis of a political panel interview in the course of an election campaign between a television journalist and representatives of the three main British political parties. The focus is on genre hybridity, on the slippage between conventional political interview of the type described by Heritage and Greatbatch (1991), everyday conversation, and an entertainment genre that at points approximates a comedy routine. Such genre hybrids are a general characteristic of mass media and a specific characteristic of mediatized political genres. They are a facet of the fluid and shifting character of the political sphere, that is, of its shifting relations with other spheres, including those of the media and of everyday life (the 'lifeworld'). Another example is political 'chat shows,' in which politicians engage in 'chat,' – conversational language specialized for purposes of entertainment – rather as film stars or pop idols do (Livingstone and Lunt, 1994; Fairclough, 1995a).

Political Speeches

I referred at the beginning of this article to the common view of the 'generic structure' of genres – particular elements occurring in a particular order. I also defined a 'genre' as a more or less stabilized and habitual linguistic way of acting and interacting. These 'elements' are characteristically themselves actions – so that a genre is a way of (inter)acting, which is composed of constituent actions. However, the assumption that these constituent actions are necessarily strictly ordered is not sustainable. They are in highly ritualized genres (e.g., the official opening of a new parliamentary session), but this is not a defining feature of genres as such. For instance, Graham, Keenan, and Dowd (2004) analyze historical continuities in 'call to arms' speeches from Pope Urban II (1095) to George Bush (2001). They identify four 'generic features' of such speeches: (1) an appeal to a legitimate power source that is external to the orator, and which is presented as inherently good (e.g., God, or the nation), (2) an appeal to the historical importance of the culture in which the discourse is situated, (3) the construction of a thoroughly evil Other (e.g., terrorism), and (4) an appeal for unification behind the legitimating external power source.

The authors analyzed some 120 of such speeches, and the particular realization, including the particular ordering of these generic elements, is predictably variable.

A different approach to analysis of political speeches is based on 'functional pragmatics,' which aims at reconstructing the 'deep' actional structure of texts through analysis of their textual 'surface.' Sauer (2002) analyzes one of a series of commemorative speeches (British Prime Minister John Major's speech) given by senior politicians on the 50th anniversary of the allied victory in World War II. One focus of his analysis is the 'importation' of textual elements into this primarily epideictic address (eulogy), which gives it a heterogeneous character, including a mixture of genres. Specifically, these are elements of Conservative Party neoliberal ideology that introduce the genre of party political speech. Sauer (p. 131) also notes a 'populist' element that enters through "the classical rhetorical technique of contrasting sublimity with popular expressions" (e.g., "We are, as it were, still rubbing our eyes after 1989 wondering if it can be real"), a characteristic I also identified in Tony Blair's speech on the occasion of Princess Diana's death (Fairclough, 2000). Such 'conversationalization' of political language is pervasive in contemporary politics.

Muntigl (2002) focuses on the innovative political work that is done in major political speeches, specifically the 'politicization' of certain issues in the sense of constituting them as issues for political debate, and the 'depoliticization' of others. He analyzes a speech by the European Commissioner responsible for employment, industrial relations, and social affairs, Commissioner Flynn, in which employment policy at a European Union (EU) level is opened up as a political issue (politicized), but, at the same time, is depoliticized by projecting the particular policies adopted by the EU as the only possible ones, ruling out alternatives. Muntigl's analysis includes the generic structure of the speech, and semantic and grammatical analysis of how particular social groups and their policy positions are positioned in relation to each other. I adopted a similar approach to a major policy speech of Tony Blair on the "new international community" at the time of the Kosovo war (Fairclough, 2000), showing how the speech constituted 'the international community' as a new and only apparently inclusive actor in international affairs and especially military interventions in the affairs of sovereign states, which could be interpreted in Muntigl's terms as the simultaneous politicization of interventions on claimed 'humanitarian' grounds and their depoliticization through excluding alternatives to the particular policies proposed. In both cases, one can see an important element of the action of such policy speeches in terms of space: 'carving' out a new EU space for employment policy interventions, and a new 'global' space for military interventions on the part of a largely self-appointed 'international community' (in effect, the United States and its allies). In discourse analytical terms, this political genre contributes to the emergence and hegemony of new discourses.

Policy Documents

Discussed here briefly is work on the genesis of policy documents within the EU (Wodak, 2000), which draws attention to a complex collective and negotiated process of production associated with this genre (as also with other political genres, such as political news reports). Successive drafts of the policy document were debated and altered in the EU Competitiveness Advisory group, which consists of representatives of the employers and the trade unions, as well as some politicians and bureaucrats. This analysis locates this one genre as an element in a chain or network of genres (including committee meetings, expert opinions, documents of the EU Commission) and points to relations of recontextualization between such genres, and to the characteristic transformations that take place as elements are moved from one genre (e.g., committee discussion) to another (e.g., the policy document). One aspect of these relations of recontextualization is their 'filtering' effect: things that can be said in a meeting cannot be directly recontextualized in a policy document.

Public Sphere Dialogues

My fourth example illustrates most clearly the potential of interdisciplinary research on political genres. The foundational work of the social theorists Jürgen Habermas and Hannah Arendt on the public sphere has made it clear that the question of the public sphere is centrally the question of what forms of dialogue are available for public deliberation. Their work has been developed by Dryzek's studies of 'deliberative democracy'; the final chapter of Dryzek (2000) can be interpreted as a normative discussion of the genre of public sphere deliberation or dialogue. None of these theorists is a linguist, so what they say about public sphere dialogue is merely schematic from a linguistic point of view. However, their work can be 'operationalized' in the analysis of actual dialogues in a way that fruitfully combines social theory and analysis of discourse and genre.

The 'critical' analysis of discourse has often focused on negative critique – a critique of the dominant forms (including genres) of discourse. However, part of the objective of critical analysis is also 'positive'

critique – the normative specification of alternatives, not in a purely hypothetical way, but on the basis of forms that actually exist, if often in a marginalized way. In the case of public sphere dialogue, one can specify normative generic conditions on the basis of (to give the familiar term an ironic twist) 'best practice,' and evaluate actual dialogues in terms of these normative conditions (Fairclough, 1999). On the basis of the theoretical work on the public sphere discussed earlier, the following characteristics of good public sphere dialogue can be specified:

- Regulation: maximally open to diverse discourses and voices, interaction jointly managed by all participants
- Emergence: new individual, collective (as members of groups) and universal (as citizens, and human beings) identities can emerge
- Action: as Arendt (1998: 200) puts it, "power is actualised where word and deed have not parted company" – good public sphere dialogue leads to action, has effects on the world

Although these characteristics are formulated in an abstract way, their presence or absence in dialogue can be measured in more precise analytical terms – for instance, with respect to the first characteristic, the form of management of interaction can be specified in terms of features of turn-taking. The third characteristic points to the question of how public sphere dialogue is positioned in genre chains or networks, and it indicates that particular institutionalized regimes of governance have a partly discourse character – specifically, in this case, the existence (or nonexistence) of systematic procedures for feeding public dialogue and deliberation into policy-making processes can be seen as partly a matter of the existence of established relations of recontextualization between the genre of public sphere dialogue and the genres of policy making.

Conclusion

A vast amount has been written on political genres, including traditional and more modern forms of rhetorical analysis of especially political speeches. This article has drawn selectively from more recent research. I highlight two characteristics of political genres that have been relatively neglected but are crucial if genre and discourse analysts are to make an effective contribution to political research.

The first is the fluid and shifting character of political genres, their hybrid character, and their openness to new forms of hybridity. Politics is in a sense a 'space between,' a social sphere that, on the one hand merges into the structures of the state and the market, and, on the other, connects with the more open and diverse sphere of the 'lifeworld,' everyday life. Relations between politics and business, media, leisure, and so forth fluctuate as part of processes of social change. For instance, there is a common view that the 'official' politics of the political system has become moribund as states have begun to function more as facilitators for the emergent 'global' form of 'hypercapitalism' – real policy options have ceased to exist, old differences in political ideologies have become meaningless – and one can see the increasingly mediatized character of politics, its increasing focus on leaders who are effective television personalities, its preoccupation with image at the expense of political 'message,' as discourse facets of what are arguably structural changes.

The second is the interconnection of political genres, the relations that are contracted between them in genre chains or networks, the relations of recontextualization that obtain between them, and the linguistic transformations entailed when, for example, material from committee meetings is recontextualized in policy documents. This focus accords with the partly institutionalized character of politics as political system, including pressures to incorporate the public sphere (e.g., the contemporary integration of 'focus groups' into the political apparatus) and 'lifeworld' politics (e.g., various originally activist NGOs, which have become institutionalized). The political sphere is germane to the constitution of 'regimes of governance' on different scales ('global,' macroregional, e.g., the EU, national, and local), which regulate (with varying degrees of success) social interactions, relations, and identities. And such regimes of government have a partly discourse character, which is best captured by seeing them as distinctive networks of genres. Especially in the context of increasing 'globalization,' in which such regulation operates with extreme rapidity across vast distances of social space and across scales, networks of political genres are an inherent part of regimes of government.

Georgia (capital Tbilisi) officially occupies 69 500 square kilometers in northwest Transcaucasia. It lies between longitudes 40°05′ and 46°44′ east, and latitudes 41°07′ and 43°35′ north, bordering the Russian Federation, Azerbaijan, Armenia, Turkey, and the Black Sea. The last census covering this entire territory took place during the final years of Soviet rule in 1989. The main figures are presented in **Table 1**.

But two areas have been *de facto* independent of the central government for most of the period since the collapse of the USSR (1991): the former Autonomous Republic of Abkhazia (capital Sukhum) in the northwestern triangle of Transcaucasia, and the former Autonomous Region of South Ossetia (capital Tskhinval), to the south of Russia's North Ossetian republic across the main chain of the Caucasus mountains. Georgia's population (as of 2004) is lower than the 1989 figure partly because of post-1991 emigration (non-Georgians leaving largely because of ethnic

tensions; Georgians themselves abandoning the homeland for economic betterment), and partly because of the loss of the afore-mentioned territories, whose own populations are reduced as a result of the respective wars with Georgia in the early 1990s (1990–1992 for South Ossetia; 1992–1993 for Abkhazia). The draft of a Georgian Language Law, which was published in 1988, with its requirement that all entrants to higher education in the republic be able to pass a test in Georgian language and literature, was a contributory factor to the ethnic strife that began to scar the body politic in the last years of Soviet communism. Many members of certain ethnic minorities, generally living compactly around Georgia's borders, tended to have little or no knowledge of Georgian.

The 1989 figures for both the basic number of Georgians and the almost 100 percent registering fluency in the mother tongue are vitiated, because since 1930, the term 'Georgian' has been used to include all of the Kartvelian peoples. The groups that fall under that title are Georgians proper (in Georgian *kartvel-eb-i*), the related Mingrelians (in Mingrelian *margal-ep-i*), the Svans (in Svan *shwan-är*), and the relatively few coastal Laz (in Laz *laz-epe/ch'an-epe*) residing here (the bulk of the Laz live along the northeast Turkish littoral). The Georgian language lacks a superordinate term for these four peoples, while 'Kartvelian' is the natural choice in English, given the expression "Kartvelian languages" (in Georgian *kartvel-ur-i en-eb-i*) as a synonym for "South Caucasian languages." The entire North Central Caucasian Bats (Ts'ova-Tush) community of ca. 5000, concentrated in the east Georgian village of Zemo Alvani, are also so categorized.

All of the Svans (circa 55 000, centered in the high valleys along the Ingur and Tskhenis-ts'q'ali rivers in western Georgia) and most of the Mingrelian-speaking Mingrelians (about half a million, in the western Georgian lowlands) have Georgian as their second (literary) language through receiving their education in Georgian-language schools. No widespread knowledge of Georgian among Svans or Mingrelians should be assumed for pre-Soviet times, despite Georgian's role as the language of worship in the Georgian Orthodox Church. Only between Mingrelian and Laz is there any degree of mutual intelligibility within the Kartvelian family; native scholars treat them as co-dialects of the so-called Zan language.

Though they never gained the status of permanent literary languages during the Soviet period, a number of books, journals, and newspapers were produced in Mingrelian from the late 1920s to 1938 (Enwall, 1992), and a language-primer was even published in Sukhum for the few Soviet Laz residents in 1935 (Feurstein, 1992). Otherwise, the only publications in these languages (and Svan) were designed for linguists and/or folklorists, rather than the native speakers themselves, who were obliged to view themselves as Georgians (hence the post-1930 census-classification). During Soviet times all Svans and most (Laz-)Mingrelians were educated in Georgian-language schools, where instruction was in Georgian and their true mother tongues were not taught; in such schools Russian was also taught from the first grade.

Russian was likewise taught *ab initio* in Armenian-, Azeri-, Ossetian- and Abkhaz-language schools (these being the other literary languages found in Georgia, in addition to Russian), while in Russian-language schools tuition was in Russian, with Georgian introduced from grade 3 (though Abkhaz became the optional second language in such schools from 1981–1982; see Hewitt, 1989). No Chechen-language schools seem ever to have been established to cater for the Chechen-speaking Kist' population of the P'ank'isi Gorge in eastern Georgia.

Georgia's independence, combined with Georgians' well-known antipathy towards Russia, has meant a drastic diminution in the teaching of Russian within Georgia proper, such that knowledge of it can no longer be taken for granted among the post-Soviet generation. According to the latest information available (2004), there were 86 Russian, 127 Armenian, 117 Azeri, and 73 mixed schools subordinate to the Ministry of Education (plus 2023 Georgian schools), and in all of them Georgian is taught from grade 1. Within South Ossetia and Abkhazia it is essentially the Soviet system that still applies, though the Abkhazian authorities do not sanction the teaching of or in the Georgian language, as reportedly desired by the republic's Kartvelian (mostly Mingrelian) residents, concentrated in the southeasternmost Gal District; Abkhazia's main *lingua franca* is Russian.

With the post-independence rise of private publishing, a number of Mingrelian publications have appeared for popular consumption. Within Abkhazia a trilingual (Russian, Mingrelian, Abkhaz) newspaper (*Gal*) has been established, and one periodically hears calls for the establishment of full literary status for this language, a move that is strenuously discouraged in Tbilisi because of the perceived threat of the political separatism that might follow.

Georgia also has small communities of speakers of Greek, Assyrian, and some Daghestanian languages (e.g., Udi). Whilst Bats is actually moribund, Udi, Svan, Laz (even in Turkey), and Abkhaz are endangered (as Mingrelian will be in the longer term, since it has been losing ground from the east to

Georgian since the 19th century), unless appropriate measures are taken.

Georgian

B G Hewitt, SOAS, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Georgian is spoken in the Republic of Georgia, the Zakatala district of Azerbaijan, the historical Georgian regions of northeastern Turkey, by descendants of Georgians transplanted to Fereydan in Iran by Shah Abbas (17th century) and by émigré communities established in such countries as France following sovietization but growing in Russia and beyond since the collapse of the USSR in 1991.

The Georgian language (*kartuli ena*) belongs to the Kartvelian (South Caucasian) family (*see* **Caucasian Languages**). Georgian possesses a number of dialects, which can differ sharply from both one another (e.g., western Gurian versus northeastern Khevsurian) and the literary standard. The latter is in some respects still in the process of regularization but is based on the central Kartlian dialect, in which region lies the capital, Tbilisi (formerly T'pilisi).

The language is customarily periodized as Old Georgian (5th–11th centuries) → Mediæval (12th–18th centuries) → Modern (post-1800). Iranian, more recently Russian, and now English lexical influences are marked; Greek, Armenian, Arabic, and Turkish loans have also penetrated.

The oldest inscription dates from circa 430 AD at a site near Bethlehem. Within Georgia, the church at Bolnisi boasts an inscription dated to 494. Iak'ob Tsurt'aveli's "Martyrdom of Shushanik," apparently composed between 476 and 483, represents the first work of native literature, while the oldest dated manuscript (the Sinai Polycephalon) hails from 864. The earliest survivals exhibit peculiarities in the marking of the third person indirect object/second person subject, from which they are styled *xanmet'i* 'with extra *x*' or *haemet'i* 'with extra *h*'; the nature of this distinction (diachronic versus dialectal) has been hotly debated. Little seems to have been written during the centuries of Mongol and Tatar depredations.

Georgian is written in a unique, wholly phonemic alphabet with 33 characters from left to right without any upper- versus lower-case distinction. The modern script *mxedruli* 'military; secular' evolved in the 11th century from its precursor *k'utxovani* 'angular.' This in turn developed in the 9th century from the oldest variant *mrg(v)lovani* 'rounded,' which was probably devised in the 4th century AD on the model of Greek to facilitate the spread of Christianity, adopted as the official religion by King Mirian of Kartli during the 330s. Even after the 11th century, religious texts continued to be written in a combination of the two earliest scripts, called *xutsuri* 'ecclesiastical,' such that the oldest served as the majuscule (*asomtavruli*) to the minuscule (*nusxuri*) of its successor.

Modern Georgian has 28 consonants plus five vowels (**Tables 1** and **2**).

Old Georgian additionally had the voiceless uvular plosive /q/, which in standard Georgian has merged with the voiceless back fricative, plus the palatal glide /j/, sounds retained in Svan. Circumfixes abound.

The oldest inscription dates from circa 430 AD at a site near Bethlehem. Within Georgia, the church at Bolnisi boasts an inscription dated to 494. Iak'ob Tsurt'aveli's "Martyrdom of Shushanik," apparently composed between 476 and 483, represents the first work of native literature, while the oldest dated manuscript (the Sinai Polycephalon) hails from 864. The earliest survivals exhibit peculiarities in the marking of the third person indirect object/second person subject, from which they are styled *xanmet'i* 'with extra *x*' or *haemet'i* 'with extra *h*'; the nature of this distinction (diachronic versus dialectal) has been hotly debated. Little seems to have been written during the centuries of Mongol and Tatar depredations.

Georgian is written in a unique, wholly phonemic alphabet with 33 characters from left to right without any upper- versus lower-case distinction. The modern script *mxedruli* 'military; secular' evolved in the 11th century from its precursor *k'utxovani* 'angular.' This in turn developed in the 9th century from the oldest variant *mrg(v)lovani* 'rounded,' which was probably devised in the 4th century AD on the model of Greek to facilitate the spread of Christianity, adopted as the official religion by King Mirian of Kartli during the 330s. Even after the 11th century, religious texts continued to be written in a combination of the two earliest scripts, called *xutsuri* 'ecclesiastical,' such that the oldest served as the majuscule (*asomtavruli*) to the minuscule (*nusxuri*) of its successor.

Modern Georgian has 28 consonants plus five vowels (Tables 1 and 2).

Old Georgian additionally had the voiceless uvular plosive /q/, which in standard Georgian has merged with the voiceless back fricative, plus the palatal glide /j/, sounds retained in Svan. Circumfixes abound.

Table 4 Correlation of agreement pattern, verb type, and verb series

	Series I	*Series II*	*Series III*
Type I	β	α	γ
Type II	β	β	β

Verbs divide into transitives, intransitives, 'medials,' indirects (with logical subject in the dative), and a small stative class; 'medials' often appear intransitive but largely behave morphosyntactically like transitives because the relevant forms are borrowed from corresponding transitive paradigms. Georgian (with Svan) preserves the feature, assumed to have characterized Proto-Kartvelian, whereby a transitive verb's arguments are case-marked in one of three ways determined by which of three tense-mood-aspect (or *screeve*) series the given form displays. Verbs can agree with up to three arguments by virtue of the presence of two sets (A and B) of pronominal agreement affixes. The patterns of morphosyntactic behavior (with subscripts indicating affixal agreement) are (Table 3) distributed as follows (where the transitives and 'medials' are combined as Type I verbs, while intransitives, indirects, and statives are subsumed under Type II) (Table 4).

The examples below demonstrate that, while case marking in Series II follows ergative alignment, affixal agreement is accusative, creating a split-ergative configuration. Although the Series III pattern might appear to be a better candidate for illustrating ergativity, this inverted construction developed relatively late across Kartvelian out of a past (essentially intransitive) resultative. No unique Ergative morph can be reconstructed for proto-Kartvelian. The system is illustrated by the transitive 'The shepherd (a) will toss$_\beta$, (b) tossed$_\alpha$, (c) (has) apparently tossed$_\gamma$ food down for his flock' versus the intransitive 'The priest (d) will drown$_\beta$, (e) drowned$_\beta$, (f) (has) apparently drowned$_{\beta'}$, where (a/d) represent Series I, (b/e) Series II, (c/f) Series III:

The languages to have undergone most Georgian influence are naturally its congeners, Mingrelian and Svan, plus other Transcaucasian neighbors, notably Bats, Iranian Ossetic, Indo-European Armenian, and Northwest Caucasian Abkhaz. As a feudal power throughout the Caucasus and source for the spread of Christianity to the north Caucasus before the coming of Islam, Georgian has left some lexical traces here, too.

This article is reproduced from the previous edition, volume 3, p. 1419, © 1994, Elsevier Ltd.

Georgiev was born on February 16, 1908. He went to school in Varna and then studied classics at Sofia University. Between 1933 and 1948 he had various study periods in universities outside Bulgaria: Vienna (1933–1934) where he studied the ancient languages of Asia Minor under Kretschmer; Florence and Berlin (1939–1940); Paris after World War II (1947). In 1948 he was appointed professor in Sofia, under Mladenov. He was very early on interested in Indo–European (I–E) and Proto-I–E (Pelasgian, Etruscan, Mycenean, Thracian, Hittite, Luvian) and in Balkan toponymy. He frequently challenged accepted views and put forward controversial theories, especially in relation to the Balkans. He worked intermittently for nearly 30 years on Etruscan, and published a summary of his findings in two volumes (Georgiev, 1970–1971), in which he maintained that there was a clear connection between Etruscan and Hittite (the question is still open). The Thracian presence in the Balkans – its effect on later Slavonic, especially as spoken by the Bulgarian population (e.g., an important dialect difference between Western and Eastern Bulgarian, the treatment of Common Slavonic *jat*' as *e* or *e/ja*, respectively, follows approximately the line of the Moesian–Thracian frontier), as well as the Thracian origin of much of the Balkan toponymy – was another of Georgiev's abiding interests, and culminated in his 1977 publication *Trakite i tekhnijăt ezik* (*The Thracians and their language*). On the question of the division of the I–E languages he argued that the traditional *centum/satəm* was irrelevant, and that six main divisions should be recognized: (a) Northern – Germanic, Balto–Slavonic, Tocharian; (b) Western – Celtic, Italic, Venetic, Illyrian, Messapic, Lepontic, Ligurian, Rhetic; (c) Central – Greek, Macedonian Phrygian, Armenian; (d) Eastern – Daco–Moesian, Albanian, Indo-Iranian; (e) Southern – Thracian, Pelasgian, Termilian (Lycian); (f) Hittite, Luwian, Lydian, Etruscan, Carian, Eteocretan (Linear A). As with many I–E questions relating to very early times and dependent on very scanty evidence, theories abound and provide a happy hunting-ground for hypotheses. Georgiev was far from having resolved all the problems he surveyed, but his learning was solid and his provocative stances gave a special zest to I–E studies.

In terms of speaker numbers, German is the most important language in western and central Europe. With English, Dutch, and Frisian (Western Frisian; Northern Frisian), it belongs to the western group of the Germanic languages. In its standardized form, however, it is linguistically more conservative, having retained more of the synthetic morphology of the common ancestor. Its dialects exhibit immense variation, with a low degree of mutual intelligibility, and the standard form emerged relatively late as a consequence of the political fragmentation of central Europe.

The Speakers of German

With approximately 100 million speakers, German ranks 10th among the languages of the world, and it is the most widely spoken language in the European Union in terms of first-language speakers. Within Europe, it is exceptional in terms of the number of countries in which it is spoken. The largest proportion is in the Federal Republic of Germany (80 million), followed by Austria (7.5 million), German-speaking Switzerland with Liechtenstein (4.5 million), and Luxembourg (350 000). German also has some official status as a regional language in Belgium, Denmark, Hungary, Italy, and Romania, and there are significant German-speaking minorities in the Czech Republic, France, Poland, Slovakia, and a number of the successor countries to

the Soviet Union, notably Kazakhstan. However, where German-speaking minorities lack official status, the number of speakers is generally in decline.

Outside Europe, there are over a million active users of German in the United States and significant numbers in Argentina, Australia, Brazil, Canada, Namibia, South Africa, and a few other South and Central American countries. These numbers are now declining quite rapidly as German speakers assimilate to the majority linguistic community.

German has a few significant offshoots. The only example of a German-based creole was in Rabaul (Unserdeutsch, spoken in New Britain), but this is now vestigial. Pennsylvania Dutch (Pennsylvanish), deriving from Palatinate dialects, is spoken in parts of Pennsylvania, Ohio, and Ontario, although it is in decline outside closed religious communities such as the Amish. Since the Second World War, the local dialects of Luxembourg have no longer come to be perceived by their speakers as forms of German, and a standard Luxembourgish (Luxembourgeois) is becoming established. The most important language to have developed from German, though, is Yiddish, whose origin was the medieval German spoken in Jewish communities in central and southern Germany but that has subsequently developed into a distinct language, with a syntax and vocabulary unlike that of any variety of German.

The History of German

Modern Standard German (customarily referred to as *Hochdeutsch*, or High German) arose from the West Germanic dialects spoken by a number of peoples (Franks, Alemannians, and Bavarians) who settled between the north German plains and the Alps in the first centuries A.D. These dialects came to differ from other forms of West Germanic, and especially from the Low German dialects of the northern plains, through the consonant changes that are known collectively as the Second (or High German) Sound Shift. Because of this change, inherited voiceless plosives became affricates or fricatives (depending on whether they were word-initial or not), as illustrated by the pairs of cognates from English (which retained the original West Germanic consonants) and modern German in Table 1.

Table 1 Second sound shift: English and German cognates

English	*German*
pepper	Pfeffer
tin	Zinn (<z> = [ts])
water	Wasser
book	Buch (<ch> = [x])

There are continuous written records in varieties of High German from the second half of the 8th century, and the history of the German language is usually divided into four major periods. Relatively few texts, mainly of a religious character, have survived from the first period (750–1050), known as Old High German, because Latin was the dominant language of literacy. The Middle High German period (1050–1350) saw some development of secular writing, notably in the form of chivalric verse on French models. The linguistic territory was extended during this period as High German settlers moved east across the Elbe.

The third period, Early New High German (1350–1650), saw the beginnings of a slow process of standardization. Up to this time, numerous regional varieties had been used in writing, but, with the invention of printing, certain variants started to be used more widely than in their region of origin. This development was aided by the Reformation and the prestige of Luther's writings, especially his Bible translation, which often proved decisive in the preference for a particular variant over competing forms. In this way, the process of selection, as the first stage in the process of standardization, had been largely completed by the mid-17th century, and a relatively uniform High German was being used for writing in central Germany and, significantly, also in the north, where it supplanted the native Low German.

The process continued into the fourth, New High German period (1650 on) as this written variety was codified in terms of grammar, orthography, and lexis. Crucially, in the course of the 18th century, this variety gained acceptance in Catholic south Germany, Switzerland, and Austria, which had resisted a variety associated with Lutheranism and retained regionally based norms. Nevertheless, *Hochdeutsch* long remained a primarily written variety, with local dialect being the norm in speech. By the middle of the 19th century, however, a prestige pronunciation had arisen based on the north German tradition of speaking written High German precisely as it was spelled. This was formally codified for use on the stage in 1898, and it has subsequently been adopted by a majority of speakers as a spoken supraregional norm.

The Structure of Modern Standard German

Sounds and Spelling

Among the noteworthy features of German phonology is the existence of a set of affricates, specifically a labial /pf/ and dental /ts/, which have (controversially)

been analyzed as single phonological units. There is also a set of front rounded vowels, as in *fühlen* [fyːlən] 'feel,' *böse* [bøːzə] 'evil.' The opposition of voicing in obstruents is neutralized in syllable-final position, as in *ich sage* [zaːgə] 'I say' but *ich sagte* [zaːktə] 'I said.'

A striking feature of German orthography is the capitalization of nouns. Otherwise, it is broadly phonemic, if not precisely so. In particular, the tense/lax distinction in vowels is not marked in a uniform way, and there is a general principle that root morphemes retain a consistent spelling wherever possible. The Latin alphabet is used, with some modifications, specifically the symbol <ß>, used for /s/ in some words, and the umlaut symbol, which assists in maintaining the consistent orthographic shape of roots. The spelling of German was reformed in 1996 (after the initial codification in 1902) with the aim of eliminating inconsistencies. This reform has generated considerable controversy that is still ongoing, but the changes are relatively slight and chiefly affect the use of the symbol <ß> and punctuation.

Morphology

German is the only West Germanic language to retain extensive inflectional marking of grammatical categories, although the nature of this marking has often changed. The four noun cases, for example, are now marked primarily through the inflection of the determiner and/or the adjective, as in *der Mann* 'the man':

NOM: der Mann

ACC: den Mann

GEN: des Mannes

DAT: dem Mann

The three genders of the noun can only be identified through agreement and do not correlate consistently with any phonological or semantic features of the noun itself, for example, *der Band* 'the volume' (masculine), *die Hand* 'the hand' (feminine), *das Land* 'the country' (neuter).

German makes extensive use of vowel changes in inflection. Ablaut in the strong verbs (e.g., *singen* 'sing,' past *sang*. past participle *gesungen*) is found in other Germanic languages, but German has also morphologized the vowel fronting alternations known as umlaut in several functions, for example, in noun plurals (*der Bruder* 'the brother,' *die Brüder* 'the brothers'), the subjunctive (past indicative *ich war* 'I was,' past subjunctive *ich wäre*), and adjective comparison (*groß* 'big,' *größer* 'bigger').

Syntax

A striking aspect of German syntax is the position of the finite verb. In main clause statements it is the second constituent, but in questions it occurs first and in subordinate clauses it occurs finally. In verb-second and verb-initial clause types, any non-finite components of the verb phrase are placed finally, forming what German linguists term a 'bracket construction' enclosing the other constituents:

deinen	Bruder	**habe**	ich	zufällig
your	*brother*	*have*	*I*	*by chance*

gestern	in	der	Stadt	**gesehen**
yesterday	*in*	*the*	*city*	*seen*

'I have by chance seen your brother in the city yesterday'

The preverbal position constitutes a topic slot that can be filled by any appropriate constituent. The position of other clause-level constituents depends on communicative criteria. The syntax of German has thus often been considered to be characteristically flat (Kathol, 2001), although a more conventional view is that it is an underlyingly SOV language, with the finite verb being moved into second position.

Regional and Social Variation in German

The German speech area exhibits much geographical variation, with significant linguistic differences among distant regional dialects. The area can be seen as a dialect continuum from the Alps to the coast, with the most important division being between the High German dialects of the center and south, which participated in the Second Sound Shift, and the Low German dialects of the north, which did not. The Low German dialects are closer to standard Dutch than standard German, but these areas adopted standard (High) German as their language of literacy in the 17th century. The major dialect groups within High German are West Central German (in the Rhinelands and Hesse), East Central German (in Thuringia and Saxony), Bavarian (including most of Austria), and Alemannic (in the southwest, including German-speaking Switzerland).

These dialects are very diverse, and the degree of mutual comprehensibility between even geographically quite close dialects can be remarkably low. Not all Swiss Germans, who are all competent in their local dialect, can understand the dialects of the remoter Alpine valleys. Few linguistic criteria, with the possible exception of the verb-second constraint, link all the speech varieties within this continuum exclusively, and only the long-established notion

that these are all, in some way, forms of German provides a connection, as does the use of the common standard, which is important for supraregional communication and as a unifying symbol of ethnic identity. The significance of the latter has become clear again following reunification in 1990. Nevertheless, there is significant variation in the codification of the standard between the various German-speaking countries, and some regional diversity is accepted in the standard even within Germany, particularly at the level of lexis (e.g., northern *Sonnabend* and southern *Samstag* 'Saturday').

Remarkable, too, is the sociolinguistic diversity of the German speech area in the variety of the relationships between standard German, the dialects, and other languages. German-speaking Switzerland is a classic instance of diglossia, although the nature of this diglossia is changing rapidly. South Tyrol and eastern Belgium exhibit relatively stable – and nowadays institutionalized – bilingualism, whereas in Alsace-Lorraine the centuries-old French–German bilingualism is breaking down with the rapid decline of the local dialects and the decoupling of the link between them and standard German. Within Germany and Austria the relationship between *Hochdeutsch* and the dialects varies markedly over the whole area, with the relative prestige and use of dialect increasing the further south one travels. A common pattern in central and southern Germany is the existence of a continuum of variants between near-dialect and near-standard, with speakers employing two focused varieties along this continuum that they perceive as (and label) *Hochdeutsch* and dialect. These are then used in accordance with the perceived formality of a given speech situation.

German Lexicography

U Kramer, Berlin-Brandenburg Academy of Sciences, Berlin, Germany

© 2006 Elsevier Ltd. All rights reserved.

From the Beginnings up to the 17th Century

The beginnings of German lexicography can be found in medieval glossaries. Latin-Old High German glossaries such as *Abrogans* (ca. 765, Freising), named for its first entry, and specialist glossaries such as the widely copied *Summarium Heinrici* from the 11th century, were used in language teaching and education and to help travelers with communication. Numerous similar vocabulary collections appeared up to the 14th century, arranged alphabetically or thematically (for an overview, cf. Grubmüller (1990)). In one of these, the *Engelhus* glossary (ca. 1400), a German headword is explained in German for the first time: *Segel* ('sail'). *Vocabularius ex quo* (1410) shaped the 15th century lexicographical landscape. This major thesaurus of Early New German is unrivalled: wherever German was written, copies could be found, in more than 270 manuscripts. It was first printed in 1467, and by 1505 46 reprints had appeared.

The first printed German-Latin glossary was the *Teuthonista vulgariter dicendo Duytschlender* (Gherard van der Schueren, 1477), which was based on an older German-Latin word list, *Vocabularius theutonicus* (ca. 1400). In the Humanist period, the German language competed successfully with Latin. Humanist onomastica – e.g., Hadrianus Junius: *Nomenclator omnium rerum* (Antwerp, 1567, reprinted 1976), Theophilus Golius: *Onomasticon*

that these are all, in some way, forms of German provides a connection, as does the use of the common standard, which is important for supraregional communication and as a unifying symbol of ethnic identity. The significance of the latter has become clear again following reunification in 1990. Nevertheless, there is significant variation in the codification of the standard between the various German-speaking countries, and some regional diversity is accepted in the standard even within Germany, particularly at the level of lexis (e.g., northern *Sonnabend* and southern *Samstag* 'Saturday').

Remarkable, too, is the sociolinguistic diversity of the German speech area in the variety of the relationships between standard German, the dialects, and other languages. German-speaking Switzerland is a classic instance of diglossia, although the nature of this diglossia is changing rapidly. South Tyrol and eastern Belgium exhibit relatively stable – and nowadays institutionalized – bilingualism, whereas in Alsace-Lorraine the centuries-old French–German bilingualism is breaking down with the rapid decline of the local dialects and the decoupling of the link between them and standard German. Within Germany and Austria the relationship between *Hochdeutsch* and the dialects varies markedly over the whole area, with the relative prestige and use of dialect increasing the further south one travels. A common pattern in central and southern Germany is the existence of a continuum of variants between near-dialect and near-standard, with speakers employing two focused varieties along this continuum that they perceive as (and label) *Hochdeutsch* and dialect. These are then used in accordance with the perceived formality of a given speech situation.

German Lexicography

From the Beginnings up to the 17th Century

The beginnings of German lexicography can be found in medieval glossaries. Latin-Old High German glossaries such as *Abrogans* (ca. 765, Freising), named for its first entry, and specialist glossaries such as the widely copied *Summarium Heinrici* from the 11th century, were used in language teaching and education and to help travelers with communication. Numerous similar vocabulary collections appeared up to the 14th century, arranged alphabetically or thematically (for an overview, cf. Grubmüller (1990)). In one of these, the *Engelhus* glossary (ca. 1400), a German headword is explained in German for the first time: *Segel* ('sail'). *Vocabularius ex quo* (1410) shaped the 15th century lexicographical landscape. This major thesaurus of Early New German is unrivalled: wherever German was written, copies could be found, in more than 270 manuscripts. It was first printed in 1467, and by 1505 46 reprints had appeared.

The first printed German-Latin glossary was the *Teuthonista vulgariter dicendo Duytschlender* (Gherard van der Schueren, 1477), which was based on an older German-Latin word list, *Vocabularius theutonicus* (ca. 1400). In the Humanist period, the German language competed successfully with Latin. Humanist onomastica – e.g., Hadrianus Junius: *Nomenclator omnium rerum* (Antwerp, 1567, reprinted 1976), Theophilus Golius: *Onomasticon*

latinogermanicum (Strassburg, 1597, reprinted 1972), and Nathan Chytreaus: *Nomenclator Latinosaxonicus* (Rostock, 1582, reprinted 1974) – are important milestones in the lexicography of German. The most important alphabetical dictionaries in the transition to humanistic lexicography were Petrus Dasypodius' *Dictionarium latinogermanicum Et vice versa Germanicolatinum* (Strassburg, 1535–1536, reprinted 1974) and *Die Teütsch spraach: Dictionarium Germanicolatinum novum* by Josua Maaler [Pictorius] (Zurich, 1561, reprinted 1971).

The German Dictionary Scene between the 17th and 20th Centuries

The 17th Century

The 17th century can be seen both as a critical and an innovative phase in the history of German lexicography: discussions which continue right down to the present day began in this period concerning the lexicographical codification of German. The roots of a flourishing dictionary scene can be traced to this period.

In 1616, in Augsburg, the first volume (A–G) of Georg Henisch's dictionary *Teütsche Sprach vnd Weissheit: Thesaurus lingvae et sapientiae Germanicae* (reprinted 1973) was published. Henisch was the first German lexicographer to base his dictionary on citations, which he collected himself, and to provide sources. He listed the (High) German vocabulary of his period, including many idiomatic phrases and proverbs, mostly without Latin definitions. The dictionary, which did not develop beyond a fragment, followed the principle of lexical roots, and was motivated by cultural patriotism. It was intended to illustrate the dignity, utility, and richness of the German language. This aim made Henisch a precursor of the lexicographical debates that took place in the 17th century. These debates were conducted under the auspices of learned societies, of which the most influential was the *Fruchtbringende Gesellschaft* ('*Fructifying Society*'), which linked support for a comprehensive dictionary to the question of the status of the German language. They called for a collection of lexical roots that would illustrate the wealth of the German language and support its claim to a status equal to that of the classical languages. They also called for a thorough compilation of German vocabulary, and, given the increasing variety in linguistic standards, they wanted to codify the language, using exemplary authors. However, these discussions did not result in the creation of such a dictionary. The list of approximately 5000 lexical roots provided by Justus Georg Schottel in his *Ausführliche Arbeit Von der Teutschen HaubtSprache* (Braunschweig, 1663, reprinted 1967) can only be seen as a 'framework' for a dictionary. Kaspar Stieler's *Der Teutschen Sprache Stammbaum und Fortwachs oder Teutscher Sprachschatz* (Nürnberg, 1691, reprinted 1968) came closest to fulfilling the visions of the 'Fructifying Society.' Stieler listed about 400 to 600 lexical roots, which he explained in Latin. This dictionary is extensive in comparison with its predecessors, containing about 65 000 words. Stieler codified the contemporary everyday vocabulary, but also included poetic expressions, as well as colloquial and popular expressions.

The 18th Century

Attempts to establish a German dictionary were finally realized by Matthias Kramer with *Das herrlich Grosse Teutsch-Italiänische Dictionarium oder Wort-und Red-Arten-Schatz* (Nürnberg, 2nd edn., 1700/1701, reprinted 1982). This was a bilingual dictionary for foreign language teaching and was oriented strictly toward contemporary language usage. This practical orientation was accompanied by a high esteem for the German language. Kramer's *Dictionarium* is the most thorough representative of late 17th century German lexicography. Christoph Ernst Steinbach's bilingual *Vollständiges Deutsches Wörter-Buch* (Breslau, 1734, reprinted 1973) is also part of the tradition of dictionaries of lexical roots. It contains extensive citations, and, for the first time, a system of diacritical labels, which indicate, for example, regionalisms or obsolete words.

At the beginning of the 18th century, the so-called second lexicographical planning discussion took place, mainly at the *Societät der Wissenschaften* in Berlin, with contributions from scholars such as Bödiker, Leibniz, Jablonski, and Frisch. This focused on plans for a comprehensive monolingual dictionary dealing with the whole language system, which Leibniz (1697) sketched in *Unvorgreiffliche Gedancken betreffend die Ausübung und Verbesserung der Teutschen Sprache*. This conceptualization of a dictionary was refined by Johann Leonhard Frisch and realized in his *Teutsch-Lateinisches Wörter-Buch* (Berlin, 1741, reprinted 1977). Frisch's dictionary is more comprehensive than its predecessors, containing about 60 000 lemmata, for which examples and citations were provided. The articles contain semantic, grammatical, etymological, sociolinguistic, and phraseological information. Alongside Latin glosses, German is used as the language for definitions. Dictionary entries composed entirely in German can be found alongside 'bilingual' entries. This lexicographical practice makes the *Teutsch-Lateinisches Wörter-Buch* a link

between translation and comprehensive dictionaries. The work's conception, orientated toward a descriptive compilation of the entire language, and its inventory of words from trade and special languages taken from 15th to 17th century sources, make it an important precursor of later general monolingual dictionaries and a reliable reference work. Even today it is valued as a source for Early New High German.

Johann Christoph Adelung compiled the first comprehensive general monolingual dictionary of the German language, *Versuch eines vollständigen Grammatisch-kritischen Wörterbuchs der Hochdeutschen Mundart mit beständiger Vergleichung der übrigen Mundarten, besonders aber der oberdeutschen* (5 vols., Leipzig, 1774–1786). He began refining it directly after publication, and an improved edition of the work appeared as *Grammatisch-kritisches Wörterbuch der Hochdeutschen Mundart mit beständiger Vergleichung der übrigen Mundarten, besonders aber der oberdeutschen* (4 vols., Leipzig, 1793–1801, reprinted 1970, CD-ROM, 2000; Adelung, 1811). Adelung's decision to base his dictionary on the regional dialect of Upper Saxony and especially the usage of the Meissen 'upper classes' was criticized. However, a glance at the dictionary illustrates that there is no absolute regional limitation. The dictionary is conceptualized semasiologically. The more than 55 000 entries are ordered strictly alphabetically – a novelty in German lexicography. The vocabulary is described from a synchronic perspective. The articles contain information about grammar, orthography, pronunciation, inflectional morphology, word construction, semantics, etymology, and paradigmatics, along with examples and literary citations. Adelung tried in particular to describe words comprehensively: he regarded it as his duty "to match the terms and definitions of every word as closely as possible." For this, he used exclusively German paraphrases. The most outstanding aspect of Adelung's dictionary is the thorough explanation of the meanings of words. Pragmatics, explaining how a word can be used appropriately, are also stated in great detail and variety. These include a wealth of explanatory notes about register and a five-level system of register for evaluating the 'dignity' of words and phrases.

The *Grammatisch-kritisches Wörterbuch* was highly valued for its user-friendliness and its practical usability. It can be seen as a milestone in German lexicography, and, through its widespread distribution and documented usage, it contributed significantly to the establishment and expansion of the German standard language.

The *Wörterbuch der Deutschen Sprache* (5 vols., Braunschweig, 1807–11, reprinted 1969) by Joachim Heinrich Campe was published as a critical response to Adelung, avoiding his focus on the Meissen dialect and concentrating on the literary language of the period. Competitive and ambitious, Campe also aimed to exceed the number of entries in Adelung. He achieved this aim mainly through the inclusion of compounds and derivatives, and, not least, through coining Germanisms, including new words created by Campe himself. Other collections, such as D. W. Soltau's *Beyträge zur Berichtigung des Adelungschen grammatisch-kritischen Wörterbuchs* (1806), were also incorporated, along with numerous additions from contemporary and specialist literature. Campe did not include etymologies, and he employed a space-saving system of 14 abbreviations to denote words that were obsolete, regional, 'low', poetic, or newly created. Puristic considerations led Campe to list foreign words separately in a work entitled *Wörterbuch zur Erklärung und Verdeutschung der unserer Sprache aufgedrungenen fremden Ausdrücke: ein Ergänzungsband zu Adelungs Wörterbuche* (Braunschweig, 1801). Three years later, this was superseded by an improved edition, with the subtitle *Ein Ergänzungsband zu Adelung's und Campe's Wörterbüchern* (1813, reprinted 1969). Campe's dictionary is not particularly innovative: it is based on Adelung's in practically all aspects, and it made considerable use of the *Grammatisch-kritisches Wörterbuch*. Even a superficial comparison indicates that many articles were adopted without alteration or contained only minor modifications.

The 19th Century

In 1852, a chapter in German lexicography opens in which the historical treatment of German vocabulary is a dominant focus, with the publication of the first part of the *Deutsches Wörterbuch* (*DWB*). The *DWB* was planned and begun in the late 1830s by Jacob and Wilhelm Grimm. They saw it as a privately initiated publication of six to seven volumes, which they would work on for approximately 10 years. In the event, the work was completed only after more than 100 years of work, as an academic enterprise, with a total of 32 volumes, plus a volume of sources (Leipzig, 1854–1960/1971; CD-ROM, 2004; DWB). In the *DWB,* the Grimm brothers followed nationalistic pedagogical and political ambitions: it aimed to be a reference work for use in equal measure both by scholars and by the public interested in language, showing the Germans the wealth of their mother tongue, and it aimed to have a positive effect on German unification, which was still awaited at that time. The Grimms conceived the work as a descriptive dictionary. In 1846, Wilhelm Grimm said: "We

want to present the language in the way that it has presented itself over the past three centuries . . . . Our work will . . . contain a natural history of words." Work on the articles themselves began in 1849. Jacob worked on letters *A, B, C, E,* and *F* (up to *Frucht*) until his death (1863). To a large degree, his work determined the style of the dictionary. Shortly before his death (1859), Wilhelm completed letter *D*. Their most important successors, who shaped the *DWB* in their own ways, were Karl Weigand, Rudolf Hildebrand, Moritz Heyne, and Matthias Lexer. From 1880 onward, there were attempts to anchor the *DWB* in an institution. In 1908, the *Preussische Akademie der Wissenschaften* took it over, and the *DWB* gained the status of a national dictionary. In Göttingen, a central collecting office was established for quotations and references, which were then excerpted according to agreed criteria. In 1930, the *DWB* was domiciled in Berlin, with the establishment of an editorial department and, 78 years after the appearance of the first fascicle, the formulation of binding guidelines for the lexicographical task. After World War II, and the division of Germany, work continued in the Academies of Sciences in Berlin (GDR) and Göttingen (FRG) and was completed in 1960.

The *DWB* contains the vocabulary of written New High German, in alphabetical order, from the mid 15th century to the present. It centers on the description and analysis of meanings and different descriptions of how the words can be used. The dictionary documents chronologically the emergence, alteration, and nuancing of word meanings from their first appearance to their most recent documentation, and is substantiated with citations from sources. The etymology, cognate words, and older forms are described, along with their geographical prevalence within the German language area.

The dictionary includes vernacular, colloquial, and also 'lewd' words, along with the word stock from the older German professional jargons of hunters, miners, fishermen, etc. One peculiarity in the recording of words in the *DWB* is the generous recognition of interjections, expressions, and onomatopoeia. There is only a limited inclusion of Low German, foreign words, and proper names (particularly personal names). Despite some gaps, no other German dictionary contains and comments on the development of word usage in German texts from the Middle Ages up to the present as thoroughly as the *DWB*. The long period of development, the absence of guidelines, successive editors who lacked any form of guidance other than their own practice, the alternation between linguistic and lexicographic principles, and not least, Germany's changing political circumstances, make the *DWB* an extraordinarily heterogeneous work. Its total of 67 744 printed columns (with ca. 350 000 headwords) contain clearly differing dictionary styles, with variations ranging from the composition of items and the explanations of meaning to the presentation of the quotations and the selection of sources. However, despite some deficits, the *DWB* is **the** material documentation of the German language, and as a fundamental work of the history of words it is indispensable for linguistic and cultural historical research.

In the 1950s, under the leadership of Theodor Frings, preparation began for the reworking of the *DWB*. This has been in progress since 1957 at the academies in Berlin (*A* to *C*) and Göttingen (*D* to *F*). The first fascicle (*A – Abenteuer*) appeared in 1965, and by 2003, publication had reached the words *aufsuchen* (Berlin) and *flieszen* (Göttingen). The reworking is not a supplement to the first edition, but a completely new dictionary. Like the original Grimm, the new version will also eventually be available online.

At the end of the 19th century, the majority of dictionaries either followed the historical principles of *DWB* or aimed to fill its specific gaps. Some examples worth mentioning are the *Deutsches Rechtswörterbuch* (Weimar, 1896/1897–), which contains the vocabulary of legal texts from the beginning of written records in the 5th century up to the time of Goethe; and the *Deutsches Fremdwörterbuch* (Strassburg, 1913–1983, reworked since 1990), which describes the historical development of loan words.

An extraordinarily successful 19th century work was the one-volume *Deutsches Wörterbuch* by Hermann Paul (Halle, 1897), a conceptual alternative to Grimm. This is a historical dictionary with a focus on sources. The dictionary is in its tenth edition, after being reworked and expanded (Tübingen, 2002; CD-ROM 1992).

The most productive German lexicographer of the 19th century was Daniel Sanders, author of the *Wörterbuch der deutschen Sprache, mit Belegen von Luther bis auf die Gegenwart.* (Leipzig, 1869–1865/1871, 2nd edn., 1876, reprinted 1969). This arose from critical engagement with the Grimms' project, which Sanders considered to be mistaken. His dictionary focuses on the usage of educated German speakers of the 19th century, although it also has a historical dimension. Together with the *Ergänzungs-Wörterbuch,* which appeared in 1871, Sanders is a systematic and reliable source for the standard German used in the second half of the 19th century. Unfortunately, the words are often hard to look up, as Sanders did not order headwords strictly alphabetically, but instead nested compounds and derivates

under their basic word, for example *einschalten* under *schalten*, *empfinden* under *finden,* and the headword *Gebirge* is between *Bir* and *Birgel* under *B*.

The 20th Century

The lexicographical scene in Germany in the first half of the 20th century was largely shaped by the *DWB* and German language studies, with a predominantly historical focus and no major lexicographical innovations. An authoritative monolingual dictionary of contemporary German did not exist. A new benchmark for a monolingual dictionary of the present-day German language was set at the Akademie der Wissenschaften in Berlin (GDR), where work started in 1952 on the *Wörterbuch der deutschen Gegenwartssprache* (*WDG*, ed. by Ruth Klappenbach and Wolfgang Steinitz). This work was published between 1961 and 1977 in 57 parts, in a total of six volumes (followed by several new editions until 1982). Even during its publication, it was recognized (not only in East Germany) as a pioneering development in German lexicography, because of its form, its elegance, and its philological meticulousness. *WDG* is a dictionary whose stock of words was not merely copied from other dictionaries, but was systematically collected from primary sources and verified. Its sources include most of the important contemporary authors in the German-speaking lands up to the 1970s, and numerous older texts by German authors since Lessing and Kant. Thus the dictionary contains primarily the general vocabulary of the 20th century, together with a substantial part of the literary vocabulary of the 18th and 19th centuries, for which the archive of the *DWB* was used. In the preface, the authors describe their aim of collecting the current German language of the educated classes in its oral and written form. The entries were influenced primarily by this focus, although in some cases also by an ideologically determined description of the sociopolitical vocabulary of the time. Seen from the perspective of the 21st century, the proportion of entries noticeably influenced by East German (GDR) political ideology is comparatively slight. The *WDG*'s entries are clearly structured and systematic. The meanings are recorded and explained succinctly. The articles contain grammatical details. However, there is comparatively little etymological information and little guidance on pronunciation. Phraseology is emphasized with illustrative and literary examples. Two innovative aspects are the systematic labeling of register, for example *umg*. (umgangssprachlich: 'colloquial'), *geh*. (gehoben: 'elevated'), *abwertend* ('pejorative'), *verhüllend* ('euphemistic'), etc., and the treatment of compounds, in which the headword is the final component. In addition, neologisms are marked as *Neuwörter* ('new words'), *Neuprägungen* ('new creations'), or *Neubedeutungen* ('new meanings'). The *WDG* recognizes many foreign words, but specialist and vernacular words are given more restricted coverage.

After the *WDG*, in the Federal Republic, two six-volume dictionaries of the German contemporary language were published which do not qualitatively supersede their East German precursor. Günther Drosdowski's *Duden: das grosse Wörterbuch der deutschen Sprache in sechs Bänden* (Mannheim, 1976–1981) differs from the *WDG* in the number of headwords and the corpus of sources and its coverage of specialist vocabulary. The *Brockhaus-Wahrig: deutsches Wörterbuch in sechs Bänden* (Wiesbaden, Stuttgart, 1980–1984) is not based on primary sources, but copied from other dictionaries. In contrast to *WDG* and *Duden,* the *Brockhaus-Wahrig* records proper names, especially first names.

There are three compact dictionaries that are conceptually comparable to the multivolume dictionaries. Gerhard Wahrig's *Deutsches Wörterbuch* (Gütersloh, 1966, 7th edn., 2002; CD-ROM by Wahrig), recently reworked and published by Renate Wahrig-Burfeind, is a lexicographical bestseller. It contains not only the German basic vocabulary, but also numerous technical words from specialist fields and neologisms. This dictionary's greatest strengths lie in the integration of grammar and lexis; there are, however, weaknesses in the explanations of meaning and examples. The *Duden: deutsches Universalwörterbuch* (Mannheim, 1983, 5th edn., 2003; CD-ROM) is established as **the** one-volume standard dictionary for the contemporary German language and an example of continuous dictionary maintenance.

The *Handwörterbuch der deutschen Gegenwartssprache*, produced under the direction of Günther Kempcke (Berlin [GDR] 1984) is based on the *WDG*. The *Handwörterbuch* develops new ground: it is the only general monolingual dictionary of German contemporary standard speech that deals appropriately with idioms.

The Duden publishing house issued *Duden: das grosse Wörterbuch der deutschen Sprache in zehn Bänden* (*GWDS*) in 1999. This is currently the most comprehensive documentation of the German language and it is based on authentic sources. In comparison to its predecessors (Mannheim, 6 vols., 1976–1981; 8 vols., 1993–1995), it is based on a significantly expanded corpus, including publications up to and including 1999. It also records numerous words from the historical vocabulary of the 18th and 19th centuries. *GWDS* uses the new German spelling rules (1998) throughout, in the citations and

examples as well as in the definitions. Another noteworthy innovation is the abandonment of the customary nested ordering of headwords. Each entry in *GWDS* has headword status.

The dissolution of the nests has some negative consequences: when searching for elements of extensive word families, with numerous compounds and derivatives, the user needs some persistence. Compounds with *Ehe-*, for example, extend over eight columns. Furthermore, details relevant to the headword are lost, regarding pronunciation or register labels which formerly applied to the entire nest. These no longer appear, as would be required, near words with separate lemmata. In such cases, a meticulous user, or one insecure about words, would first have to look up the 'main' headword for orientation. *GWDS* reflects current developments in the German language and German society and includes new words such as *Altersteilzeit* (part-time work for a retired person), *Bleiberecht* (right to remain a resident in a country), *Euroland* (country that uses or all countries that collectively use the Euro as its currency), *Suchmaschine* ('search engine', e.g., Google), *Reformstau* (reform backlog), alongside the many Anglicisms, for example: *Late-Night-Show, Offroader, Touchscreen, User.*

German Period Dictionaries

The publication of period dictionaries of the German language started in the late 18th century and reflects the tremendous advances in historical linguistic scholarship over two centuries. The most important German period dictionaries were reworked or reprinted or can be accessed on-line. For Old High German, these include: *Althochdeutsches Wörterbuch* (Berlin, 1968 –, ed. Elisabeth Karg-Gasterstädt and Theodor Frings, continued after vol. 2 by Rudolf Grosse, and since 2001 by Gotthard Lerchner), *Althochdeutsches Wörterbuch*, 2 vols (Berlin/New York, 1993, ed. Jochen Splett), *Althochdeutsches Glossenwörterbuch* (Heidelberg, 1971–1984, ed. Taylor Stark and J. C. Wells), and *Althochdeutsches Wörterbuch* (Tübingen, 5th edn., 1995, ed. Rudolf Schützeichel).

For Middle High German, the main reference work is *Mittelhochdeutsches Wörterbuch*, 5 vols (ed. Georg F. Benecke, Wilhelm Müller, and Friedrich Zarncke, Leipzig 1854–1866; reprinted Stuttgart, 1990; MWV). This is accompanied by a supplement and alphabetical index: *Mittelhochdeutsches Handwörterbuch*, 3 vols (Leipzig, 1872–1878, ed. Matthias Lexer; reprinted Stuttgart, 1992, MWV). An extraordinarily successful compact dictionary is the *Mittelhochdeutsches Taschenwörterbuch* (ed. Matthias Lexer, with supplements by Ulrich Pretzel, 38th edn., Stuttgart, 1992). Eberhard Nellmann provides an annotated index to Benecke, Müller, Zarncke, and Lexer: *Quellenverzeichnis zu den mittelhochdeutschen Wörterbüchern* (Stuttgart/Leipzig, 1997, MWV). Also worthy of mention are Kurt Gärtner *et al.*, *Findebuch zum mittelhochdeutschen Wortschatz* (Stuttgart, 1992, MWV), Erwin Koller, Werner Wegstein, and Norbert R. Wolf, *Neuhochdeutscher Index zum mittelhochdeutschen Wortschatz* (Stuttgart, 1990), *Wörterbuch der mittelhochdeutschen Urkundensprache auf der Grundlage des Corpus der altdeutschen Originalurkunden bis zum Jahr 1300* (Sibylle Ohly and Peter Schmitt, Berlin, 1994 –), and *Kleines Mittelhochdeutsches Wörterbuch* (Beate Hennig, Tübingen, 2nd edn., 1998).

The gap between dictionaries of Middle High German and the *DWB*, which starts with the language of the mid 15th century, have, since 1989, been addressed in the *Frühneuhochdeutsches Wörterbuch* (Berlin/New York, 1989 –), published by Ulrich Goebel and Oskar Reichmann. Other reference sources for Early New High German are *Kleines frühneuhochdeutsches Wörterbuch* (Christa Baufeld, Tübingen, 1996) and *Frühneuhochdeutsches Glossar* (ed. Alfred Götze, 6th edn., Berlin, 1960).

Historical dictionaries also include etymological dictionaries. Among these, the best-known are Friedrich Kluge's *Etymologisches Wörterbuch der deutschen Sprache* (Berlin, 1883, 24th edn., 2002; CD-ROM), *Duden: das Herkunftswörterbuch – Etymologie der deutschen Sprache* (Mannheim 1963, 3rd edn., 2001), and the three-volume *Etymologisches Wörterbuch des Deutschen* (Berlin, 1989, 2nd edn., 1995) published by Wolfgang Pfeifer.

Synonym Dictionaries, Spelling Dictionaries, and Other Reference Works

Toward the end of the 19th century, the first dictionaries of synonyms appeared, initially classified by ontological aspects. Up until then, only some collections of discriminating synonymy were produced (e.g., Johann August Eberhard: *Versuch einer allgemeinen deutschen Synonymik*. Halle, Leipzig, 1795–1802). Then, adopting the model of Peter Mark Roget's *Thesaurus of English Words and Phrases* (1852), Daniel Sanders published *Deutscher Sprachschatz* (Hamburg, 1873–77, reprinted 1985). The *Deutsche Wortschatz* by Anton Schlessing (Stuttgart, 1881) was reworked numerous times until 1993 by Hugo Wehrle and Hans Eggers. One of the best-known onomasiological dictionaries is *Der deutsche Wortschatz*

nach Sachgruppen by Franz Dornseiff (Berlin/Leipzig, 1934, 8th edn., 2004; CD-ROM). The most recent edition, fully reworked by Uwe Quasthoff, includes approximately 90 000 entries, which have partly been updated by corpus research.

Some of the most frequently used dictionaries in German are spelling dictionaries. Since Konrad Duden published his *Vollständiges orthographisches Wörterbuch der deutschen Sprache* (Leipzig) in 1880, these dictionaries have served the orthographic standardization of German. *Duden*, issued in different versions between 1945 and 1989 in East and West Germany, was unrivalled as an authority for more than a century. The introduction of reforms to German orthography, beginning in 1998 and to be completed in 2005, led to a flood of new spelling dictionaries, including *Die deutsche Rechtschreibung* by G. Wahrig (Gütersloh, 2002). *Duden* defended its leading position, and in 2004 its 23rd edition was published. It is no longer purely a spelling dictionary, but a comprehensive, versatile dictionary. In addition to orthographic information, the articles contain semantic, grammatical, and etymological comments, and examples of usage.

Alongside the most successful spelling dictionary, the Duden publishing house publishes a large family of practical language reference works, for example a dictionary of synonyms (*Das Synonymwörterbuch,* 3rd edn., 2004), a syntagmatic dictionary (*Das Stilwörterbuch,* 8th edn., 2001), a pictorial dictionary (*Das Bildwörterbuch*, 5th edn., 2000), a pronunciation dictionary (*Das Aussprachewörterbuch,* 4th edn., 2000), a dictionary of idioms (*Redewendungen*, 2nd edn., 2002), a dictionary of 'foreign' words (*Das Fremdwörterbuch*, 7th edn., 2001), and others.

German Lexicography in the 21st Century

Several major lexicographical projects launched in the 20th century are still in progress, for example the *Goethe-Wörterbuch* of the Berlin and Göttingen academies. This has been issued in parts since 1978. With more than 90 000 lemmata it is the most comprehensive thesaurus for any author in the German-speaking lands.

Various older dictionaries are being reworked and reissued, for example the *Paul* and the *Langenscheidt Grosswörterbuch Deutsch als Fremdsprache* (Berlin, 2003, CD-ROM 2004). Several aspects make this learner's dictionary recommendable, including its up-to-date word list, the extensive coverage of compounds, appropriate handling of idioms, and the presentation of word usage in context.

Other lexicographical innovations include the *Variantenwörterbuch des Deutschen: die Standardsprache in Österreich, der Schweiz und Deutschland sowie in Liechtenstein, Luxemburg, Ostbelgien und Südtirol* (ed. Ulrich Ammon *et al.*, Berlin, 2004) and a dictionary of neologisms, *Neuer Wortschatz – Neologismen der 90er Jahre im Deutschen* (ed. Dieter Herberg *et al.*, Berlin, 2004). Despite the frequent reissue of the *Kleines Lexikon untergegangener Wörter* (Munich, 1971, 15th edn., 2004) by Nabil Osman, a full scholarly dictionary of archaisms remains to be undertaken.

The changeover to digital lexicography which began in the last decade of the 20th century has continued with new lexicographical information systems. These include, for example, the corpus-based information system *elexiko* of the Mannheim Institut für Deutsche Sprache (Elexiko). This database focuses on the written German standard language since about 1945 as it is used in national and regional newspapers. The *Digitales Wörterbuch der deutschen Sprache des 20. Jahrhunderts (DWDS)* of the Berlin Brandenburg Academy of Sciences has created a 'core corpus' of about 100 million text words, with a well-balanced selection of text types, covering the entire 20th century, publicly available for on-line research (DWDS). Behind this lies a much larger corpus, approximately 1 billion text words, some texts of which are subject to copyright restrictions and not publicly available, being used only for lexicographic research. One particular aspect of the *DWDS* is the building of links between the corpus database and the *WDG*, together with a word information system based on this. The *DWDS* also permits statistical inquiries concerning word and collocation frequencies, and research into bibliographical data. The *Wörterbuchportal* of the academies is a promising development. In addition to displaying the German academies' achievements in historical lexicography, it also presents a collection of links to academic dictionary projects and functions as a search tool for digitized scholarly dictionaries (Wörterbuchportal).

Germanic Languages

M Durrell, University of Manchester, Manchester, UK

© 2006 Elsevier Ltd. All rights reserved.

The Germanic languages include Dutch, English, German, and the Scandinavian languages. From their original home in northwest Europe, they have become one of the most widely distributed language groups, being spoken on five continents by at least 550 million native speakers. By far the largest proportion of these (over 70%) are first-language speakers of English.

The Germanic Language Group

The Germanic languages constitute a distinct branch of the Indo-European language family. Since the 19th century it has been conventional to distinguish three major subgroupings within Germanic:

- *West Germanic*, including English (with many varieties and descendants, notably Scots and numerous creoles and pidgins), German (with several relatively distinct varieties and offshoots, including Low German, Luxembourgish (Luxembourgeois), Pennsylvanian (Pennsylvanish), and Yiddish), Dutch (with its descendent Afrikaans), and Frisian (with three mutually unintelligible varieties: Western Frisian, East Frisian, and Northern Frisian).
- *North Germanic* in Scandinavia, comprising a western group that includes Icelandic, the closely related Faroese (together with the now-extinct dialects of other early Norse settlements), and Norwegian (with its two codified standard varieties Bokmål and Nynorsk); and an eastern group including Danish and Swedish. The mainland Scandinavian languages are mutually comprehensible to a significant degree.
- *East Germanic*, which is usually taken to include Gothic, Burgundian, and Vandalic and possibly some further languages such as Gepidic and Rugian. However, all these languages are now extinct and the evidence that they actually constituted a discrete group with common linguistic features is slight. Little is known of them except for Gothic, for which part of a 4th century Bible translation has survived. This is the earliest continuous text in any Germanic language.

The Origins and Early History of the Germanic Languages

The genetic relationship among the Germanic languages is clear from many lexical cognates (cf. English *house*, *red*, *I gave*; Dutch *huis*, *rood*, *ik gaf*; Norwegian (Bokmål) *hus*, *rød*, *jeg gav*; Gothic *hus*, *rauþs*, *ik gaf*), and this relationship was already recognized by scholars in the 16th century. The ancestor language, usually called Proto-Germanic, was probably spoken around the North Sea and the Baltic in the first millennium B.C. Within the Indo-European family, Proto-Germanic appears to be most closely related to Italic (and possibly Illyrian and Venetic), although there are significant affinities, particularly in morphology and lexis, with Baltic (and possibly Slavonic). Nevertheless, almost one-third of the core vocabulary that can be reconstructed for Proto-Germanic lacks any Indo-European cognates, notably words relating to the sea and seafaring, such as English *boat*, *sea*, and *ship* and the words for the points of the compass. Early lexical loans from Celtic (e.g., the ancestor of German *Reich* 'kingdom') testify to the earliest contacts of the Germanic peoples, as do a significant number of lexical loans from Proto-Germanic into Finnish (e.g., Finn. *kuningas* 'king'). These are particularly interesting because they still retain features and forms that have disappeared in even the earliest attested Germanic dialects and can only be reconstructed for the common ancestor.

The first longer account of the Germanic peoples is by the Roman historian Tacitus in his *Germania* of 98 A.D., by which time some Germanic tribes had moved southward from the shores of the Baltic into central Europe and come into contact and conflict with the Roman Empire as it expanded northward. The first linguistic records, from the 3rd century A.D. onward, are carved inscriptions using the Runic alphabet or fuþark (so-called after the first six letters of the alphabet). The origins of this writing system are obscure, although it appears to be based on an early Etruscan or north Italian alphabet, and it is not used for longer texts. Runic inscriptions have been found in many parts of northern and eastern Europe, and their language is remarkably uniform, irrespective of their provenance. It is sometimes erroneously referred to as Primitive Norse or Proto-Norse, but there is no evidence that its form is specifically North Germanic.

The relationship of the early Germanic dialects to one another is a matter of controversy. The assumption of an early three-way split into East, North, and West Germanic is no longer accepted, but no consensus has replaced it. A majority view at present is that the East Germanic group, specifically Gothic, split from the common ancestor first, leaving a North-West Germanic group that has been identified with the language of the early Runic inscriptions. This divided into the North Germanic and West Germanic

groups. North Germanic or Old Norse is the common ancestor of the modern Scandinavian languages; it is very close, if not identical, to the attested Old Icelandic of the sagas and the *Edda*.

West Germanic, on the other hand, as the ancestor of modern Dutch, English, Frisian, and German, appears to have been a much more diffuse grouping with few common features. It is probably best considered as a dialect continuum, although the relationship of the dialects within it and the development from the earliest stages into the modern languages and dialect groups are not clear in every respect. Within West Germanic, three main complexes of dialects have been identified: North Sea Germanic (sometimes referred to as *Ingwaeonic*, following the terminology of Tacitus), Weser-Rhine Germanic (or *Istwaeonic*), and Elbe Germanic (or *Erminonic*). Modern English and Frisian have their origin in dialects of the North Sea Germanic group. Early forms of Dutch (called Old Low Franconian) are poorly attested, but modern Dutch, like Low German (and its earliest form Old Saxon) seems to combine features of North Sea and Weser-Rhine Germanic. The principal characteristic of (High) German within West Germanic results from the Second Sound Shift, whereby inherited voiceless plosives developed into affricates or fricatives (cf. English *pepper*, *water*, *token* with German *Pfeffer*, *Wasser*, *Zeichen*). This change is commonly assumed to have occurred between the 5th and 7th centuries A.D. in the Elbe Germanic dialects and some of the more southerly Weser-Rhine Germanic dialects, which thereby combined to form the basis for modern German.

This view of the development of the Germanic languages has recently been challenged by Vennemann (1984), who put forward a new account of the development of the Germanic languages from the earliest times. In his view, the division reflected in the Second Sound Shift goes back to an underlying division within Proto-Germanic into Low and High Germanic, with (High) German thus separated from the other dialects at a very early stage. These views have not been widely accepted, but they succeeded in reopening a still ongoing debate on some of the more intractable problems in the early history of the Germanic languages.

Table 1 First Sound Shift (Grimm's Law)

Indo-European	*Latin*	*Gothic*	*English*
*trejes	trēs	þreis	three
*dekm̥	decem	taihun	ten
*dhur-	forēs	daur	door

The Germanic peoples played a significant part in the great migrations that followed the fall of the Roman Empire, and Germanic tribes spread over wide areas of Europe, although they were subsequently assimilated into the local populations. This has left substantial traces in the form of lexical loans in many languages of southern Europe (e.g., French *garder*, Italian *guardare*, and Spanish/Portuguese *guardar* from the Germanic root **wardōn* 'watch'). The lexical influence of Frankish, a West Germanic language, on early French, is of particular importance, and some 700 such loans can be dated from the 3rd to the 8th centuries.<roto-Germanic had only two tenses (past and nonpast), although this has been extended by periphrastic forms in all the descendent languages. Proto-Germanic also retained only one nonindicative mood, combining the functions of the I-E subjunctive and optative, although this is vestigial in all the modern languages except German and Icelandic. Characteristic of all the Germanic languages, however, is an extensive set of auxiliary verbs expressing modality (called modal auxiliaries), represented in English by *can*, *may*, *must*, *shall*, *will*, and so on. These verbs are typically highly irregular and syntactically deviant. Traces of the I-E synthetic passive are found only in Gothic (and there only in the present tense), and the passive is expressed through auxiliary constructions in all the modern languages. However, the Scandinavian languages have also developed a new inflectional passive deriving from the grammaticalization of the reflexive pronoun.

In the noun, the three I-E genders were retained, but these have been reduced to two (common vs. neuter) in standard Dutch and much of Scandinavian. English, Afrikaans, and some dialects of Danish, however, have lost all gender distinctions. Germanic kept four of the I-E cases, nominative, accusative, genitive, and dative (although early West Germanic has traces of an instrumental). These have been subject to further attrition in almost all the modern languages, with only Icelandic (with Faroese) and standard German retaining four cases. The other languages, in particular, no longer mark any verb arguments through inflections, except in the pronouns.

The original word order of Germanic is a matter of controversy, although majority opinion favors the assumption of underlying SOV. The sentence structure in all the extant older texts, however,

Table 2 Verner's Law

Indo-European	*Latin*	*Gothic*	*English*
*pəté̍r	pater	fadar	father

is very variable, and it has been viewed as flat, or nonconfigurational. The modern languages have moved to more fixed word order, with most of them exhibiting a characteristic verb-second (V2) structure in declarative main clauses, with the verb as the second constituent and the initial position typically being occupied by the sentence topic, which may not be the subject. English is the exception here, having moved to SVO in all clause types in the early modern period. The other West Germanic languages, with the exception of Yiddish, have a characteristic SOV structure in subordinate clauses.

This article is reproduced from the previous edition, volume 3, p. 1429, © 1994, Elsevier Ltd.

In the Federal Republic of Germany (FRG), numerous varieties of German are spoken, as well as several long-established minority languages, and some languages that have been introduced since the late 1950s.

Standard German is the official language, used in administration, education, and the mass media. It is not rigidly homogeneous: a few ordinary words such as 'butcher' or 'cream' differ according to region, and there are one or two minor grammatical differences, while accents vary strikingly in line with those of local nonstandard German dialects. Such regional differences are not stigmatized. It is reckoned that upwards of 77 600 000 people in the FRG can use Standard German.

Regional nonstandard dialects are in use relatively far up the social scale. These differ greatly, those relatively far apart geographically being mutually unintelligible. They fall into two general groups: Low German (Plautdietsch) in the north and High German in the south, with a transition zone of Central German dialects. Even within Plautdeutsch, there are 20 or more mutually unintelligible varieties. The more extreme rural varieties are perceptibly approximating to the urban forms of their area. Varying according to the situation of speaking, some dialect speakers may use anything from extreme dialect to a locally accented, more or less standard German. The percentage of those who claim to be able to speak a dialect varies from 71% in Bavaria to 46% in northern Germany.

The political division that existed from 1948 to 1990 between the former FRG and the former German Democratic Republic (GDR) was reflected in the forms of the standard language. Political institutions or attitudes peculiar to one or other state had names not used in the other state, while certain 'political' words had different meanings, for example, *Aktivist* 'activist' (FRG) versus 'one who overfulfills his "plan"' (GDR). However, some nonpolitical terms were also different: *Schallplattenunterhalter* (GDR), *Diskjockey* (FRG) 'disk-jockey'; *Plaste* (GDR), *Plastik* (FRG) 'plastic'. While it is reasonable to suppose

is very variable, and it has been viewed as flat, or nonconfigurational. This article is reproduced from the previous edition, volume 3, p. 1429, © 1994, Elsevier Ltd.

In the Federal Republic of Germany (FRG), numerous varieties of German are spoken, as well as several long-established minority languages, and some languages that have been introduced since the late 1950s.

Standard German is the official language, used in administration, education, and the mass media. It is not rigidly homogeneous: a few ordinary words such as 'butcher' or 'cream' differ according to region, and there are one or two minor grammatical differences, while accents vary strikingly in line with those of local nonstandard German dialects. Such regional differences are not stigmatized. It is reckoned that upwards of 77 600 000 people in the FRG can use Standard German.

Regional nonstandard dialects are in use relatively far up the social scale. These differ greatly, those relatively far apart geographically being mutually unintelligible. They fall into two general groups: Low German (Plautdietsch) in the north and High German in the south, with a transition zone of Central German dialects. Even within Plautdeutsch, there are 20 or more mutually unintelligible varieties. The more extreme rural varieties are perceptibly approximating to the urban forms of their area. Varying according to the situation of speaking, some dialect speakers may use anything from extreme dialect to a locally accented, more or less standard German. The percentage of those who claim to be able to speak a dialect varies from 71% in Bavaria to 46% in northern Germany.

The political division that existed from 1948 to 1990 between the former FRG and the former German Democratic Republic (GDR) was reflected in the forms of the standard language. Political institutions or attitudes peculiar to one or other state had names not used in the other state, while certain 'political' words had different meanings, for example, *Aktivist* 'activist' (FRG) versus 'one who overfulfills his "plan"' (GDR). However, some nonpolitical terms were also different: *Schallplattenunterhalter* (GDR), *Diskjockey* (FRG) 'disk-jockey'; *Plaste* (GDR), *Plastik* (FRG) 'plastic'. While it is reasonable to suppose

that regional differences in the meanings of political terms will disappear, there is no reason to think that nonpolitical vocabulary will become homogeneous.

Long-established minority languages are East Frisian (11 000 speakers) in three areas of northern Germany, North Frisian (10 000) in Schleswig–Holstein and its off-shore islands, Danish (50 000) in south Schleswig, and Sorbian (80 000 or more) in Upper Saxony and southern east Germany. The Frisian varieties appear to be dying out. In spite of the existence of Danish-speaking schools, the prospects for Danish do not look good. During the existence of the GDR, Sorbian was encouraged and its use was authorized in local government and schools. However, all speakers are bilingual in German, there are two distinct clusters of dialects, and its future is uncertain.

In the east of Germany, there are groups of speakers of Polish (100 000) and Latvian (8000), and in the west there may be upwards of 40 000 speakers of varieties of Romani.

After the late 1950s, an increasing number of 'guest workers' speaking languages from outside northern Europe settled in FRG urban areas, in some cases temporarily, in others more permanently. These included speakers of, among others, Arabic, Greek, Serbo-Croat, Spanish, and Turkish. Because of changing economic circumstances, many of these workers were encouraged to return home from the early 1980s onward. By the mid-1980s, the largest groups remaining were speakers of Arabic (94 000), Hindi (24 500), Kurdish (300 000), and Turkish (1 500 000). Of these, many second-generation speakers, educated in the FRG, are bilingual in German. How many from these groups will continue to live in the FRG remains unclear.

The principal foreign language taught is English, as was the case in the former FRG before reunification; previously, Russian was the principal foreign language taught in the former GDR.

Geschwind, Norman (1926–1984)

J-M Fortis, CNRS and University of Paris 7, France

© 2006 Elsevier Ltd. All rights reserved.

Norman Geschwind was born on January 8, 1926 in New York City. From an early date, Geschwind's intellectual interest was directed toward the study of human behavior, and his initial goal was to become a psychiatrist. He would have certainly shrugged off any mention of biology as irrelevant to the topic of human behavior, had he not taken up a course in neuroanatomy with Marcus Singer, who convinced him of the importance of biology for the understanding of behavior.

He graduated from Harvard Medical School in 1951. His postgraduate years were spent in the National Hospital in London. He was then appointed Chief Resident in Neurology at the Boston City Hospital. In 1958, he moved to the Boston Veterans Administration Hospital, where he had his first opportunity to examine aphasic patients with Dr. Quadfasel. Quadfasel was to introduce Geschwind to the classic neurological literature, notably the texts of connectionist aphasiologists such as Wernicke, Dejerine, and Liepmann. From 1969 until his death on November 4, 1984, Geschwind occupied the chair of neurology at the Harvard Medical School.

Geschwind's discovery of connectionist theories, at a time when they were disreputable or ignored, was to shape his vision of aphasia. Thus, he was inclined to think that selective disruption of processing centers and disconnections could account for a number of aphasic disturbances. Among his first studies was a report on a patient who was found to be unable to write or name objects placed in his left hand. Geschwind predicted a disconnection of the right hemisphere from the speech area, which was later confirmed by post-mortem examination. He also rediscovered a variety of anomia restricted to presentation of stimuli in a single modality (or 'isolated naming disturbance'), which he contrasted with the 'classical,' global form of anomia. For the

that regional differences in the meanings of political terms will disappear, there is no reason to think that nonpolitical vocabulary will become homogeneous.

Long-established minority languages are East Frisian (11 000 speakers) in three areas of northern Germany, North Frisian (10 000) in Schleswig–Holstein and its off-shore islands, Danish (50 000) in south Schleswig, and Sorbian (80 000 or more) in Upper Saxony and southern east Germany. The Frisian varieties appear to be dying out. In spite of the existence of Danish-speaking schools, the prospects for Danish do not look good. During the existence of the GDR, Sorbian was encouraged and its use was authorized in local government and schools. However, all speakers are bilingual in German, there are two distinct clusters of dialects, and its future is uncertain.

In the east of Germany, there are groups of speakers of Polish (100 000) and Latvian (8000), and in the west there may be upwards of 40 000 speakers of varieties of Romani.

After the late 1950s, an increasing number of 'guest workers' speaking languages from outside northern Europe settled in FRG urban areas, in some cases temporarily, in others more permanently. These included speakers of, among others, Arabic, Greek, Serbo-Croat, Spanish, and Turkish. Norman Geschwind was born on January 8, 1926 in New York City. From an early date, Geschwind's intellectual interest was directed toward the study of human behavior, and his initial goal was to become a psychiatrist. He would have certainly shrugged off any mention of biology as irrelevant to the topic of human behavior, had he not taken up a course in neuroanatomy with Marcus Singer, who convinced him of the importance of biology for the understanding of behavior.

He graduated from Harvard Medical School in 1951. His postgraduate years were spent in the National Hospital in London. He was then appointed Chief Resident in Neurology at the Boston City Hospital. In 1958, he moved to the Boston Veterans Administration Hospital, where he had his first opportunity to examine aphasic patients with Dr. Quadfasel. Quadfasel was to introduce Geschwind to the classic neurological literature, notably the texts of connectionist aphasiologists such as Wernicke, Dejerine, and Liepmann. From 1969 until his death on November 4, 1984, Geschwind occupied the chair of neurology at the Harvard Medical School.

Geschwind's discovery of connectionist theories, at a time when they were disreputable or ignored, was to shape his vision of aphasia. Thus, he was inclined to think that selective disruption of processing centers and disconnections could account for a number of aphasic disturbances. Among his first studies was a report on a patient who was found to be unable to write or name objects placed in his left hand. Geschwind predicted a disconnection of the right hemisphere from the speech area, which was later confirmed by post-mortem examination. He also rediscovered a variety of anomia restricted to presentation of stimuli in a single modality (or 'isolated naming disturbance'), which he contrasted with the 'classical,' global form of anomia. For the

former syndrome, he again hypothesized disconnection from the speech area. The latter was attributed to a lesion of the left angular gyrus. This zone was claimed to be the locus where perceptual attributes making up the referents of (concrete) words are associated.

Geschwind was also partly responsible for the renewed interest in transcortical aphasias, notably in that form of aphasia involving a disruption of both the motor and the sensory pathways to meaning ('isolation of the speech area'). As a connectionist, he laid much emphasis on 'pure' disturbances, in which a specialized mechanism is impaired, such as alexia without agraphia, or pure word-deafness. In this, he was following again the steps of his predecessors, Dejerine and Liepmann.

Last, it should be mentioned that Geschwind's investigations involved not only aphasic disturbances but also apraxias and agnosias, which he approached in the same connectionist spirit. A synthesis of his ideas can be found in his now classic paper of 1965.

Gesenius, Wilhelm (1785–1842)

A Gianto, Pontifical Biblical Institute, Rome, Italy

© 2006 Elsevier Ltd. All rights reserved.

Gesenius was born at Nordhausen, Germany on February 3, 1786. He studied theology at Helmstedt 1803–1806, and then in 1806 he became a nontenured instructor at the Theological Faculty at Göttingen. In 1809 he took up a job as a teacher at a Gymnasium in Heiligenstadt. The following year he was appointed extraordinary professor of theology at the University of Halle and in 1811 became full professor there, where he stayed until his death on October 23, 1842. Gesenius authored works of lasting value in the area of Semitic philology, especially Classical Hebrew. He has been acclaimed for his efforts in making the study of the Hebrew language and literature a respectable field of investigation and not only a subservient field to theological studies.

In 1830 he was accused, together with his colleague Julius A. L. Wegscheider, of being a 'rationalist' by Ludwig von Gerlach in then influential *Evangelische Kirchenzeitung*. But Gesenius managed to survive without losing his job in the theological Faculty.

His most influential work is the two-volume *Hebräisches-deutsches Handwörterbuch* ... that appeared in 1810–1812. A second, improved, edition in 1815 appeared as *Hebräisches und chaldäisches Handwörterbuch über das Alte Testament*. This edition was several times revised by Gesenius himself and, after his death, by other scholars. From its tenth edition in 1886 onward the word *chaldäisches* is replaced by *aramäisches*. Its 17th edition by Frants Buhl, which appeared in 1915, is the last revision completed to date. The 18th edition started by U. Rüterswörden, R. Meyer, and H. Donner, which is a thorough revision, is not yet finished. Gesenius's standard lexicographic work is the *Thesaurus philologicus criticus linguae Hebraeae et Chaldaeae Veteris Testamenti,* which began in 1829 and was completed only after his death by E. Rödiger in 1858.

Not less influential is his *Hebräische Grammatik,* published for the first time as a pedagogical grammar in 1813. By 1842 it had reached 13 editions. E. Kautzsch reworked the grammar in 1909 and turned it into a reference grammar. A further reworking by G. Bergstrasser in 1918/1929 covered the phonology and the greater part of the morphology.

Gesenius's lexicon and grammar, in their updated editions and various translations, are still valuable as reference works. In the English-speaking world the latest, best-known version of Gesenius's lexicon is based on E. Robinson's English translation of Gesenius's 1833 Latin version *Lexicon Manuale Hebraicum et Chaldaicum in V.T. Libros,* which was edited with constant reference to Gesenius's own *Thesaurus* by F. Brown, S. R. Driver, and C. A. Briggs (hence the familiar 'BDB'), with the title of *Hebrew and English lexicon of the Old Testament* (Oxford 1907; reprinted with corrections 1953).

Gesture and Communication

D McNeill, University of Chicago, Chicago, IL, USA

© 2006 Elsevier Ltd. All rights reserved.

As a field of study, gesture has become energized in recent years. There is now an organization (International Society for Gesture Studies) and a journal (*GESTURE*, founding editors Adam Kendon and Cornelia Müller). In preparing this article, I have aimed to balance the empirical basics of gestures with a theoretical perspective from which to regard gestures and see what insights they bring to an understanding of the nature of language.

The word 'gesture' covers a multiplicity of communicative movements, primarily but not always of the hands and arms. Often, gestures are assumed to comprise a channel distinct from speech, but careful investigation challenges this traditional view. Gestures and language are best thought of as a single system, larger than either language or gesture as traditionally assumed. It will be useful to begin our survey by drawing distinctions among different actions, all of which might be termed 'gesture.'

Kendon's Continuum

Adam Kendon once distinguished gestures of different kinds along a continuum that I named 'Kendon's Continuum,' in his honor (McNeill, 1992). The gestures we are mostly concerned with are the 'gesticulations.' See McNeill (1992) for details.

'Gesticulation' is motion that embodies a meaning relatable to the accompanying speech. Gesticulation is by far the most frequent type of gesture in daily use and it covers many variants and usages. It is made chiefly with the arms and hands but is not restricted to these body parts – the head can take over as a kind of third hand if the anatomical hands are immobilized or otherwise engaged, and the legs and feet too can move in a gesture mode. In a large sample of gestures, Shuichi Nobe found that the stroke phase of the gesticulation is synchronous with the coexpressive speech about 90% of the time (gesture phases are defined below). When strokes are asynchronous, they slightly precede the speech to which they link semantically, usually because of brief hesitations, and the time gap is small. Gesticulations rarely if ever follow their coexpressive speech (Kendon, 1972). There is no basis for the assertion that strokes occur during hesitations. Such a view has attainted urban legend status, but it is based on a misrepresentation of the original study by Brian Butterworth and Geoffrey Beattie (Butterworth and Beattie, 1978). They reported that the rate of gesture occurrence was higher during speech pauses than phonations. However, far more gestures occur during phonation than pauses, so the 90% figure is the result (Nobe also did not replicate their higher gesture rate during pauses, possibly because of different communicative situations: Nobe was looking at narrations, while Butterworth and Beattie had analyzed college tutorials, where gestures during pauses are likely to have had 'turn suppression' functions not prominent in narrations). The expression 'coexpressive speech and gesture' is explained below. Other controversies have revolved around the issue of whether gesticulations are communicative – 'made for the listener' – or beneficial primarily for speech production – 'made for the speaker' (cf. Krauss *et al.*, 2000; Alibali *et al.*, 2000). Gesticulations combine both universal and language-specific features. Speakers of every language studied thus far (and this is a sizable list: in our lab alone, English, Japanese, Mandarin [Mandarin Chinese], Korean, Spanish, French, German [Standard German], Italian, Turkish, Georgian, Russian, American Sign Language, Taiwanese Sign Language, and a few African languages) produce them, and the gesticulations for the same events in a cartoon stimulus show clear similarities across these languages. Yet there are also striking differences which are traceable

to characteristics of the languages the gestures are cooccurring with, in particular whether the language is, in Leonard Talmy's typology (Talmy, 2000), S-type or V-type (see McNeill and Duncan, 2000). Gesture space is oriented in terms of absolute compass direction by speakers of Guugu Yimithirr (Guguyimidjir) (an Aboriginal language with obligatory absolute orientation in its verb morphology) and also by speakers of Tzotzil (a Mayan language that lacks the lexical precision of directional reference as seen in Guugu Yimithirr [Guguyimidjir], but whose mode of living promotes exact spatial orientation, which is then embodied in gestures; see Haviland, 2000).

'Speech-framed gestures' are part of the sentence itself. The term is from Karl-Erik McCullough. Such gestures occupy a slot in a sentence, e.g., 'Sylvester went [gesture of an object flying out laterally],' where the gesture completes the sentence structure. These gestures time differently from gesticulations – they occupy a gap that fills a grammatical slot, rather than synchronizing with speech that is coexpressive.

'Emblems' are conventionalized signs, such as thumbs up or the ring (first finger and thumb tips touching, other fingers extended) for 'OK,' and others less polite. Kendon prefers the term 'quotable gesture,' referring to a potential for a more or less complete verbal translation – 'OK' translating into terms of approbation, for example. Emblems or quotable gestures are culturally specific, have standard forms and significances, and vary from place to place. Kendon (1995) has for some years studied the gesture culture of Naples, a locale with an exceptionally rich repertoire of quotable gestures (cf. de Jorio, an early 19th-century figure, in Kendon, 2000). These gestures are meaningful without speech, although they also occur with speech. They function like illocutionary force markers, rather than propositions, the mode of gesticulation, and the timing when they occur with speech, being quite different. A single Neapolitan emblem for 'insistent query' (the 'purse' or *mano a borsa*: prototypically, the hand palm up, the fingers and thumb loosely bunched together at the top, and rocking up and down) was observed in one case stretching over several utterances and then continuing into the next speaker's turn, still demanding clarification. This gesture is not employed in North America (a similar-looking gesture is used to mean that something is 'precisely so'), which illustrates the cross-cultural variation of the emblem. Emblems can blend both sequentially and simultaneously with gestures of other kinds. Many emblems have deep historical roots, far outlasting the spoken languages with which they occur. Some go back to Roman times (Morris *et al.*, 1979), including the infamous 'finger,' beloved of the American road – it would have been understood by Julius Caesar. Most emblems have iconic or metaphoric components. The contact of the thumb and forefinger in the 'OK' sign captures the idea of precision. But the emblem is also specified by a convention pairing the form of the gesture to the approbation meaning. The fixity of the emblem is the evidence of this. Putting the *second* finger in contact with the thumb is still precision but no longer is the 'OK' sign of approbation.

'Pantomime' is dumb-show, a gesture or sequence of gestures conveying a narrative line, with a story to tell, produced without speech. And at the other extreme of the continuum, 'signs' are lexical words in a sign language such as ASL. Sign languages have their own linguistic structures, including grammatical patterns, stores of words, morphological patterns, etc. The linguistic code of ASL is quite unlike that of English. Sign languages have evolved without the requirement of being coordinated with speech. In fact, hearing signers find producing speech and signs simultaneously to be disruptive to both. For an authoritative description, see Liddell (2003).

As one moves along Kendon's continuum, two kinds of reciprocal changes occur. First, the degree to which speech is an obligatory accompaniment of gesture *decreases* from gesticulation to signs. Second, the degree to which a gesture shows the properties of a language *increases*. Gesticulations are obligatorily accompanied by speech but have properties unlike language. Speech-framed gestures are also obligatorily performed with speech, but relate to speech in a different manner – sequentially rather than concurrently, and in a specific linguistic role. Signs are obligatorily *not* accompanied by speech and have the essential properties of a language. Clearly, therefore, gesticulations (but not the other points along Kendon's continuum) combine properties – gesture with language – that are unalike, and this combination occupies one communicative instant. A combination of unalikes, at the same time, is a key psycholinguistic fact and a framework for an imagery–language dialectic. The remainder of this article focuses on gesticulations. If no ambiguity results, from here on I shall use the simpler term 'gesture.'

Traditions of gesture study not summarized in this article because of length are gestures of the theater (Fischer-Lichte, 1992), histories of gesture studies (Bremmer and Roodenburg, 1991), 'neurogestures' (McNeill, 2005), gestures in human–computer interface design (Kita *et al.*, 1998), methods of gesture transcription and measurement (Quek *et al.*, 1999), and the gestures of children (Bates and Dick, 2002), including home signs (Goldin-Meadow, 2003).

The Iconic, Metaphoric, Deictic, Beat Quartet

These categories or, as I will later say, dimensions are inspired by the semiotic categories of C. S. Peirce. Elena Levy and I proposed a classification scheme with four categories: iconic, metaphoric, deictic, and beat. All are gesticulations or speech-framed gestures on Kendon's continuum.

Iconic: Such gestures present images of concrete entities and/or actions. For example, appearing to grasp and bend back something while saying "and he bends it way back." The gesture, as a referential symbol, functions via its formal and structural resemblance to event or objects.

Metaphoric: Gestures are not limited to depictions of concrete events. They can also picture abstract content, in effect imagining the non-imageable. In a metaphoric gesture, an abstract meaning is presented as if it had form and/or occupied space. For example, a speaker appears to be holding an object, as if presenting it, yet the meaning is not presenting a concrete object but an idea or memory or some other abstract 'object' (for examples, see McNeill, 1992; Cienki, 1998). This is a gestural version of the conduit metaphor that appears in expressions such as 'he packed a lot into that lecture,' where the lecture is presented as a container and the message as its contents (Lakoff and Johnson, 1980). Recent work on metaphoric gestures has greatly expanded the subject. Müller (2004) developed a new theory of metaphor as a dynamic process (whereby 'sleeping' metaphors are 'awakened' in context) in which metaphoric gestures play an essential part. Parrill and Sweetser (forthcoming) develops a new theoretical account based on 'mental spaces blending theory.' Metaphoric gestures often indicate that the accompanying speech is meta rather than object level – for example, saying "the next scene of the cartoon" and making a conduit cup of meaning gesture (iconic gestures, in contrast, favor the object level).

Deictic: The prototypical deictic gesture is an extended index finger, but almost any extensible body part or held object can be used. Indeed, some cultures prescribe deixis with the lips (Enfield, 2001). Deixis entails locating entities and actions in space *vis-à-vis* a reference point, which Karl Bühler called the 'origo' (Bühler, 1982; Haviland, 2000). Much of the pointing we see in adult conversation and storytelling is not pointing at physically present objects or locations but is abstract pointing, which Bühler referred to as "deixis at phantasma." The emergence of abstract pointing is a milestone in children's development. In striking contrast to concrete pointing, which appears before the first birthday and is one of the initiating events of language acquisition, abstract pointing is not much in evidence before the age of 12 and is one of the concluding events (McNeill, 1992).

Beats: Such gestures are so called because the hand appears to be beating time. Other allusions to the musical analogy use the term 'baton' (Efron, 1941). As forms, beats are mere flicks of the hand(s) up and down or back and forth, zeroing in rhythmically on the prosodic peaks of speech. This rhythmicity has made beats seem purely speech related. However, they also have discourse functionality, signaling the temporal locus of something the speaker feels to be important with respect to the larger context. One can think of a beat as a gestural yellow highlighter.

With these four categories, Levy and I were able to classify nearly all gestures in the narrative materials we collected. Other researchers have proposed more finely subdivided categories.

Dimensions Rather than Kinds

I wish to claim, however, that none of these 'categories' is truly categorical. We should speak instead of *dimensions* and say: iconicity, metaphoricity, deixis, 'temporal highlighting' (for beats), social interactivity, or some other equally unmellifluous (but accurate) terms conveying dimensionality.

The essential clue that these are dimensions and not categories is that we often find iconicity, metaphoricity, deixis, and other features mixing in the same gesture. Beats often combine with pointing, and many iconic gestures are also deictic. We cannot put them into a hierarchy without saying which categories are dominant, and in general this is impossible. A practical result of dimensionalizing is improvement in gesture coding, because it is no longer necessary to make forced decisions to fit each gesture occurrence into a single box.

Tight Binding

The temporal binding of speech and gesture is almost impervious to forces trying to interrupt it. The very heterogeneity of the following observations shows the inviolability of the speech–gesture unit (see McNeill, 2005 for details).

Gesture synchrony and DAF: Delayed auditory feedback or DAF has a dramatic effect on the flow of speech, which slows down, becomes hesitant and is subject to drawling and metatheses (spoonerisms). Nonetheless, despite the interruptions, speech and gesture remain in synchrony.

Gesture inoculates against stuttering: Mayberry and Jaques (2000) made two noteworthy observations. First, the onset of a gesture stroke inoculates against the onset of stuttering. Second, if stuttering

begins *during* a stroke, the speaker's hand freezes in midair and may fall to rest. In both observations, we see an incompatibility between the interruption of speech in stuttering and the occurrence of the meaningful gestures.

Gestures of the blind: Congenitally blind speakers, who have never observed gestures, nonetheless do gesture and do so as frequently as sighted subjects, and gesture even when they know are talking to another blind person (Iverson and Goldin-Meadow, 1998). This is dramatic evidence of a speech – gesture bond.

Information exchange: Information received in a gesture may be recalled later as speech (not gesture) (Cassell *et al.*, 1999). Symmetrically, Kelly *et al.* (1999) observed subjects recalling information presented in speech as having been gestural.

Gestures and fluency: Speech and gesture become complex or simple in tandem, even to the point of jointly disappearing (the gesture disappears along with speech, rather than replacing it).

To sum up binding, speech and synchronous coexpressive gestures form a tightly bound unit, capable of resisting outside forces attempting to separate them, such as DAF, stuttering, lack of visual experience of gesture, and loss of fluency. Speech and gesture also spontaneously exchange information in memory, so that when something is recalled the speaker cannot tell the original format. Tight binding clearly fosters an imagery–language dialectic by creating unbreakable psycholinguistic units within which it can take place.

Gesture Anatomy

The anatomy in question is temporal, an anatomy of 'phases.' The gesture illustrated in Figure 1 includes all phases except a final, retraction phase, which did not occur in this case because a new gesture followed immediately. The speaker had been given a comic book to read and was retelling the story to a listener from memory. The transcription, by S. Duncan, is as follows: "so he gets a / hold of a big [oak tree / and he **bends it way ba**ck]." Notation: / denotes a silent pause; [the onset of motion; underlining a hold; boldface the stroke;] the end of motion.

Unfolding in Time and Its Meaning

As this example illustrates, gestures pass through a series of phases, each with its own position and function in the gesture. The phases enable us to peer into performance dynamics. Kendon (1980) differentiated among what he termed "gesture units," "gesture phrases," and "gesture phases."

A gesture unit is the interval between successive rests of the limbs. In the example, the gesture unit

Figure 1 Gesture phases in the 'and he bends it way back' gesture. The insert is a frame counter (1 frame = 1/30 s.). The total elapsed time is about 1.5 s. Panel 1: Prepreparation position. Hand is shown just prior to lifting off from the armrest. Panel 2: A Prestroke hold occurs while saying 'he' – the hand waiting for 'bends.' This figure depicts the hand at the start position of the stroke (ready to pull down and to the rear). The preparation interval was slightly less than 1 s. Panel 3: Middle of stroke – 'way.' The hand has closed around the 'oak tree' and is moving downward and to the rear. Note how the speaker's own position in space defines the location of the oak tree and the direction of the bending-back movement – the gesture framed according to a 'first-person' or 'character' viewpoint. Panel 4: End of stroke and beginning of the poststroke hold in the middle of 'back.' Hand is at its farthest point to the rear. After the poststroke hold, the hand immediately launched into a new gesture.

included not only the interval from 'oak' to 'back,' but also further speech and later gestures not shown.

A gesture phrase is what we intuitively call a 'gesture' and it in turn consists of up to five gesture phases, in sequence:

- Preparation (optional): The limb moves away from a rest position into the gesture space, where it can begin the stroke. The onset of preparation shows the moment at which the visuospatial content of the gesture starts to take form in the cognitive experience of the speaker. 'Oak tree and' coincided with the preparation phase in the illustration, and it is noteworthy that the preparation commenced with the first mention of the object in the preceding clause – as the idea was introduced, so the next image flicked on to become a gesture.
- Stroke (obligatory in the sense that, without a stroke, a gesture is not said to occur): The stroke is the gesture phase with meaning; it is also the phase with effort, in the dance notation sense of focused energy. In the example above, the stroke was the bending back, the hand in a grip around something thick, timed with the coexpressive 'bends it way back.'
- Retraction (optional): The hands return to rest (not always the same position as at the start). There may not be a retraction phase if the speaker immediately moves into a new stroke, as was the case in the illustration.

In addition, Sotaro Kita identified:

- Pre- and poststroke hold phases (optional): Temporary cessations of motion either before or after the stroke motion; in the example a prestroke hold occurred during 'he' and a poststroke hold during the second half of 'back'; holds ensure that the meaningful part of the gesture – the stroke – remains semantically active during the coexpressive speech. Holds suggest that the stroke and the coexpressive speech comprises an idea unit created in advance, from the start of the preparation phase.

The gesture phases are organized around the stroke. This is the 'object' being presented. It is prepared for, withheld if need be until the coexpressive speech is ready, and held again until all linked speech is over. The full span of phases, from the beginning of preparation to the end of retraction, describes the lifetime of a particular gesture and its linked idea unit.

Coexpressiveness and Synchrony

Gesticulations (but not other points along Kendon's continuum) have the property that strokes synchronize with coexpressive speech. This section explains this concept. An example is illustrated in Figure 2. The speaker was describing a cartoon episode in which one character tries to reach another character by climbing up a drainpipe on the inside. The speaker is saying "and he tries going **up thróugh** it this time," with the gesture occurring during the boldfaced portion (the illustration captures the moment at which the speaker is saying the vowel of 'through'). Coexpressively with 'up' her hand rose upward, and coexpressively with 'through' her fingers spread outward to create an interior space. The upward movement and opening of the hand took place simultaneously, and both were synchronized with 'up through,' the linguistic package that carries the same meanings. The effect is a uniquely gestural way of packaging meaning – something like 'rising hollowness,' which does not exist as a semantic package of English at all. The gesture and the linguistic construction synchronize as a whole, not component by component. Thus, speech and gesture synchronize at the point where they are coexpressive and this, not the components, is the unit that aligns them.

Growth Points and Context

Synchronous combinations of such unlike modes of cognition – visuospatial-actional gesture synchronized with analytic-combinatoric speech – may be operative psycholinguistic units, termed 'growth points' or GPs (McNeill and Duncan, 2000). One way to think of a GP is as imagery that is categorized linguistically, an image with a foot in the door of language. A GP is inferred from the totality of communicative events, with special focus on speech–gesture synchrony and coexpressivity. It is called a growth point because it is meant to be the

Figure 2 Synchronous, coexpressive gesture with 'up thróugh.' Accent indicates a stressed vowel.

initial form of a thinking-for-speaking unit out of which a dynamic process of utterance and thought organization emerges.

The Psychological Predicate Regarding the GP as a psychological predicate (a term from Vygotsky, 1986 – not always a grammatical predicate) suggests a mechanism of GP formation in which differentiation of a focus from a background plays an essential part.

The concept of a psychological predicate illuminates the theoretical link between the GP and the context of speaking. Defining a psychological predicate requires reference to the context; this is because the psychological predicate and its context are mutually defining. The psychological predicate (1) marks a significant departure in the immediate context, and (2) implies this context as a background. We have in this relationship the seeds for a model of real-time utterance generation and coherent text formation.

First, when gestures and speech synchronize they jointly form the contrast underlying a psychological predicate. Second, the form of the gesture embodies the content that makes this differentiation meaningful. These correspondences can be demonstrated by exploiting a quirk in the cartoon stimulus that we have employed, in which Sylvester attempts to reach Tweety by climbing a drainpipe conveniently running up the side of the building from street level to the floor where Tweety is perched; he does this twice – first on the outside of the pipe, then on the inside. If a speaker recalls both attempts and in the correct outside-inside order, the gesture–speech combination relating to the second attempt includes a focus on interiority; this is the differentiating element. If a speaker misses the outside attempt but does recall the inside attempt, or recalls them in reverse order, interiority does not now contrast with exteriority, and the gestures with such recall do not include it as a particular feature. These results have been reported by Susan Duncan at workshops; I summarize them, with illustrations, in McNeill, 2005.

Contexts and Catchments

The context of differentiation is an empirically approachable concept via gestures that organize themselves into 'catchments.' A catchment is recognized when one or more gesture features recur in at least two (not necessarily consecutive) gestures. The logic is that a discourse theme will produce gestures with recurring features. These gesture features can be detected. Then, working backwards, the recurring features offer clues to the cohesive linkages in the text with which they co-occur. A catchment is a kind of thread of visuospatial imagery that runs through a discourse to reveal the larger discourse units that emerge out of otherwise separate parts. The recurring features can include hand use (right hand, left hand, two hands similarly deployed, two hands differently deployed), space, orientation, trajectory, hand shape and position, and others, although these are the most common.

By discovering the catchments created by a given speaker, we can see what this speaker is combining into larger discourse units – what meanings are being regarded as similar or related and grouped together, and what meanings are being put into different catchments or are being isolated, and thus are being seen by the speaker as having distinct or less related meanings.

Viv's Catchments I shall use one speaker's recounting of an episode from the cartoon stimulus to demonstrate catchments and how they can be used to imply something of the dynamic process of utterance formation.

The episode involves a bowling ball, and follows directly the ascent inside the drainpipe described earlier. Tweety, seeing Sylvester, fetches a bowling ball and drops it into the top of the pipe; the ball and Sylvester meet in the middle; Sylvester shoots out of the bottom of the pipe, the bowling ball now inside him; he rolls, bowling ball style, down an inclined street and into a bowling alley; after a significant pause, there is the sound of pins being knocked over.

Viv's gesture performance reveals three catchments, recognizable from hand use and hand shape/position:

C1. The first catchment involves one-handed gestures, and accompanies descriptions of Sylvester's solo motion, first up the pipe, then out of it with the bowling ball inside him. Thus, C1 ties together references to Sylvester as a solo force.
C2. The second catchment involves two-handed symmetrical gestures that group descriptions where the bowling ball is the antagonist, the dominant force. Sylvester becomes what he eats, a kind of living bowling ball, and the symmetrical gestures accompany the descriptions where the bowling ball asserts this power.
C3. The third catchment involves two-handed asymmetrical gestures and groups items in which the bowling ball and Sylvester mutually approach each other in the pipe. Here, in contrast to the symmetric set, Sylvester and the bowling ball are equals differing only in their direction of motion.

With these catchments, we can analyze the real-time origins of the utterance and gesture in the accompanying example, in a way that incorporates context as a fundamental component. The illustrated example is in the symmetrical C2, which shows that

Figure 3 Downward stroke with '**it do**wn.'

one of the factors comprising its field of oppositions was the various guises in which the bowling ball appeared in its role of an antagonist. That is, the idea unit was not only dropping the bowling ball but the bowling ball as a force in its own right. We can write the meaning of the psychological predicate as 'Antagonistic Force: Bowling Ball Downward.' This was the context and contrast. Thus, 'it down' (see Figure 3), unlikely though it may seem as a unit from a grammatical point of view, was the cognitive core of the utterance – the 'it' indexing the bowling ball, and the 'down' indexing the significant contrast itself in the field of oppositions. And the verb 'drops,' therefore, was *excluded* from this GP; it referred to something Tweety did, not what the bowling ball, as a force, did.

Viv's gesture in Figure 3 was made with two symmetrical hands – the palms loosely cupped and facing downward as if placed on top of a large spherical object, and the hands moved down during the linguistic segments 'it down.' The inferred GP is this image of downward movement plus the linguistic content of 'it' (i.e., the bowling ball) and the path particle 'down.' The stroke *excluded* the verb, 'drops.' The full utterance was "Tweety runs and gets a big bowling ba[ll and drops **it do**wn the drainpipe #]."

The exclusion of 'drops' was not an accident. First, the preparation phase of the 'it down' gesture had two features that skip the verb. Preparation began at the first mention of the bowling ball in the preceding clause (again, preparation for the next gesture began with the object was first mentioned). This shows that the bowling ball was part of the discourse focus at that moment. And, second, preparation continued right *through* the verb, suggesting that the verb was irrelevant to this focus. Further, a brief prestroke hold seems to have preceded 'it down' (although coding varies), which, if present, targeted the stroke to 'it down.' Finally, a poststroke hold lasted exactly as long as it took to complete the spoken articulation of 'down,' which preserved the synchrony of the gesture and the word. So the stroke fully and exactly timed with just two words, 'it down,' and excluded a third, 'drops.' The rest of the utterance can be explained by 'unpacking' this GP via a construction (in this case, the caused motion construction, which provided the verb 'drops' as well as the ground element, 'the drainpipe'; cf. McNeill and Duncan, 2000).

Figure 4 Gestural mimicry. First panel is a gesture by the speaker to the right; second panel is mimicry by the speaker to the left.

Social Context

Lev Vygotsky, in his argument against Jean Piaget, famously asserted that everything appears in a child's development twice: first on the social plane, later on the psychological (Vygotsky, 1986). The concept of a social-to-psychological transition can be applied to gestures as well. Gestures imply a social other. If one denies access to a listener, the frequency of gesture declines (Alibali *et al.*, 2000). Increasing the number of listeners changes the shape of the gesture space and this in turn changes the direction of gestures depicting movements of characters in the story (Özyürek, 2000).

I shall conclude with examples of the social sharing of gestures. The research from which they are drawn is not yet published, but the phenomenon of social sharing or resonance through gesture is significant.

Mimicry and Two-Bodied Gestures Gestural mimicry occurs when one conversational partner, within a short time, reproduces the gesture of the other partner; the effect is often to cement a kind of social solidarity and is accordingly seen commonly between close friends. The example in Figure 4 from research by Irene Kimbara shows the woman on the

Figure 5 Gesture mimicry synchronized with the other's speech.

Figure 6 Gesture appropriation synchronized with the person's own speech.

left reproducing the gesture just performed by her friend on the right.

A different kind of shared gesture is also possible between strangers. Figures 5 and 6 are from Nobuhiro Furuyama, who studied the gestures of learners as they were instructed in a new motor task (origami). In each illustration, the learner is seated at the left (two different training sessions). In the Figure 5 example, the learner mimics the gesture of her tutor. The mimicry occurred without speech by the learner, but her *gesture* synchronized with the *tutor's speech*. As the tutor said "[pull down] the corner," the learner performed the gesture during the bracketed portion. The Figure 6 example, in contrast, shows the learner appropriating the tutor's *gesture* by combining it with her *speech*. The learner is saying "[you bend this down?]," and during the bracketed speech moved her hand to the tutor's hand, and then moved her hand downward and away (the illustration shows the start of the gesture). As Furuyama observes, the tutor had turned in his chair so that the same left–right gesture space was before him and the learner, a maneuver that might have invited her to enter his gesture space. It is striking that any taboo against strangers coming into physical contact was overridden while the hands were in a symbolic mode.

Examples of these kinds address what can be called collectively the 'social resonance' of gesture. Janet Bavelas has long been interested in this phenomenon. Bavelas *et al.* (2000) demonstrated resonance not from the viewpoint of shared feelings, the more traditional approach, but as joint cognition and storytelling; gestural repetition seems to act as grounding and in general conveys mutual understanding.

Gesture: Sociocultural Analysis

Gesture is Integrated with Utterance

When people come together to interact, they can exploit everything at hand (as we might say) to communicate with one another. They position their bodies in relation to both interlocutors and other copresent people; they manipulate objects in the surround; they orient their senses towards one another; they talk; they look; they listen; and they gesture – they move their bodies (and sometimes other entities as well) as part of interaction. Although this short article concentrates on gestures, mostly those performed with the hands, that form part of spoken utterances, much of what it describes could be extended to a wider range of 'gestural expression,' whether or not linked directly to speech, and including a variety of body parts (head, eyes, face, torso) and corporal techniques.

The keenest observers of human communicative capacities have always been interested in gesture.

Consider the expressive postures of clay or stone figurines from Palenque to Phnom Penh, or the fingers, hands, arms, faces, and bodies of human figures depicted on vases, walls, textiles, shields, masks, and canvases from Auckland to Greenland, or captured in snapshots and sketches from New York to New Guinea. Quintilian, the 1st-century Roman rhetorician, offered a treatise on how to use gesture artfully as part of oratorical persuasion. Grand speculative programs in the 18th and 19th centuries – programs which continue in perhaps less ambitious and explicit forms to the present day – found in gesture evidence for presumed universals in thought and language. Conversely, explorations of human diversity – especially in the 20th century – also found in gesture a fertile empirical ground to demonstrate divergence and cultural specificity. Important here was the rise of iconic recording technologies which allowed observers to reduce fleeting gestural performances to representation which could be indefinitely replayed and scrutinized for analysis. There is a related tension, in both pretheoretical and analytic fascinations with gesture, between nature and culture: between speech-accompanying gesticulation cast as 'pantomime,' 'protolanguage,' or 'natural pidgin' somehow grounded in presumed panhuman iconicity and expressivity, vs. the unpredictable culturally specific repertoire of gestures that clearly must be conventionally learned, used, and understood, and that remain opaque to non-natives. (Some Los Angeles natives perform an L-shaped hand on their foreheads to mean 'loser,' i.e., to indicate that some third person is a poor excuse for a human being – a gestural convention perhaps no less exotic that the Neapolitan 'hunger' or 'poor' gesture performed with a slapping motion toward the hip – see Kendon, 1992. The 'loser' gesture exists as an animated emoticon on at least one Internet instant messenger service.)

Contrasting bodily movements with other aspects of the utterances of which they form part, the expressive virtues of gesture both complement and differ from those of the digital, segmentable, and structurally contrastive elements of spoken language. Since it uses as an expressive medium the very body that is involved in human action in the first place, gesture can model action both directly and analogically. Even highly stylized pantomimes can illustrate aspects of action not verbally expressed, nor indeed easily expressible: complex configurations of objects and actors, perspectives, details of mechanics and effort in action. Contrasting with the linear flow of speech units, gesture unfolds in four dimensions, and easily combines multiple simultaneous signing vehicles (gaze, facial expression, posture, as well as hands and other extremities) in a miniature and multifunctional orchestra of expression. Utilizing space as well as time, gesture has a dimensionality, a potential persistence, and a spatial immediacy in the context of utterance not similarly available to sound. For example, a gesture can be held across a chain of utterances, thus providing a diagrammatic vehicle to anchor talk; or it can incorporate into a scene spatial elements – such as direction, distance, size, or shape – which receive no corresponding verbal expression.

Nonetheless, gesture and speech characteristically occur together, combining with still other expressive resources to coordinate interlocutors in the communicative process, and often with precise temporal and semantic coordination. Emblems – the culturally specific, learned gestural forms, with usually quite specific conventional readings, like an 'OK hand' or a locally defined obscene gestural imprecation – can cooccur with speech or, perhaps more often, simply replace it, even in the midst of conversational turns. They are thus a kind of language surrogate. Other sorts of gesture, however, seem to be inextricably linked to simultaneous speech. Researchers have repeatedly observed, for example, that depictive or representative iconic gestures – which seem to present images reminiscent of entities or events also receiving verbal mention – appear synchronized with, or temporally just antecedent to, apparently associated words, or 'lexical affiliates' as they are called. 'Formless' gestures, dubbed 'batons' or 'beats,' seem instead to track speech rhythm, falling at once on stressed syllables and points of presumed speaker emphasis. Furthermore, deictic gestures allow interlocutors to indicate referents spatially (although sometimes in virtual space), and thus provide a (sometimes seemingly indispensable) complement to roughly simultaneous spoken referential expressions, such as *this* or *that*.

Theorists adopt sometimes diametrically opposite positions, however, about the differences between gesture and speech as communicative resources. Some think gesture 'leaks,' betraying a speaker's true feelings and thoughts, perhaps in opposition to more treacherous (because more conscious?) words which may try to conceal them. Or they may see gestures as largely involuntary somatic twitches, simply reflecting the speaker's (or the mind's) struggle to externalize inchoate inner images as a linear sequence of verbal elements. This article will largely ignore the putative 'inner' processes that underlie gestural production, to concentrate instead on the semiotic and functional properties of gestures. We take for granted the communicative potential of gesture in the process of utterance, and its connections with social and cultural formations more generally. For just as gesture is integrated with utterance, tying words directly to a spatiotemporal context, it is also part of wider

cultural routines of the body, susceptible both to the stylization and persistence of custom – patterns of gesture have evidently remained largely intact in Naples for several centuries, much longer, no doubt, than patterns of speech – and to the ideological productions of culture to which we turn at the end of the article.

Meanings and Interactions

Gestures function like other signs, verbal or otherwise. To expand on a gestural typology already alluded to, a commonly cited Peircean trichotomy can be applied to gestures. Conventionalized – thus symbolic, in the Peircean sense – emblems, with specifiable 'citation' forms (thus, in Kendon's terms, 'quotable' – 'and then she did **this** [quoting the gesture]') and holophrastic as well as lexemelike meanings, except for their manual modality resemble certain spoken expressions. The conventionality can be seen partly in specific criteria of well-formedness (the circle of the 'OK hand' is made with the thumb and the index finger, with the others extended slightly upwards, not with just any fingers, and presumably not with other orientations of the hand, orientations which in other cultural settings can produce very different meanings). Conventionality is also evidenced by the families of use to which such culturally specific gestures are put. Indeed, emblems are in both form and function much like interjections, or 'response cries' (Goffman, 1976), which also may depart from the phonotactic canons of a language and which inhabit a characteristic expressive realm – often, for example, indexing various kinds of disapproval or designed for interpersonal social control – but which remain highly culture specific nonetheless.

There are symbolic and conventional aspects not just to a society's repertoire of emblems but to nonce gestures as well. Hand shape in gesture, for example, is sometimes highly specific: how one points, with what digits or other body parts, and what sorts of thing one can refer to with a specific sort of pointing gesture, are matters carefully (and symbolically) regimented in many cultural contexts. In Tepoztlan, Mexico (Foster, 1948), one used different hand shapes to show the height of a table, a donkey, or a child, and using the wrong sort of hand remains a potential insult throughout Latin America. Recent investigation proposes that even in spontaneous gesticulation different hand shapes come in 'families' with highly schematic shared meanings: 'precision' or 'offering,' for example, associated with the 'precision grip' (the touching thumb and index figure of the 'OK hand') or 'open palm' hands, or 'individuation' associated with a lone extended finger. Presumably, however natural the explanations for such groupings may seem, cultural tradition and transmission must be centrally involved in propagating such families of form.

Gestures are also heavily iconic, depicting aspects of objects and actions by selectively mirroring or diagraming shapes, movements, and configurations of entities or events that provide the vehicles for gestural interpretation. A Guugu Yimithirr man, for example, describes how his boat capsized in a storm. He gesturally evokes the rolling motion as the boat was picked up by the wind and tossed on its side (Figure 1), saying "like **this**." Resemblance is, of course, a feeble principle for interpreting a sign, and interlocutors must always infer what aspects of a demonstration they are to attend to – one reason that words and gestures frequently complement one another semiotically, or that gesticulation uninformed by the accompanying words may remain obscure, until the soundtrack (or the subtitles) are turned back on. Because gestures iconically – if schematically – demonstrate actions and depict objects, they can also incorporate varying perspectives or viewpoints on such action, often more directly than can syntactic and lexical devices which imply voice or valence. A gesturing hand can represent now an object, now a tool for operating on it, now an actor manipulating it, and now an observer of the scene. Gesture can also suggest granularity or resolution (for example, in gestures accompanying directions or instructions), as well as specifics of the configuration and shapes of objects – a principle exploited in sign language nominal classifiers, and used to advantage in spontaneous gesticulation as well. A hand holding even an imaginary object adjusts itself to its shape and weight.

Figure 1 First shipwreck gesture.

Finally, gestures indexically project the contexts of their occurrence. The rhythmic gesticulations called beats, mentioned above, are almost pure indexes, tracking the speech stream much in the way a conductor tracks a score, and additionally parsing it into significant segments. Even the most wooden of gesturers – from Englishmen to presidential candidates – seem to punctuate their syllables gesturally. However, the observed synchrony between gestures in general and their apparently affiliated words is itself an indexical trace of the temporal unfolding of an utterance. A pointing movement, another classic indexical sign, may pick out a perceptually available referent, but it may also create an invisible one in thin air, leaving it available for later resumption by gestural (or spoken) anaphor. Clark (2003) describes a range of object manipulations, which he calls 'placing,' to achieve referential ends parallel to those of 'pointing.' Crucially, gestures of 'placing' depend for their success on the structure of space – and of particular culturally significant spaces (from store counter tops or queues, in Western society, to the hearth or the notorious witchcraft cave in, for example, indigenous Mexico).

Pointing gestures are of particular interest because they combine all the Peircean modalities and additionally require careful conceptual coordination between interlocutors to convey their meanings. Consider the case of Rosa, in Figure 2, who makes a complex double pointing gesture, when she reaches the climax of a story about an elderly woman who opened the downstairs door of her house to some threatening men. Afraid, she wanted to escape out the same door, but could not because she had left the upstairs door to the house itself unlocked. In Friulian, Rosa narrates the older woman's dilemma in the present and in the first person: "*Nopos la vie parze che o ai lepuarte viarte* [I cannot leave because I have the door open]." She performs the double pointing gesture in two stages: her left hand reaches out with the fingers extended loosely to the right when she says "I cannot leave"; then her right hand – which has accompanied the other in the move to the right – forms a pointing hand and points up to her left as she says "the door open." The gesture invokes diagrammatically the configuration of the house (an outside door to stairs which lead up to the main dwelling) which Rosa's audience knows well. It indexes the relevant locations in that conjured space. Rosa uses conventional index finger pointing to signal the unlocked door, and a looser pointing hand to show the blocked escape route. And, interactionally, the double point captures perfectly the protagonist's dilemma: a choice between two impossibilities.

Figure 2 Double pointing gesture.

Directional indexicality also infects gestures otherwise based on quite different semiotic principles. A gestural imprecation, for example, can be performed in a specific direction, indexing at once its target and its author. A depiction can combine the representation of a referent's size with an indexical indication of its position. In the shipwreck example mentioned above, the gesture not only illustrates the boat's rolling motion but also indexes the cardinal direction in which the boat flipped over, given prevailing storm winds. Contrast Figure 1, where the speaker has north to his right, and shows the boat flipping in front of him, i.e., to the west, with another performance of the same story where the narrator is facing north, and depicts the boat flip with a very different motion, but in the same direction (see Figure 3). Indeed, the shipwreck gesture illustrates a perhaps unexpected sort of gestural convention, since it is a norm for speakers of Guugu Yimithirr (and in other communicative traditions, too) that gestures depicting motion, real or hypothetical, remain faithful to cardinal orientation (Haviland, 1993).

Though most research has concentrated on gestural 'meaning,' gestures (along with attitudes of the body more generally) are clearly central in coordinating (inter)action. The preconditions of face-to-face communication involve positioning bodies to allow, restrict, or prevent mutual access. Moreover, states of talk can be restructured and reorganized in part by the talk itself, and in part by reorientations of interlocutors brought about by gesture, shifts in gaze, and adjustments of posture. Theories of the ontogenesis

Figure 3 Second shipwreck gesture.

of gesture often link children's manipulation of objects as the source for later gestural 'ritualization.' Pointing, for example, appears to grow out of grasping and reaching. Even in adults, handling objects, moving them, and directing attention to them and to the spaces around them seem to give rise to gestural routines which, in turn, can become routinized or 'grammaticalized' through the course of an interaction. Gesture is thus embedded in bodily techniques, themselves notoriously shaped by cultural practices.

Ideologies of Gesture

Like other cultural practices, gesture when it rises to explicit consciousness inspires metatheory and ideology. The most astute early students of gesture, from de Jorio to Efron, comment with skepticism on theories which purport to link the proclivity to gesture, or gestural exuberance, to aspects of personality or temperament, if not to gentility and good breeding, or even to race and national character. The fact that such links have been advanced, nonetheless, suggests something about a an ethnotheory of the communicative economy which gesture and speech jointly inhabit. The fact that some populations – ranging from Warlpiri women in mourning, who must not blurt out certain tabooed words (Kendon, 1988), to members of monastic orders who abjure the worldliness of words – voluntarily substitute elaborated, conventionalized systems of gesture for speech, is a kind of reversal of the common injunction on children in other societies not to point or impolitely overuse their hands in talk.

Arguments about the communicative virtues of gesture seem always to involve subtle and perhaps contradictory ideological stances: Roman orators (like modern-day politicians) hoped to become more persuasive through calculated use of gestures; but pop psychologists argue that 'body language' is truer – precisely because deeper and less susceptible to conscious manipulation – than words. Some theories find gestures peculiarly appropriate to situations where words fail – over great distance, or in situations of too much (or too little) noise; others find virtue in their surreptitious and silent potentialities (as in the case of the Cuna lip point [Sherzer, 1972], which can be a vehicle for clandestine criticism or mockery). Finally, the analytical debates about whether gesture is a speaker's or a hearer's phenomenon (i.e., whether it is, in the psychologists' parlance, 'communicative') reflect pernicious dichotomies that surround such culturally specific notions as volition and intention, individual vs. community, or knowledge/mind vs. practice/body.

Gestures: Pragmatic Aspects

J Streeck, University of Texas, Austin, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

(Hand-) gestures play many diverse roles in human life and do many different jobs in social interaction. Gesture – simple emblems like the thumbs-up sign as much as ongoing gesticulation that accompanies talk – is a most flexible resource that is utilized in a multitude of cultural practices, ranging from legal proceedings to work in mines to the making of music and intimate moments of talk, and it is always in play when people collaborate with their hands on common tasks. The practices of gesture are heterogeneous and difficult to subsume under a common denominator, other than that the activity involves communicative action of the hands. The view adopted here is focused by the question how gesture serves persons – *embodied actors* – who are acting in the world together, within specific ecological and cultural settings, and together making sense of it; gesture is conceived as a mode (or set of modes) of bodily action by which the world is structured, known and understood, not in the first place as a system of signs or a mode of expression.

Gesture serves human activities, including conversation, in a number of different capacities that can be conceived as *alignment-types*: ways of aligning people, gesturing hands, and the situated world within which they interact. Alignment types are distinguishable on the basis of the framework of participant orientation within which gestures are perceived and understood, i.e., in terms of their alignment and coordination with gaze, speech, action, and the setting or landscape within which the interaction takes place. Six alignment types are distinguished here, leaving open the possibility that there are others:

1. hand gestures can aid in the structuring and making sense of the **world-at-hand** (i.e. the world **within** reach of the hand);
2. they can serve for orientation within and understanding of the **world-within-sight** (but **beyond** reach of the hands);
3. gestures can represent or **depict** the world in its absence, within the 'gesture space' (McNeill, 1992) that is created by the participants' orientation to the gesturing hands;
4. hand gestures, often in combination with other bodily action, can **embody communicative action** and discourse structure;
5. they can **mediate and regulate transactions**; and
6. they can construe content that is conveyed by the verbal utterance that they accompany (**ceiving/ception**).

In the following, the features of each alignment type are described, and gestural practices that are characteristic of it are discussed. The last section of the article delineates aspects of the coordination of gesture and speech.

Making Sense of the World at Hand

A great deal of inconspicuous gesturing occurs while people and their hands are actively engaged with the world at hand. Gestures arise as a byproduct of and in the service of practical action, disclosing features of the immediate scene, or otherwise involving the touching, feeling, grasping, and handling of whatever is at hand, and maybe the making of something from it. Gestural practices that are coupled with the world at hand are often excluded from the study of gesture, which is treated as movement in the air by empty hands. However, wherever cooperation involves the handling or making of things (including the making of graphic marks on paper), one finds manifold

(Hand-) gestures play many diverse roles in human life and do many different jobs in social interaction. Gesture – simple emblems like the thumbs-up sign as much as ongoing gesticulation that accompanies talk – is a most flexible resource that is utilized in a multitude of cultural practices, ranging from legal proceedings to work in mines to the making of music and intimate moments of talk, and it is always in play when people collaborate with their hands on common tasks. The practices of gesture are heterogeneous and difficult to subsume under a common denominator, other than that the activity involves communicative action of the hands. The view adopted here is focused by the question how gesture serves persons – *embodied actors* – who are acting in the world together, within specific ecological and cultural settings, and together making sense of it; gesture is conceived as a mode (or set of modes) of bodily action by which the world is structured, known and understood, not in the first place as a system of signs or a mode of expression.

Gesture serves human activities, including conversation, in a number of different capacities that can be conceived as *alignment-types*: ways of aligning people, gesturing hands, and the situated world within which they interact. Alignment types are distinguishable on the basis of the framework of participant orientation within which gestures are perceived and understood, i.e., in terms of their alignment and coordination with gaze, speech, action, and the setting or landscape within which the interaction takes place. Six alignment types are distinguished here, leaving open the possibility that there are others:

1. hand gestures can aid in the structuring and making sense of the **world-at-hand** (i.e. the world **within** reach of the hand);
2. they can serve for orientation within and understanding of the **world-within-sight** (but **beyond** reach of the hands);
3. gestures can represent or **depict** the world in its absence, within the 'gesture space' (McNeill, 1992) that is created by the participants' orientation to the gesturing hands;
4. hand gestures, often in combination with other bodily action, can **embody communicative action** and discourse structure;
5. they can **mediate and regulate transactions**; and
6. they can construe content that is conveyed by the verbal utterance that they accompany (**ceiving/ception**).

In the following, the features of each alignment type are described, and gestural practices that are characteristic of it are discussed. The last section of the article delineates aspects of the coordination of gesture and speech.

Making Sense of the World at Hand

A great deal of inconspicuous gesturing occurs while people and their hands are actively engaged with the world at hand. Gestures arise as a byproduct of and in the service of practical action, disclosing features of the immediate scene, or otherwise involving the touching, feeling, grasping, and handling of whatever is at hand, and maybe the making of something from it. Gestural practices that are coupled with the world at hand are often excluded from the study of gesture, which is treated as movement in the air by empty hands. However, wherever cooperation involves the handling or making of things (including the making of graphic marks on paper), one finds manifold

indexical, iconic, and symbolic actions of the fingers and hands, and often these are entirely indispensable, given the type of activity underway and the communication tasks that it raises for the practitioners (Ochs, Gonzales *et al*., 1996).

Among the 'jobs' that gestures do in the world-at-hand are: to structure the participants' perception of objects; to disclose intrinsic, invisible features and affordances of things; to analyze, abstract, and exhibit action; and to 'mark up' the setting. Gestures can arise as minimal modulations of instrumental acts, performed for the benefit of the coparticipants, e.g., in the context of demonstrations.

Genres of gestural practice found within the world-at-hand include, among others:

Tracing: An index finger, set of fingers, or hand is moved along a surface, thereby drawing a line, but also gathering tactile information, in order to discover (feel), disclose, and broadcast undisclosed features of objects or to inscribe real or imaginary marks on surfaces (e.g. to suggest possible features and fields of action). Goodwin writes:

> A quite general class of cognitive practices consists of methods used to divide a domain of scrutiny into a figure and a ground, so that elements relevant to the activity of the moment stand out. . . . Through these practices structures of relevance in the material environment can be made prominent (Goodwin, 1994).

Exploratory procedures (see Gibson, 1962): These are patterned actions by which hands systematically explore intrinsic object properties (texture, volume, consistency, temperature, brittleness) and affordances (what can be done with objects). While these actions serve the information-gathering needs of the actor, they are easily enhanced so as to disclose, i.e., make visible and broadcast, the qualities that are discovered through them. Demonstrative haptic or tactile explorations provide for shared understandings of the material features and functional characteristics of the things that require our attention.

Highlighting action and its accessories: Practical actions or their stages are elaborated through formal operation such as exaggeration, repetition, and segmentation, to disclose their logic, components, and characteristics to coparticipants. Gesturalization serves as a method for the self-explication of manual action. Minimal modifications – e.g., the repetition or exaggeration of a component act – can serve to draw attention to stages or accessories of the activity.

When the participants employ artifact-based representation practices (e.g., writing, diagramming, doodling) in addition to speaking and gesture, as is common in many lines of work, gesture can become aligned and enmeshed with them (Streeck and Kallmeyer, 2001), which can result in hybrid symbolic acts (e.g., symbolic gestures committed to paper, a line drawn on paper to emphasize a currently spoken word); situated, ephemeral graphic artifacts such as doodles and/or the acts of making them thus take on social-symbolic functions. Gesture is also indispensable as a medium for the interpretation of professional diagrammatic representations: architectural and engineering blueprints, for example, are enhanced by gestures showing motion, changes over time, or the dimension of height that the flat diagram lacks.

What distinguishes this entire variety of gesture uses from other basic varieties is their alignment within the material, perceptual, and cognitive ecology of the situation: they are perceived and understood by reference to their contiguity with objects and instrumental acts. In other words, the participants' visual attention encompasses gestures and things, and these elaborate one another. Gesture directs the recipient's attention, an effect that is also achieved by the placing of objects in the recipient's line of regard. Gesturing about and arranging objects are activities that serve epistemic functions and often go hand in hand (Kirsh, 1995).

Revealing the World within Sight

A different framework of person-gesture-world alignment is realized when the gesture orients the participants to the visible world beyond the reach of the hands. This is the prototypical realm of pointing: an extended index finger or hand (or another array of body parts whose constellation can be seen as a vector) enables the participants to coordinate their orientation so that they jointly focus their gaze on a distant object, feature, or location. Pointing is only one type of orienting behavior, however; posture, gaze direction, and head orientation can serve similar purposes, as can the placing of an object in the interlocutor's line of regard (Clark, 2003). And pointing is not universally executed with an extended index finger (Wilkins, 2003); other varieties include lip-pointing (Sherzer, 1972) and pointing by gaze and movements of the head. Within a given repertoire, there may also be pragmatically motivated alternatives such as pointing by index finger – to individuate an object among other objects – and pointing with the open hand – to select an object as an exemplar of a kind (Kendon and Versante, 2003). Handshape and motion patterns can also serve to **characterize** the focal object, i.e., to shape the recipient's perception of it. Gestures made in this mode serve spatial orientation as well as the sharing of sights: once a shared visual focus is established, what is seen together can then be structured by gesture; motions of the

fingers and hands project lines, vectors, points, etc., onto seen scenes, indicating **how** what is visible should be regarded. The visual field – i.e., the culturally structured landscape within sight – is thus augmented and made intelligible by layers of cognitive-manual actions and forms.

Depiction by Hand

The third alignment type of hand gestures is brought about when interaction participants turn away from the world and focus attention inside their interactional huddle, and, by their bodily orientation and positioning in space, mark off the space between them as territory of their interaction. The interaction space becomes the stage for hand gestures when attention is, however fleetingly, focused on the speaker's gesticulating hand(s) (Streeck, 1993). This happens whenever gesture is employed as a representation device, to depict aspects of the talked-about world, whether concrete or abstract, real or imagined. When gesture is used to depict or represent, for example in the context of narrative, recipient attention is solicited for the gesturing hands. This is done, for example, by including deictic expressions in the talk, some of which, for example deictic adverbs (Spanish *asi*, German *so*), seem to be primarily designed for this task. In the context of depiction, gesture is a foregrounded activity. Descriptive (depicting) gestures represent worlds in collaboration with speech, and they are understood by reference to what is **known** about the world, not what is seen at the moment.

While the category 'iconic gestures' is a familiar one, the actual study of gestural depiction is in its infancy (but see Müller, 1996; Kendon, 2004). The most detailed accounts describe iconic devices in sign languages of the deaf (Mandel, 1977), which however operate under different conditions and carry different representational loads; they function in part by virtue of their paradigmatic relations to other signs within large, conventionalized repertoires. Practices by which worlds are depicted on the gesture stage include the placing of imaginary objects on the stage; diagramming relations between them; enacting practical action schemata; sculpting volumes; and drawing outlines, among others. Some of these representational practices may be derived from other cultural practices (e.g., from drawing in sand). Most important, because most readily available to the hands, are acts of virtual grasping and handling, by which objects and instruments are evoked.

When complex imagery is assembled over time, as is the case when complex objects or events are described, the two hands often complement one another: one may 'hold' and classify the object, the other supply additional characterizations or arguments (Enfield, 2004). Repertoires of routinized and sometimes specialized methods of gestural depiction are part of the tacit communicative skills required by various professions, including designers and engineers.

Gestural depiction does not work by virtue of the hands producing shapes that **resemble** real-world phenomena, but rather because in a given context an action of the hand can be seen as **characterizing** a phenomenon or experience, and much as any phenomenon can be characterized by a multitude of words, it can be characterized by a multitude of gestures. Often, although essential to the success of the communication, the representational load of a gesture is minimal, because it is embedded within rich linguistic descriptions, and all it must do is to evoke a single feature for the practical purposes of the activity at hand (Arnheim, 1969).

Embodying Speech and Communicative Action

Another alignment type and functional genre of hand gestures that is common in the context of conversation, but also occurs interwoven with gestures of other alignment types, is the use of the hands in the embodiment of communicative action. This includes gesturing by which the communicative act performed (question, proposal, imploring, and so on); aspects of the pragmatic and syntagmatic structure of the unfolding utterance; and coherence relations between successive or separate utterance parts are shown or foreshadowed. A minimal version of this mode of gesturing are beats, i.e. hand movements characterized less by a distinct handshape or form than by repetitiveness and emphatic synchronization with the rhythm of speech, and signifying not so much by form as by changes in form which cue the beginning of a new speech unit. The pragmatic mode of gesticulation also includes pronominal referential gestures: pointing-like motions, often made by the thumb, which individuate and refer figuratively within the universe of discourse, marking acts of reference to nonpresent people, locations, or points in time. And it includes the display of the stance that the person takes towards an utterance or the content expressed. Pragmatic gesture encompasses all actions of the hands (and a variety of other body parts, notably the face, head, and shoulders) by which aspects of the communicative interaction are displayed. The category also includes recipient actions, such as head gestures of affirmation and negation or rejection that are known throughout human societies. Speech act gestures (gestures that embody illocutionary

force) often possess metaphorical quality: they figure aspects of the processes of speaking and communicating as handlings of physical objects or as conduit (McNeill, 1992) (*see* **Speech Acts and Grammar**).

The characteristic alignment of pragmatic gesturing is its occurrence at the periphery of the interaction space: such gestures are commonly executed outside the line of sight of the speaker and at the periphery of the visual range of the addressee. They are rarely subjected to the speaker's visual control. While this is the unmarked way in which communication is embodied, occasionally pragmatic gestures are made salient by being performed in the segment of the interaction space that is usually reserved for gestural depiction. Generally during conversation, the embodiment of speech and communicative action and process by hand gestures is a background process. But pragmatic gesturing is also the most ubiquitous, irrepressible, and perhaps indispensable variety of gesture, contributing greatly to the precision timing and entrainment that are characteristic of so much conversational interaction. Many societies have conventionalized at least some pragmatic gestures; some, such as that of southern Italy (Kendon, 1995), have evolved large repertoires (de Jorio, 2000 (1852)). Yet we also find immense individual variation in pragmatic gesturing; individuals tend to evolve habitual personal styles of gesticulation, and these idiosyncrasies are most obvious in pragmatic gesticulation.

Ordering and Enabling Transactions

Gesticulation in the pragmatic mode overlaps to a large extent with another usage variety; possible differences in alignment, however, suggest that it be treated as its own kind. This is gesticulation, that is also occupied with the communicative process, but at the same time addresses other interaction participants whose actions it is intended to regulate. This mode of gesturing can involve touching the other (Efron, 1972 (1942)), thereby eliciting attention or allocating a turn, soliciting response or attempting to silence it, and directing the attention of others to one another, among many other interactive and social-organization functions that these gestures serve. Many gestures blend the display of communicative action with the regulation of the behavior of others, and the distinction between these two modes is of only limited analytic value: at one end of the polarity, gestures are aligned with what the speaker is presently doing, and convey something about it; at the other end, they are performed in attempts to structure the actions of other participants. Often a gesture is aligned in both ways at the same time, or the two functions are realized at different points within the same gestural action.

Interactive or transactional gestures have enabled the development of codified, specialized gesture codes by which complex transactions such as vehicular traffic (the gestures of traffic cops), legal proceedings (as in medieval codes of law), or the making of music (through the gestures of conductors) are ordered or accomplished.

'Ceiving'

The last mode of gesturing included here is not usually treated as a distinct mode, but rather as the paradigmatic form of all gesturing other than pointing; however, it is easily distinguished in terms of the way it is aligned with the interaction participants' lines of regard as well as the current state and progress of talk. This is a mode of gesturing that is adequately described as 'thinking by hand': it involves the speaker's hands producing schemata in terms of which utterance content or narrated experience is construed. This mode is usually lumped together with gestural depiction (under the label 'iconic gesture'); however, although 'ceiving' or 'ception' is usually a component or means of gestural depiction (as well as of pragmatic gesticulation), it also occurs on its own, within an alignment framework that is different from both gestural depiction and pragmatic gesticulation. The 'pure' variety of ception is realized whenever speakers, **without attending to the process**, use their hands to give form to – i.e. construe – content. Often this is done via a simple or complex schema of grasping – by means of a prehensile posture (Napier, 1980), which is why this author labels it 'ceiving' or 'ception' (from Lat. *cap-*, take; a pattern thus formed is called a 'cept'). Ception is a bodily form of conceiving, i.e., of conceptually structuring content to be articulated in speech: this content-to-be-made-sense-of is **grasped** by an abstract prehensile action (the grasp occurring 'in the air').

The notions of ceiving/ception and cept that are introduced here are predicated upon a view of thinking as an activity not of the mind or brain but of the entire person, involving the body and its cultural skills in relevant ways, and of grasping by hand and other modes of handling objects as primary human forms of exploring, recognizing, and understanding the world, activities which provide numerous models after which linguistic concepts are formed, including the concept 'concept' itself, which depicts the process of making-sense-of (conceiving) as 'taking-hold-of-together,' i.e., as action by the hands. In ception, thinking-for-speaking draws upon the intelligence and world-knowledge of the hands. In contrast to depiction, during which the speaker **controls** the

activity of the hands, during ception the speaker is **dependent on** his or her body to 'come up with' an appropriate cept: the process of speaking becomes dependent upon embodied knowledge. Thus, when we observe speakers forming cepts while speaking, we witness the very process of embodied thought. Cepts, of course, are also formed and used during acts of depiction, in which case they depict phenomena in terms of ways of grasping or handling them. And many pragmatic gestures – metaphorical ones – are ceivings and articulate the process of communication as a handling of things (*see* **Pragmatic Acts**).

The extent to which speakers rely on 'pure' ceiving (i.e. ceptional acticvity of the hands performed outside the realm of conscious awareness and without specific depictive aims) to aid them in the formulating of talk and the making of sense appears to vary greatly. When the activity occurs, however, it is easily recognized: it involves the speaker orienting to the interlocutor, not to the gesture (ceiving is a background process), and performing largely haptic motions whose gestalt often coincides with subsequently uttered concepts. When interlocutors see the speaker actively searching for a concept (i.e., a word), they may volunteer one that fits the cept that the speaker has presented. In other words, listeners have privileged access to the speaker's gestured cepts (which is *not* the case during depiction).

Pragmatic Function and Placement of Gestures

Word searches demonstrate the importance that the relative ordering of gesture and speech has for the process of intersubjective understanding: during ception, manually performed cepts usually precede verbally articulated concepts. The hands are given an opportunity to find the first form that makes sense. Interlocutors are thereby afforded previews of concepts, enabling them to build understanding incrementally. Within the context of the other alignment frameworks, relative ordering of gesture and talk is organized differently and meets different tasks. When gesture is engaged with the world-at-hand, talk is often subservient to and made to fit the manual-visual procedures by which the scene is illuminated and its perception shaped. Pointing is coordinated with specific classes of linguistic expressions (deictics and demonstratives) (*see* **Deixis and Anaphora: Pragmatic Approaches**). During depiction special linguistic expressions and gaze direction are used to direct the recipient's visual attention to the gesture; gaze, talk, and gesture are orchestrated with great precision to render multimodal representations of worlds beyond the interaction space. Embodiments of communicative action, in contrast, and many other-directed, interactive, or transactional gestures are background processes, perceived peripherally (by listeners) or kinesthetically (by speakers), and providing an ongoing interactional framing and footing of the talk that occupies the focus of attention. Very important for the functions of pragmatic and interactional gestures, on the other hand, is their exact placement within the turns and sequences of interaction within which they occur (*see* **Conversation Analysis**). Gestures made just prior to or during the initiation of an utterance can foreshadow the speech act for which the turn is taken; ongoing gesticulation in mid-turn can mark the continuing relevance of the speech act frame of the turn, or the performance of a series of such acts, for example during extended turns at talk; and gestures made during or after utterance completion can indicate the kind of response that is sought for it, or the stance that the speaker takes with respect to what is conveyed (as is the case with shrugs, which are common during utterance completion).

All gesturing of the hands is co-orchestrated with speech prosody: gesture units coincide with prosodic units, and gesture strokes are coordinated with prosodic stress. In some specialized varieties (the gestures of rappers and conductors, for example), but also sometimes during ordinary conversation, gestural motions appear to map out the movement of the voice, thereby visualizing acoustic phenomena. To some extent, this coordination is a by-product of the self-synchrony of the human body: muscular actions of the limbs synchronize with muscular action of the vocal apparatus. At times, however, the hand's dancing to the vocal beat is a more deliberate practice of revealing the ongoing organization of speech, offering the recipient hand-packaged 'chunks' of talk by providing coherence via rhythmically placed iterations of a gestural act.

Ghana: Language Situation

M E Kropp Dakubu, University of Ghana, Legon, Accra, Ghana

© 2006 Elsevier Ltd. All rights reserved.

General Characteristics

Ghana is on the coast of West Africa, 7° north of the equator. Its total population is approximately 18 000 000, according to the 2000 census. The official language of the country is English, but all its immediate neighbors, Togo to the east, Ivory Coast to the west, and Burkina Faso to the north, are officially Francophone. There are approximately 50 indigenous languages, i.e., languages spoken by those who can claim a historical homeland within Ghana. Akan is the most widely spoken language, but no single language is the first language of a majority of the population.

Multilingualism

English is the official language of government and education, but not every Ghanaian speaks it. Most children, especially in the most rural areas, hear English only in school. Virtually all Ghanaians speak one or more indigenous languages, and bilingualism is very common; in urban areas, many people, especially those who come from other parts of the country, speak four or more languages. Anyone who has been to school speaks at least one Ghanaian language, and English at least to a degree. Many people speak Akan in addition to their own language.

Another widely spoken second language is Hausa, especially among people from northern Ghana and beyond who have migrated into urban centers. Hausa was first introduced into the country by trading caravans coming from the north of present-day Benin and Nigeria, and owes its present position as a lingua franca to its use by the colonial police and army, whose members were recruited largely from northern Ghana and regions to the east, where Hausa was already commonly spoken.

Language in Education

The Ghanaian policy on language in education has vacillated between requiring English as the only

Ghana: Language Situation

M E Kropp Dakubu, University of Ghana, Legon, Accra, Ghana

© 2006 Elsevier Ltd. All rights reserved.

General Characteristics

Ghana is on the coast of West Africa, 7° north of the equator. Its total population is approximately 18 000 000, according to the 2000 census. The official language of the country is English, but all its immediate neighbors, Togo to the east, Ivory Coast to the west, and Burkina Faso to the north, are officially Francophone. There are approximately 50 indigenous languages, i.e., languages spoken by those who can claim a historical homeland within Ghana. Akan is the most widely spoken language, but no single language is the first language of a majority of the population.

Multilingualism

English is the official language of government and education, but not every Ghanaian speaks it. Most children, especially in the most rural areas, hear English only in school. Virtually all Ghanaians speak one or more indigenous languages, and bilingualism is very common; in urban areas, many people, especially those who come from other parts of the country, speak four or more languages. Anyone who has been to school speaks at least one Ghanaian language, and English at least to a degree. Many people speak Akan in addition to their own language.

Another widely spoken second language is Hausa, especially among people from northern Ghana and beyond who have migrated into urban centers. Hausa was first introduced into the country by trading caravans coming from the north of present-day Benin and Nigeria, and owes its present position as a lingua franca to its use by the colonial police and army, whose members were recruited largely from northern Ghana and regions to the east, where Hausa was already commonly spoken.

Language in Education

The Ghanaian policy on language in education has vacillated between requiring English as the only

medium of instruction at all stages and allowing instruction in all subjects in the local language (or the main language of the region, in the case of the less widely spoken languages) for the first 3 years of primary school. The latter was the policy for many years, but the Ministry of Education adopted an English-only policy in 2002. Ghanaian languages are still taught as subjects. After primary school, they are optional at all levels, including university level. Most adult literacy programs teach a local language, not English. These programs are conducted both by the Ministry of Education and by private institutions.

Language and the Media

Print

There is an active industry based on publishing in English. Publishing in Ghanaian languages, in comparison, is a small industry, consisting mainly of producing materials for educational and religious (Christian) use.

Electronic

Until the early 1990s, radio and television were government monopolies. Broadcasting was mainly in English, although selected Ghanaian languages were given weekly slots, for news and occasionally for drama. With the liberalization of media policy, many FM radio stations appeared; these broadcasters quickly adopted phone-in talk show formats that allowed or even encouraged use of Ghanaian languages. Today, virtually every major center has at least one FM station, and many broadcast mainly or even entirely in a Ghanaian language. Television broadcasting is still concentrated in Accra, the capital and largest city. Most television programming continues to be in English, with relatively few slots for news and drama in selected Ghanaian languages.

Indigenous Language Groups

The people in the forest and coastal savannah south and the savannah north differ linguistically and culturally. Ghanaians in the northern third of the country speak mainly languages of the Central Gur group, whereas people in the southern two-thirds speak languages that are grouped under the label 'Kwa'. Two Mande languages are also spoken in Ghana: Bisa (with about 137 740 speakers) is spoken in the far northeast and Ligby is spoken near the Ivory Coast border. In the following list, languages are grouped roughly according to closeness of relationship. Figures for numbers of speakers (where available, given in parentheses) are based on data in the 2000 Ghana Census report:

South

Group A

Akan (7 438 867) (language of the capitals of the Brong-Ahafo, Ashanti, Western, Central, and Eastern Regions).

Nzema (207 474), Ahanta (253 415), Aowin (109 946), Sehwi (211 334) (all spoken in the Western Region), Anufo (63 910) (Northern Region).

Guang languages: Gonja (211 703; spoken north of the others), Gichode, Dwang, Yeji, Nchummuru, Krachi (113 334 speakers for the last three combined), Nkonya (25 599), Okere, Larteh, Anum (156 890 for all three), Awutu, Efutu (108 723 for both).

Group B (languages of the Accra Plain)

Ga (587 412; the traditional language of the capital Accra), Dangme (799 805).

Group C

Ewe, the main language of the southern Volta Region (2 212 113).

Group D (several highly differentiated languages spoken in the central Volta Region)

Adele, Lelemi-Lefana, Siwu, Likpe (71 535 speakers of the last two combined), Santrokofi, Logba, Bowuli, Avatime, Nyangbo, Tafi (29 343 speakers for the last three), Kposo, Animere.

North

Group A

Frafra (426 029; the language of Bolgatanga, capital of the Upper East), Wali (173 536; in and near Wa, capital of the Upper West), Dagaare (641 926), Birifor, Safaliba (7 827), Buli (118 709), Konni, Nabt, Talni, Kusaal (378 007), Dagbani (746 924; the language of Tamale, capital of the Northern Region), Mampruli (200 393), Nanuni (78 812), Hanga.

Group B

Bimoba (113 130), Konkomba (474 293), Basaare (51 299), all spoken near the border with Togo.

Group C

Kasem (116 141), Sisaala (165 535), Chakali, Tampulma, Vagla (41 684), Deg (55 174), Delo.

Gibraltar: Language Situation

D Levey, Universidad de Cádiz, Cádiz, Spain

© 2006 Elsevier Ltd. All rights reserved.

Measuring just 6 km^2 and stretching 4.8 km from north to south, Gibraltar, or 'the Rock,' as it is popularly known, is a small British colony with a population of just under 30 000 (see **Figure 1**). Situated on the Iberian Peninsula, it has remained a bone of contention between Spanish and British governments ever since it was seized by the Anglo-Dutch fleet during the War of the Spanish Succession (1702–1713).

After the occupation in 1704, most of the original Spanish inhabitants left and a new population emerged, of mainly Genoese and Jewish origin. After the signing of the Treaty of Utrecht (1713), which officially ceded Gibraltar to the British Crown, the population grew rapidly, with immigrants arriving from Italy, Malta, Morocco, Catalonia, Minorca, Portugal, and France. The colony's rich, multicultural makeup is reflected in the local lexicon, which contains several Italian, Arabic, and Hebrew borrowings. Today Gibraltar remains a multiracial society that is home to significant Jewish, Moroccan, and Indian communities.

Although English has been the official language of Gibraltar for three centuries and the small colony boasts the second oldest English-language newspaper in Europe, *The Gibraltar Chronicle* (founded 1801), Spanish has, until fairly recently, at least, remained the lingua franca. Indeed, well into the 20th century the majority of Gibraltarians spoke little if any English, and it was only really after World War II that concerted efforts were made to encourage the use of English. This was largely achieved through the implementation of a new education system, which mirrored that of mainland Britain and which made English the sole language of instruction in local schools.

Although most Gibraltarians today can communicate effectively in both Spanish and English, independently or simultaneously, language choice is often subject to context and situation. Though English enjoys prestige status and may be used in more formal contexts, Spanish or the code switching local variant known as 'Yanito' is still dominant in everyday situations and in the home domain, particularly among older speakers. Recent research, however, suggests that the situation may be changing. Whereas parents and grandparents tend to use Spanish and Yanito when speaking to each other at home, English is encouraged, when possible, among younger family members. Although in some cases youngsters may revert to Spanish or Yanito outside carer-orientated networks, the new generation of Gibraltarians, particularly those from educated middle-class backgrounds, appears to be using English as a spontaneous language choice far more than their predecessors did.

A pragmatic attitude toward the use of language generally prevails on the Rock, and locals will accommodate to the linguistic strengths and preferences of their interlocutors. However, inevitably, in some cases, language choice may be interpreted as a political statement. For some, being British yet speaking Spanish is not necessarily incompatible, whereas for others, language use may be seen as a reflection of national identity. In a colony that strongly defends its British status and vehemently opposes any moves toward devolution, being heard as well as seen to be British may be a statement of allegiance.

Figure 1 Gibraltar is a British colony located on the southern tip of the Iberian Peninsula, at the entrance of the Mediterranean; it is connected to the neighboring Spanish town of La Linea de la Concepción by a narrow isthmus. Measuring less than 5 km from north to south and made up largely of precipitous rock and cliffs, habitable space in Gibraltar is limited and housing is a considerable problem for the local population of 28 500.

Gikuyu

C Githiora, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Gĩkũyũ (alternate names: Kikuyu, Gikuyu) is spoken as a first language by about one-third of Kenya's population, or about 10 million people. The speakers are known as the Agĩkũyũ (singular Mũgĩkũyũ) and they refer to their language as Gĩgĩkũyũ. The geographical dialects of Gĩkũyũ correspond to four administrative districts, which are Mt. Kenya (Kĩrĩnyaga), Northern (Nyĩrĩ), Central (Mũrang'a), and Southern (Kĩambu), but there is minimal differentiation among them. Gĩkũyũ is classified as a Thagicu language (Guthrie's zone E51) of the Central Northern Bantu family, and ultimately the Niger-Congo superfamily. Gĩkũyũ has borrowed significantly from Maasai (Purko and Ukwavi dialects), Swahili, and English. Gĩkũyũ is one of Kenya's most thriving languages with a vibrant presence in mass media and publications. It is broadcast on a number of community radio stations, and on national radio, KBC. Pamphlets, journals, and magazines are published regularly in this language, and books written in Gĩkũyũ are published each year in Kenya and abroad. The renowned writers Ngugi wa Thiong'o and Gakaara Wanjau maintain the language's international visibility by publishing major literary works in Gĩkũyũ. A standardized orthography was first published by the United Kikuyu Language Committee (UKLC) in 1947. It was revised and updated by UKLC's successor, UUGI (Ùũrũmwe na ũkũria wa Gĩgĩkũyũ) in 1984 and 2002. Two significant studies on the language have been done by Barlow (1960) and Armstrong (1967), and two grammar sketches by Gecaga (1953) and Mugane (1997). A Kikuyu-English dictionary by Benson (1964) is still in print.

Phonology

Gĩkũyũ is a tone language, where the syllable is the tone-bearing unit. In autosegmental terms, the syllable is the licenser of tone, i.e., it assigns one tone per syllable, regardless of its length (weight). These tones, however, are not marked in standard Gĩkũyũ orthography.

Gĩkũyũ has three levels of tone: high (H), mid (M) and low (L), as illustrated in the following examples: *gĩthiitũ* (MHL) 'charm', *mũthũngũ* (MHL) 'European person', *ikuua* (LLM) 'load', *njingiri* (HMH) 'musical rattles'.

Lexical tone in Gĩkũyũ changes the meaning of words: for example, *aka* (HH) 'build' vs. *aka* (MM) 'wives'; *iria* (HHM) 'sea' vs. *iria* (MML) 'milk'; *ira* (ML) 'yesterday' vs. *ira* (LM) 'snow'. Grammatical tone changes sentence or phrase meaning: for example, *nĩmaakaga* (MMHL) (habitual tense) 'they build'; *nĩmaakaga* (HMML) (past habitual) 'they used to build'.

Syllables are always open, minimally consisting of a vowel (V) or a consonant-vowel (CV) sequence, and there are heavy and light syllables. Examples: V *o* 'they'; VV ***ooki*** 'newcomers, immigrants'; CVV ***tĩĩrĩ*** 'soil'; CV *ke* 'take', *ma* 'truth', *ha?* 'where?'; NCwV *ngwa* 'thunder'; NCyV *ndya* 'feast'; NCV *nda* 'stomach'.

Vowels

Gĩkũyũ has seven vowels: **a**, **e**, **i**, **ĩ**, **o**, **u**, **ũ**. There is contrastive vowel length so each vowel can be either long or short: for example, *tata* 'drip'/*taata*

Introduction

Gĩkũyũ (alternate names: Kikuyu, Gikuyu) is spoken as a first language by about one-third of Kenya's population, or about 10 million people. The speakers are known as the Agĩkũyũ (singular Mũgĩkũyũ) and they refer to their language as Gĩgĩkũyũ. The geographical dialects of Gĩkũyũ correspond to four administrative districts, which are Mt. Kenya (Kĩrĩnyaga), Northern (Nyĩrĩ), Central (Mũrang'a), and Southern (Kĩambu), but there is minimal differentiation among them. Gĩkũyũ is classified as a Thagicu language (Guthrie's zone E51) of the Central Northern Bantu family, and ultimately the Niger-Congo superfamily. Gĩkũyũ has borrowed significantly from Maasai (Purko and Ukwavi dialects), Swahili, and English. Gĩkũyũ is one of Kenya's most thriving languages with a vibrant presence in mass media and publications. It is broadcast on a number of community radio stations, and on national radio, KBC. Pamphlets, journals, and magazines are published regularly in this language, and books written in Gĩkũyũ are published each year in Kenya and abroad. The renowned writers Ngugi wa Thiong'o and Gakaara Wanjau maintain the language's international visibility by publishing major literary works in Gĩkũyũ. A standardized orthography was first published by the United Kikuyu Language Committee (UKLC) in 1947. It was revised and updated by UKLC's successor, UUGI (Ùũrũmwe na ũkũria wa Gĩgĩkũyũ) in 1984 and 2002. Two significant studies on the language have been done by Barlow (1960) and Armstrong (1967), and two grammar sketches by Gecaga (1953) and Mugane (1997). A Kikuyu-English dictionary by Benson (1964) is still in print.

Phonology

Gĩkũyũ is a tone language, where the syllable is the tone-bearing unit. In autosegmental terms, the syllable is the licenser of tone, i.e., it assigns one tone per syllable, regardless of its length (weight). These tones, however, are not marked in standard Gĩkũyũ orthography.

Gĩkũyũ has three levels of tone: high (H), mid (M) and low (L), as illustrated in the following examples: *gĩthiitũ* (MHL) 'charm', *mũthũngũ* (MHL) 'European person', *ikuua* (LLM) 'load', *njingiri* (HMH) 'musical rattles'.

Lexical tone in Gĩkũyũ changes the meaning of words: for example, *aka* (HH) 'build' vs. *aka* (MM) 'wives'; *iria* (HHM) 'sea' vs. *iria* (MML) 'milk'; *ira* (ML) 'yesterday' vs. *ira* (LM) 'snow'. Grammatical tone changes sentence or phrase meaning: for example, *nĩmaakaga* (MMHL) (habitual tense) 'they build'; *nĩmaakaga* (HMML) (past habitual) 'they used to build'.

Syllables are always open, minimally consisting of a vowel (V) or a consonant-vowel (CV) sequence, and there are heavy and light syllables. Examples: V *o* 'they'; VV ***ooki*** 'newcomers, immigrants'; CVV ***tĩĩrĩ*** 'soil'; CV *ke* 'take', *ma* 'truth', *ha?* 'where?'; NCwV *ngwa* 'thunder'; NCyV *ndya* 'feast'; NCV *nda* 'stomach'.

Vowels

Gĩkũyũ has seven vowels: **a**, **e**, **i**, **ĩ**, **o**, **u**, **ũ**. There is contrastive vowel length so each vowel can be either long or short: for example, *tata* 'drip'/*taata*

'aunt'; *kana* 'or'/*kaana* 'child'; *kara* 'etch'/*kaara* 'little finger'. At the phonemic level, the two high vowels **ĩ** and **ũ** are more centralized than the cardinals, **i** and **u** respectively. Examples: ***i**ra* 'yesterday'/ *ĩra* 'tell'; ***u**ga* 'say'/*ũra* 'run away'. Derived vowels, both long and short, are numerous in the language. The most common ones result from assimilation across morpheme boundaries, and reduplication of certain stems also induces V-length. Examples: *Gith**io**ra ũkĩra* → *Gĩth**io**r**oo**kĩra* 'Githiora, wake up'; *hit**i** **i**gĩrĩ* → *hit**ii**gĩrĩ* 'two hyenas'; *anak**e** **e**rĩ* → *anak**ee**rĩ* 'two warriors'; ***te*** 'discard' → ***teeateea*** 'waste'; *rĩa* 'eat' → *rĩĩarĩĩa* 'pick at food'; ***a**ria* 'talk' → *a**raa**ria* 'talk a bit'.

Diphthongs and triphthongs can also occur within stem boundaries, in normal speech, e.g., *k**ũi**na* 'sing', *k**iu**ga* 'half calabash', or across phrase/morpheme boundaries, e.g., *kĩmwĩr**eo**ke* 'then tell him/her to come', *mbũk**ũi**kumi* 'ten rabbits', *rek**eam**b**eoi**me* 'let him/her come out first'.

The glides **y**, **w** result predominantly from vowel sequences across morpheme boundaries, whereby **ĩ** becomes **y** and **ũ** becomes **w**, as the following examples illustrate: *kĩ-ũria* → *k**yũ**ria* 'question'; *ũ-othe* → *w**o**the* 'all'; *ũ-athani* → *w**a**thani* 'reign'. The high cardinal vowels **i** and **u** do not produce glides.

Consonants

Gĩkũyũ's inventory is made up of the following consonants:

nasals:	**n m ny ng'**
glides:	**w y r** (voiced alveolar flap)
stops:	**t k**
fricatives:	**th c h b g**

As in most Bantu languages, prenasalized consonants, **nd**, **mb**, **ny**, **ng'**, **ng**, **nj**, occur very frequently in Gĩkũyũ. Sometimes they occur as derived segments: for example, when an N-morpheme (prefix) comes into contact with an obstruent, it must produce a nasal consonant, as in the following examples involving the 1st person singular subject prefix N-: *rega* 'refuse' → ***nd**ega* 'refuse me'; ***k**ora* 'find' → ***ng**ora* 'find me'; *tũma* 'send' → ***ndũ**ma* 'send me'; *cuna* 'lick' → ***nj**una* 'lick me', etc.

Noun Classes

Gĩkũyũ is no exception to the chief characteristic feature of Bantu languages, namely the grouping of nouns into noun classes (see Table 1). These are based primarily on concordial properties, but there are discernible semantic relationships among members of each noun group.

The Concord System and Morphosyntax

The classification of nouns into these groups has important bearing on the language's grammar. Adjectives must agree with the number (singular or plural) and class of the head noun, somewhat like the behavior of the gender system in Romance languages. The noun also must be mapped onto the verb phrase by use of a 'marker' or prefix whose form is determined by the noun's class. In the illustrating examples in Table 2, the head noun is underlined, and its concordial prefixes highlighted in bold.

When coordinate phrases involve head nouns that belong to different classes, it becomes necessary to resolve the clash of subject concords. Two strategies are possible in such cases. One strategy opts for use of the human subject plural marker for final agreement or concord on the verb phrase, irrespective of the order of the coordinating clauses, e.g., *mwarimũ* (*a-/**ma**-) na huria* (*ĩ-/**i**-) **ma**gĩcemania* 'the teacher and the rhino met'; *huria na mwarimũ **ma**gĩcemania njĩra* 'the rhino and the teacher met'. The second strategy takes advantage of the plural subject prefix of inanimate, nonhuman nouns of the **kĩ-/i-/ci**-noun group, e.g., *muti (ũ-/ĩ-) na karamu* (***ga-/tũ-**) **ci**kiunika* 'stick and pen broke'.

Table 1 Gĩkũyũ noun classes

Noun prefix singular/plural	*Examples*	*General semantic content*
mũ-/a-	**mũ**ndũ, **mũ**rĩmi, **mw**arimũ	human; kinships; professionals
mũ-/mĩ-	**mũ**tĩ, **mũ**barĩki, **mũ**tũng'ũ	trees, plants; diseases; parts of body
i-/ma-	**i**buku, **i**niũrũ, **i**gongona, **i**ruga	inanimates; parts of the body; ceremony
kĩ-/i-/ci-	**Kĩ**mbaruuhia, **Gĩ**thweri, **gĩ**thiitũ	ceremonial, religious objects; liquids; languages
ø-/ø-	thonjo, thigiriri, ngi, ndutuura, huria, njogu	birds, insects, animals
rũ-	**rũ**ũĩ, **rũ**nyeki	long objects
ka-/tũ-	**ka**mũndũ, **ga**tu, **ka**nyũmba	diminutives
ũ-/ũ-	**ũ**thaka, **ũ**coorua, **w**agi; **ũ**cũrũ	abstracts; miscellaneous
ku-/ø	**kũ**gura; **gũ**thambia, **kũ**iya	verbal nouns; miscellaneous
ha-/ø; kũ-/ø	**ha**aha, **kw**ene, **kw**ao	locatives

Table 2 Examples of concord in Gĩkũyũ

Singular	*Plural*	*Gloss (in plural)*
mũndũ ũyũ **mũ**kuhĩ nĩ **a**rathoma ibuku	**andũ** aya **a**niini nĩ **ma**rathooma mabuku	'these short people are reading books'
kamũndũ gaaka **ga**kuhĩ **ka**rathooma ibuku	**tũmũndũ tũ**ũtũ **tũ**rkuhĩ **tu**rathooma mabuku	'these (dim.) small people are reading books'
riitho rĩake **rĩ**nene **rĩ**rona wega mũno	**maitho ma**ake **ma**nene **ma**roona wega muno	'his/her big eyes are seeing very well'
ibuku rĩakwa **rĩ**kuru **ri**rorĩire kũu	**mabuku ma**kwa **ma**kũrũ **ma**rorĩire kũu	'my old books got lost there'

Word Order in Gĩkũyũ: Subject-Verb-Object (SVO)

The chief elements of the verb phrase or sentence occur according to the following template:

nĩ (focus) + SM + TAM + (*kĩ*) + (OM) + (RF) + stem + FV (O)

RF = reflexive marker which may alternately occupy object marker position (OM). FV stands for final vowel and O for object. The latter is actually outside the main template, but is necessary for a fully formed sentence.

For example:

Kamau	nĩ-ari-ngi-re	mũbiira
Kamau	FOC-hit-TAM-FV	*the.ball*
'Kamau hit the ball'		
S	V	O

Verb morphology is very rich in an agglutinating language such as Gĩkũyũ. Derivation in the verb system, for example, is a highly productive process involving the use of extensions (infixes) inserted before the final vowel to create additional senses or meaning to the base verb. These are highlighted in bold in the following examples:

-ia/-thia (causative) e.g., *koma* 'sleep' → *komia/komithia* 'make sleep'
-ĩra/-era (applicative/prepositional) e.g., *thooma* 'read' → *-thoomera* 'read for/to'
-ũra (reversive) e.g.,*-hinga* 'close' → *-hingũra* 'open'
-ĩka/-eka (stative) e.g., *hingĩka* 'be closed', *thoomeka* 'readable'
-ana (reciprocal) e.g., *enda* 'like, love' → *-endana* 'love each other'
-anga (diffusive) e.g., *ita* 'pour' → *itanga* 'pour all over'.

A verb may have more than one extension in a single sequence, e.g., *hinga* 'close' → *hingũra* 'open' → *hingurithia* 'cause to open' → *hingũrithania* 'cause each other to open', etc.

Doubling the verb stem or reduplication diminishes the force of the action expressed by the verb. It also indicates repetition, e.g., *rũma* 'bite' → *rũmarũma* 'nibble/mince'; *rekia* 'let go' → *rekarekia* 'let go little by little'. In the case of verb stems consisting of more than two syllables, only the first two are repeated, e.g., *hingũra* 'open' → *hingahingũra* 'open a little'; *tindĩka* 'push' → *tindatindĩka* 'push a little'.

For negation, the marker *-ti-* is inserted in the verb phrase, immediately after the subject marker, e.g., *tũtigaathiĩ naak*e 'we will not go with him/her'. However, the negative form in subordinate phrases is marked with *-ta-*, e.g., *tũgaathiĩ tũtarĩ naake* 'we shall go without him/her'.

Tense and Aspect Marking

The tense-aspect system is very complex in Gĩkũyũ. Tense combines with aspect to produce a wide variety of temporal notions, in the order of TS-VB-AS-FV. (TS (tense); VB (verb); AS (aspect); FV (final vowel) which may differ according to aspect of the verb phrase). There are 9 major tenses, whose markers are highlighted in bold below:

-ra-: present progressive, current, e.g., *nĩarathooma*
ø/-ra-: current past (within a day), e.g., *nĩathoomire*
-a-: near past, e.g., *nĩathoomire*
-raa-: remote past, e.g., *nĩaraathomire*
-aa-: current past/future (within a day), e.g., *nĩagathooma*
-kũ-: near future (within the next few days), e.g., *nĩekũrĩthooma*
-rĩĩ-: remote future, e.g., *nĩndĩrĩthooma*
-ka-: present consecutive, e.g., *nĩagaathooma*
-kĩ-:parallel, e.g., *nĩekũgĩthooma*

There are three aspect markers, which are **-ag-** (stative/imperative/subjunctive), **-ĩĩt-** (perfect), and **-ir-** (completive). Twenty-seven combinations are possible in theory, but only about 20 are clearly attested in the language because some combinations are constrained by semantic considerations.

Nominal Derivation

Two broad types of noun can be distinguished in Gĩkũyũ. The first type consisting of a basic noun and its prefix only. This type of noun is not further divisible, e.g., *irigũ* 'banana', *mũcinga* 'gun', *kĩrĩma* 'mountain'. Like the others, these nouns can derive postpositional phrases using the locative suffix, *-inĩ*,

e.g., *irigũ**inĩ*** 'in the banana', *mũcinga**inĩ*** 'on/in the gun', *kĩrĩma**inĩ*** 'on/at the mountain', etc.

Derived nouns in Gĩkũyũ are easily and creatively generated by use of prefixation and/or suffixation. The former consists of such prefixes as: the diminutive prefixes *ka-/ga-/tũ-*, e.g., ***ka**mũici* 'little thief', ***tũ**mũndũ* 'little people'; the augmentative prefix *kĩ-*, e.g., ***kĩ**mũici* 'big thief', ***kĩ**mũndũ* 'big (gigantic) person'; and the collective class prefix *ma-*, e.g., ***ma**mũici* 'group of big thieves'.

Deverbal nouns are distinct in that they are formed through both prefixation and suffixation using the formula *mũ* + verb + ***i***, e.g., ***mũ**tegi* 'trapper' ← *tega* 'trap'; ***mw**aniki* 'dryer' ← *anĩka* 'put to dry'; ***mũ**korori* 'cougher' ← *korora* 'cough'. Verbs can also function as simple verbal nouns, e.g. *gũũka gwake ti kwega* 'his coming is not good', *kwaria kũũ nĩ kũũru* 'that talk is bad'.

Compound nouns are many in Gĩkũyũ, and two very significant words in the speakers' cosmology are nouns of this category, that is, *Mwene* + *Nyaga* 'Owner of Majesty [God]', who habitually graces *Kĩrĩ* + *Nyaga* 'Mountain of Majesty' or Mt. Kenya. Other such nouns include *mwaki* + *nyũmba* 'house-builder' and *mutua* + *uhoro* 'arbiter'. Other complex nominals involve use of the associative marker *-a*, e.g., *mwaki **wa** nyũmba* 'builder of houses'; *nyũmba **ya** toro* 'sleeping room [bedroom]'.

There are a large number of nominal derivations, creating nouns each expressing a unique meaning which is determined by the semantic argument. Such thematic roles include agent, patient, manner, result, occasion, or locative. For example, agent nominalization is very productive. It involves a nominalizing suffix *-i*, and an appropriate noun class prefix. A number of proper names of Agĩkũyũ are thus derived, e.g., *Mwaniki* 'one who cures skins' or *Mũrĩithi* 'one who herds'. The agent type of nominalization is also the source of many synthetic compounds such as *mũenda-andũ* 'a person who is kind to people'. Patient nominalization involves transitive verb stems with the suffix *-o* to describe 'the act of,' e.g., *mwiĩr**o*** 'telling oneself, self-deception', while reflexive *-ĩ-* can be added to the stem, e.g.*mwĩend**o*** 'state of liking oneself, selfishness'. Product nominalization uses the *mũ-* prefix or *kĩ-/gĩ-*, and the final vowel changes from *a* to *o*. Intransitive verbs mostly participate in this process, e.g., ***gĩ**caambio* 'defamation' ← *caambia* 'defame'; ***gĩ**thoomo* 'education' ← *thooma* 'read'; ***mw**andĩk**o*** 'handwriting' ← *andĩka* 'write'. Location-type nominalization involves the *i*-prefix for consonant-initial stems, and *rĩ-*for V-initial stems, e.g., ***i**kuuĩro* 'place of loading' ← *kuua* 'carry'; ***i**thũiro* 'sunset' ← *thũa* 'go down'. Nominalization of manner involves prefixation with *mũ-* and suffixation with *-ĩre*, e.g., ***mũ**kuu**ĩre*** 'manner of carrying' ← *kuua* 'carry'; ***mw**andĩk**ĩre*** 'writing style' ← *andĩka* 'write'. Occasion nominalization can occur with any verb type by prefixing with *i-* and leaving the final vowel unchanged. The resulting noun refers to occasions of an event specified by the verb stem, e.g., ***i**ceera* 'visit' ← *ceera* 'visit'; ***i**ruga* 'feast' ← *ruga* 'cook'.

Gilliéron, Jules (1854–1926)

W H Veith, Universität Mainz, Mainz, Germany

© 2006 Elsevier Ltd. All rights reserved.

Jules Gilliéron was born in La Neuveville, canton of Berne, Switzerland. He studied in Neuchâtel and Basle, Switzerland, and finally at the famous École pratique des Hautes Études, Paris, where he became a professor of dialectology [in the French system, 'maître de conférence'] in 1883. He acquired French citizenship in 1886.

Gilliéron was the founder of scientific dialectology in France. His first intensive experience with dialects was during a 3-week stay at a farm in the Roman

Valais, Switzerland, leading to a publication in 1880 in which he described—in today's terms—the phonology and morphology of the speakers of Vionnaz and its surrounding areas. This study was extended to a phonetic atlas of the Roman Valais (published in the same year). Following the suggestion of his Parisian teacher and friend Gaston Paris, he extended this small dialect atlas to a huge one covering the French dialects as a whole. The *Linguistic atlas of France (ALF)*, published in 1902–1910, was based on the data from 639 locations collected between 1897 and 1901 by Edmond Edmont, who, for this purpose, had invented a special phonetic alphabet.

The atlas was, indeed, Gilliéron's major achievement, but it also was permanently accompanied by the publication of explanatory notes and valuable monographs as interpretations of the maps. Gilliéron did not content himself with this basic research. At the same time that de Saussure gave his lectures in Geneva, Gilliéron was elaborating a structural approach to dialects in Paris. 'Dialect' was considered as a linguistic system with signs having an expression plane and a content plane. The description of dialects has to have a synchronic and an historical aspect. Gilliéron's theory on area-related linguistic change included both aspects in the description.

The synchronic lexical variation as shown on the maps must be explained historically. The replacement of one expression by another one may have two major reasons: (1) wear and tear of the expression (e.g., if only one phoneme remains), and (2) danger of homonymy/polysemy as a result of language change, jeopardizing communication. As early as 1880, while out of the way in the Roman Valais, Gilliéron had observed that the vitality of the speakers was the remedy for a wear-and-tear conflict. The words live in their and the speakers' surroundings ('linguistic biology'). The speakers are aware of a conflict. How the potential collision of homonyms was avoided is shown for an area in the southwest of France where two homonyms were the result of several sound changes (as such: *-us* > Ø, *c-* > *g-*, *-ll-* >*-t*): *gat*[1] meaning 'cock' (< Lat. *gallus*), *gat*[2] meaning 'cat' (< Lat. *cattus*). To keep communication working, *gat*[1] 'cock' was replaced in this area by other words (*see* **Dialects: Early European Studies**). The speakers individually take replacements from other language varieties, e.g., from standard French (*coq*) or from other stylistic levels (irony, e.g., *bigey* = 'village judge' for the cock on the muck heap early in the morning). Each word has its own history so that the linguist has to describe it individually. Not the entire word family is concerned with such changes if a danger of misunderstanding could be repaired on a lower level.

Gimson, Alfred Charles (1917–1985)

J C Wells, University College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

A. C. Gimson was the leading phonetician of British English in the second half of the 20th century. He is known throughout the world for his works on English pronunciation, particularly for the textbook *An introduction to the pronunciation of English*, which despite its unduly modest title is still the standard work on the subject. (Since his death it has been extensively revised and rewritten, first by Ramsaran and then by Cruttenden.)

As an undergraduate at University College London (UCL), Gimson gained first-class honors in French. It was at that time that he first came into contact with phonetics, through the classes in French phonetics conducted by Hélène Coustenoble, a lecturer in the Department of Phonetics headed by Professor Daniel Jones. This was in 1939, and upon graduation he was called up into the British army. There he acted as a forces liaison officer, first with the French and then with the Free Polish forces. By 1945 he held the rank of Major. As the war ended Jones intervened to get him an early discharge so that he could join his department as Lecturer in Phonetics.

Jones groomed Gimson as his successor. Upon Jones's retirement in 1949, Gimson took over from him as Secretary of the International Phonetic Association (IPA) and as Editor of its journal, the *Maître Phonétique*. In due course Gimson was to be responsible for transforming this journal (then written entirely in phonetic transcription, with the official parts always in French) into the *Journal of the International Phonetic Association*, written in ordinary spelling and with English as the official language. Later, he was elected President of the IPA.

In the 1950s, English phonetics was still dominated by Jones's approach. Valuable in its day, by then it was becoming dated. Gimson maintained Jones's emphasis on the importance of training in practical performance in producing and in recognizing sounds, but reinvigorated the phonetic theory and practice of English phonetics by propagating views deriving from contemporary American structuralist doctrine. This included such terminological innovations as *allophone* and the notational distinction between /phonemes/ and [allophones], two innovations that Jones, despite his great interest in phoneme theory, had never adopted. In addition, Gimson extended Jonesian ear-training exercises by including drills on minimal pairs, something now taken for granted.

When Gimson's *Introduction* first appeared in 1962, it was immediately accepted as the standard description of received pronunciation (RP), displacing Jones's own works from this role.

From 1946 until his retirement in 1983 Gimson remained at UCL. In 1966 he was appointed Professor of Phonetics, and in 1971, on the retirement of Dennis Fry he became Head of the newly amalgamated Department of Phonetics and Linguistics.

Unlike his earnest and perhaps excessively formal predecessor, Gimson had an easy, relaxed style of speaking and lecturing. In the 1960s he became popular as a broadcaster, made familiar to the British public through a series of brief talks on pronunciation he gave as part of the breakfast-time *Today* program on the BBC. But it is in the world of English as a foreign language (EFL) that Gibson's name is particularly well known. He made frequent overseas lecture tours at the invitation of the British Council, the Linguaphone Company, and local universities. His two textbooks, *English pronunciation practice* (1965, with G. F. Arnold) and *A practical course of English pronunciation: a perceptual approach* (1975), reflect his concern with the teaching of pronunciation in the EFL context.

Gimson's most enduring influence on EFL theory and practice is arguably in the matter of phonetic transcription. Although Jones had experimented with a number of different types of transcription for English (all within an IPA framework), his *English pronouncing dictionary* and other EFL-oriented works used a 'quantitative' notation in which vowel length was symbolized explicitly, but length-related quality differences only implicitly (thus *bead* biːd, *bid* bid, *caught* kɔːt, *cot* kɔt). By the 1960s this notation was facing serious competition in the 'qualitative' system used by Abercrombie and others, in which quality differences were explicitly shown and length marks not used (*bead* bid, *bid* bɪd, *caught* kɔt, *cot* kɒt). Gimson's 'quantitative-qualitative' system succeeded in achieving a synthesis of the two types, with both quantity and quality made explicit, even at the price of added redundancy (*bead* biːd, *bid* bɪd, *caught* kɔːt, *cot* kɒt). He popularized this notation first in his *Introduction* and then, crucially, in the 14th edition of Jones's *English pronouncing dictionary* (1977; Gimson had taken over the editorship in 1964). With minor variations, this notation has been virtually universally adopted in British-influenced phonetic usage.

In the UCL Department of Phonetics that Gimson took over, the main teaching load involved students of speech therapy, who were not actually registered for any university degree. Gimson played a major role in the reorganization of speech therapy education in Britain and the conversion of speech therapy (now called speech and language therapy) into an all-graduate profession. At UCL, with his departmental colleagues Adrian Fourcin and Evelyn Abberton, he was responsible for an arrangement whereby students of what became the National Hospital's College of Speech Sciences were registered for the B.Sc. as undergraduates of UCL. (Subsequently, the NHCSS actually became a part of UCL, as the Department of Human Communication Science, and its students now no longer have this roundabout mode of registration.) Under Jones, phonetics had been something of an orphan subject in university terms, taught only to occasional students and postgraduates; Gimson's legacy was a much stronger Department of Phonetics and Linguistics, with a large undergraduate body.

Gimson did not like people to call him by his first name. As a writer, broadcaster, or lecturer he was always just 'A. C. Gimson.' His friends and colleagues knew him as 'Gim' /gɪm/. It was only after his death that most of us discovered what his full name was.

In later life he suffered for some years from heart problems, which were treated with beta-blockers. He died unexpectedly of heart attack while mowing the lawn with an old-fashioned push-mower.

Givón, Talmy (b. 1936)

M Brdar, University of Osijek, Osijek, Croatia

© 2006 Elsevier Ltd. All rights reserved.

Interdisciplinarity is the keyword in describing the academic background of Talmy Givón, one of the major voices in the development of the functional/typological approach in linguistics. He received his B.S. in agriculture from the University of Jerusalem, and his M.S. in plant biochemistry at UCLA, where he also completed M.A. and Ph.D. in linguistics. After teaching for 12 years at UCLA, he moved in 1981 to the University of Oregon, Eugene, where he was Professor of Linguistics until his retirement.

Givón's research has at all times been rooted in functionalism. His own brand of functional approach may best be described as heterogeneous and eclectic. He has always been eager to point out the close parallel to biology; the human sociocultural organization and cognitive-intellectual-communicative tools are to be examined from an evolutionary perspective. His *Bio-linguistics* (2002) is an attempt to reconcile linguistic views with Darwinian evolution and natural selection, showing how language operates as an intermediary between complex biological design and adaptive behavior without subjecting the human species to unique biological laws.

His focus has not been so much on developing a functional *theory* as such, but rather on *doing* functional linguistics in the sense of providing language description (he is particularly fond of taking the cross-language perspective, including not only Indo-European languages, but also non-Western languages and especially minority languages), although he "does not shy away from generalizations and explanations" (Givón, 1984: 25). In fact, he rejects the term as "methodologically unsound and unscientific," claiming that the prior delimitation of the scope of the grammar and its formalization "bias one's perception of new facts and freeze one's explanatory intuition" (Givón, 1984: 25). The watershed between functionalist and formalist linguistic frameworks is in where explanations come from, and what counts as an explanation. While agreeing in general with functionalists, who reject the idea that formalism may constitute explanation per se, Givón stresses in the revised edition of *Syntax: a functional-typological introduction* (1984) the importance of core formal properties, thus striking a balance between formal aspects on the one hand and pragmatic and semantic ones on the other.

Another distinctive feature of Givón's functional approach is its emphasis on the cognitive aspects of human language activities. His recent work investigates the cognitive foundations of language use, including studies of chimpanzees' capacity for syntax.

While he stresses the structural aspects of functionalism, his work is a major departure from Saussurean structuralism. Essential ingredients of his approach are the notions that iconicity may supersede arbitrariness, and that synchrony and diachrony may merge (particularly obvious in his famous dictum that "today's morphology is yesterday's syntax," inflectional morphology being the fossilized syntax of earlier historical stages; Givón, 1971).

Under the name of Thomas Givón, he published in 1997 a critically acclaimed novel entitled *Running through the tall grass*.

Gimson did not like people to call him by his first name. As a writer, broadcaster, or lecturer he was always just 'A. C. Gimson.' His friends and colleagues knew him as 'Gim' /gɪm/. It was only after his death that most of us discovered what his full name was.

In later life he suffered for some years from heart problems, which were treated with beta-blockers. He died unexpectedly of heart attack while mowing the lawn with an old-fashioned push-mower.

Givón, Talmy (b. 1936)

M Brdar, University of Osijek, Osijek, Croatia

© 2006 Elsevier Ltd. All rights reserved.

Interdisciplinarity is the keyword in describing the academic background of Talmy Givón, one of the major voices in the development of the functional/typological approach in linguistics. He received his B.S. in agriculture from the University of Jerusalem, and his M.S. in plant biochemistry at UCLA, where he also completed M.A. and Ph.D. in linguistics. After teaching for 12 years at UCLA, he moved in 1981 to the University of Oregon, Eugene, where he was Professor of Linguistics until his retirement.

Givón's research has at all times been rooted in functionalism. His own brand of functional approach may best be described as heterogeneous and eclectic. He has always been eager to point out the close parallel to biology; the human sociocultural organization and cognitive-intellectual-communicative tools are to be examined from an evolutionary perspective. His *Bio-linguistics* (2002) is an attempt to reconcile linguistic views with Darwinian evolution and natural selection, showing how language operates as an intermediary between complex biological design and adaptive behavior without subjecting the human species to unique biological laws.

His focus has not been so much on developing a functional *theory* as such, but rather on *doing* functional linguistics in the sense of providing language description (he is particularly fond of taking the cross-language perspective, including not only Indo-European languages, but also non-Western languages and especially minority languages), although he "does not shy away from generalizations and explanations" (Givón, 1984: 25). In fact, he rejects the term as "methodologically unsound and unscientific," claiming that the prior delimitation of the scope of the grammar and its formalization "bias one's perception of new facts and freeze one's explanatory intuition" (Givón, 1984: 25). The watershed between functionalist and formalist linguistic frameworks is in where explanations come from, and what counts as an explanation. While agreeing in general with functionalists, who reject the idea that formalism may constitute explanation per se, Givón stresses in the revised edition of *Syntax: a functional-typological introduction* (1984) the importance of core formal properties, thus striking a balance between formal aspects on the one hand and pragmatic and semantic ones on the other.

Another distinctive feature of Givón's functional approach is its emphasis on the cognitive aspects of human language activities. His recent work investigates the cognitive foundations of language use, including studies of chimpanzees' capacity for syntax.

While he stresses the structural aspects of functionalism, his work is a major departure from Saussurean structuralism. Essential ingredients of his approach are the notions that iconicity may supersede arbitrariness, and that synchrony and diachrony may merge (particularly obvious in his famous dictum that "today's morphology is yesterday's syntax," inflectional morphology being the fossilized syntax of earlier historical stages; Givón, 1971).

Under the name of Thomas Givón, he published in 1997 a critically acclaimed novel entitled *Running through the tall grass*.

Glinz, Hans (b. 1913)

H Vater, University of Cologne, Cologne, Germany

© 2006 Elsevier Ltd. All rights reserved.

Hans Glinz was born on December 1, 1913, in St Gallen, Switzerland. From 1932 to 1936 he studied philosophy, history, German, and French at the universities of Zurich, Lausanne, and Paris (Sorbonne). In 1936 he completed his high school teacher exam (*Sekundarlehramtsprüfung*). In 1946 he took his Ph.D. exam and completed his *Habilitation* (postdoctoral dissertation) in 1949. From 1957 to 1965 he held a professorship at the pedagogical academy in Kettwig, and from 1965 until his retirement in 1979 he was full professor at the Institute of German Studies at the Technical University of Aachen. In 1962 he received the Konrad Duden award.

The areas treated by Glinz comprise theory of grammar, theory of text, grammar of German, contrastive linguistics, orthography, and didactics of linguistics. Glinz is one of the most outstanding authors in the realm of German and general linguistics, especially in the area of syntax. His dissertation on the history of the sentence constituents has been quoted frequently.

His most remarkable work is his book *Die innere Form des Deutschen,* in which he elaborated new methods for analyzing sentences, for example, permutation tests (*Umstellproben*) and deletion tests (*Weglassproben*). These resembled very much the immediate constituent analysis developed by American structuralists (e.g., Bloomfield, 1933; Pike, 1943; and Harris, 1951), whom he did not know at that time, as he confessed in the preface to the 4th edition (1965). However, the influence of the '*inhalt-bezogene Grammatik*' ('content-related grammar'; see Weisgerber, 1953–1954) can be felt too. Glinz introduced a new grammatical terminology (e.g., *Spannfügteil* for 'conjunction' and '*Fallfügteil*' for 'preposition').

Besides predominantly theoretical books such as *Die innere Form*, Glinz wrote such practically oriented books as grammars of German and course books for schools of higher education, some of them in cooperation with his wife Elly. His numerous articles concern various grammatical and didactic topics. He was honored with commemorative publications (see, e.g., the festschrift edited by Brinker & Sitta, 1973).

See also: Bloomfield, Leonard (1887–1949); Harris, James (1709–1780); Pike, Kenneth Lee (1912–2000).

A further important indication of Hjelmslev's growing reputation outside Denmark was the appearance in 1955 of Berthe Siertsema's *A study of glossematics: critical survey of its fundamental concepts* (2nd edn., 1965), a book that remains one of the most detailed and constructively critical treatments of Hjelmslev's theory.

Most of the large-scale works emanating from the movement at this time were general and theoretical in nature. One exception is the book published in 1951 by Knud Togeby (1918–74) entitled *Structure immanente de la langue française*: although set within the framework of a version of glossematic theory, it is a sustained treatment of the form and substance of French (see below 'The Procedure Exemplified', for more detail). Another extended treatment of a particular language (Spanish) in a glossematic framework, also published in 1951, was Emilio Alarcos Llorach's *Gramática estructural* (*según la escuela de Copenhague y con especial atención a la lengua española*).

Uldall completed his Part I of the projected *Outline of glossematics* (in page proof as early as 1952), but the divergence of their views meant that Hjelmslev found himself unable to write his Part II to fit with it. Part I was eventually published on its own in 1957, the year of Uldall's death. Between then and his own death in 1965, Hjelmslev produced no other large-scale works.

For a fuller historical account of the movement, see Fischer-Jørgensen (1975: ch. 7).

Logical Positivism and Glossematics

The following four characteristics of logical positivism exerted a strong influence on glossematics:

- Metaphysical sentences are not false but meaningless, and must therefore be avoided.
- Science must account for as many empirical facts as possible by means of logical deduction from as few axioms (initial assumptions) as possible.
- Structural statements are to be preferred to statements of content.
- Scientific language should be a kind of algebra, with all terms being unambiguously defined.

Avoidance of Metaphysical Claims

Traditionally, the glossematicians claimed, the view had been taken that methods appropriate for the humanities were quite different from those appropriate for the sciences. According to this traditional view, the basis for the difference was that the unpredictable 'human factor' was central in the study of the humanities, but missing from the sciences, in which all variables were controllable.

A refutation of this position was attempted in terms of an analogy: "If two candles on the dining-table do not burn exactly alike . . . it might, analogously, be inferred that the candle factor is too strong to permit physics and chemistry to be merely mechanical in operation" (Uldall, 1957: 2). Clearly the 'candle factor' could be made explicit in terms of structural differences in the candles, the influence of air currents, and other controllable physical and chemical aspects of the situation. So the issue was whether or not linguistics could attempt to make relevant aspects of the 'human factor' more explicit.

To account for linguistic phenomena in terms of this human factor (or 'mind,' 'world-view,' etc.) without further explanation would clearly be to use language in a metaphysical way, which the logical positivists would have found objectionable. This avoidance of metaphysical language makes an interesting comparison with the antimentalism of the linguistics of the same period in the USA (*see* **Phonology: Overview; Post-Bloomfieldians**).

Deductive Reasoning

'Inductive' reasoning argues from observed data to inferred theory. However, any theory that is arrived at by this method cannot be tested by the same method. Testing needs a different method, 'deductive' reasoning, which proceeds in the opposite direction from inductive reasoning.

Deductive reasoning in fact assumes a theory and on that basis predicts the kinds of data that will be observed; the validity of the assumed theory may be tested by comparing these predictions with the data that actually occur – if the predictions are at variance with the data, the theory is thereby shown to be false, while if the fit between predictions and data is good, the theory is thereby supported, though not shown incontrovertibly to be true.

It is clear that, in any type of scientific enquiry, both types of reasoning are needed. There is, however, an important difference between the two: inductive methods are a matter of trial-and-error, and so are difficult, if not impossible, to describe coherently – deductive methods are a matter of drawing conclusions from premises using well-defined logical processes.

Glossematicians certainly use the two terms 'inductive' and 'deductive,' but it is important to bear in mind that their usage does not conform exactly to the more usual explanation of the terms given here.

Importance of Structural Statements

There are some areas, for example color perception, where it is difficult to make a precise statement of

content (e.g., 'A sees this color as a shade of green tending towards turquoise'); it is often easier to achieve precision by making relational statements such as 'A sees colors X and Y as distinct from each other, whereas B sees X and Y as the same color.' This relational statement leaves out of account the 'greenness' or 'turquoiseness' or other specific property of colors X and Y.

Extension of this approach to aspects of language description was one of the key elements in the thought of Saussure. When dealing with the inner system of a language, it was for him much less important to ask 'What are the physical properties of this sound?,' than to ask 'Are these two sounds the same, or distinct?' The glossematicians took this approach to a conclusion judged by some scholars to be beyond the limits of feasibility.

Reduction of Scientific Language to an Algebra

Sentences using constructions of the kind that are typical of metaphysical discourse (such as 'the form of this utterance is governed by certain ideas present in the speaker's mind') should be excluded from scientific discourse; furthermore, all terms used should be defined unambiguously. Although suitable algebras were available to glossematics for its purpose, its proponents, notably Uldall, seem to have expended a good deal of energy in attempting to evolve an algebra of their own.

Form and Substance in Glossematics

Saussure viewed the structural system of a language as a form linking two kinds of substance: phonic (sounds) and conceptual (ideas). Both kinds of substance were described by him as formless masses ('*masses amorphes*'), one phonetic and the other semantic. The worlds of sound and idea can be conceptualized only by having form superimposed on them by the structural system of a language.

Although glossematicians also use the term 'substance,' they take it in a different sense – they view it, not as the formless masses themselves (to refer to which Hjelmslev uses a term translated into English as 'purport'), but as the *result* of operating on purport in terms of the abstract distinctions of which the 'form' consists. Thus form is logically prior to substance.

Form and Substance in the Area of Sounds

In the area of phonology and phonetics, for example, the purport is the whole range of possible sounds which the human vocal apparatus is capable of producing, i.e., the subject matter of general (language-independent) phonetics. On the other hand, the substance is the (comparatively restricted) range of sounds actually used by speakers of a language or language variety, i.e., the subject matter of language-specific phonetics.

Thus, for instance, the continuum formed by the pharynx, palate, teeth, and lips is a matter of general human anatomy; it is therefore language-independent and belongs to purport. However, this continuum will be divided up differently in different languages: the form of the particular language acts on the purport to produce the substance of that language.

Many languages will have a substance exhibiting a division of this particular continuum into three, giving a three-way distinction of place of articulation: a back [k]-area, a middle [t]-area, and a front [p]-area. In other languages, the continuum is divided into four parts: the [k]-area may be further divided (as in Eskimo – uvular consonants distinguished from velar), or the [t]-area may be further divided as in Hindi – retroflex consonants distinguished from dental).

From the point of view of the form of a language, the fact that the 'place of articulation' continuum is divided into three, or four (or in some languages more) is more important than what the three, or four (or more) places of articulation within the substance actually are.

Form and Substance in the Area of Ideas

Here one might take as an example of purport the infinite range of different color hues that exist. Each language specifies this infinite range in terms of a number of basic categories, most notably in the area of hue; some languages have a larger number of basic color terms than others.

Not only words are involved in form in this area: examples are very common in which prefixes or suffixes relate to each other formally in this way. Take, for instance, the aspect of purport represented by the (language-independent) continuum of time. On the level of form, many languages have a two-way distinction that, when applied to this continuum, often gives rise to a basic 'past' versus 'non-past' division on the level of substance, a division made manifest in two different sets of inflections.

Logical Priority of Form

Glossematicians recognize that form as well as purport is twofold, and that therefore substance is twofold; this yields four areas of study within every language:

- 'content-substance' (roughly meanings of words and of morphosyntactic properties of the language);

- 'content-form' (roughly morphological, syntactic, and lexical structure of the language);
- 'expression-form' (roughly phonology of the language);
- 'expression-substance' (roughly phonetics of the language).

Content and expression are on a footing of equality – each of them is presupposed by the other. On the other hand, form is logically prior to substance – there can be no substance unless form has done its work.

The conclusion drawn by glossematicians from this logical priority is that the scientific description of form must be entirely independent of substance, and, *a fortiori*, of purport. The science of the expression is thus not a phonetics, nor is the science of the content a semantics. Expression-form was claimed to be independent of phonetics, on the grounds that expression-form may be manifested not only in sounds (as in a spoken language) but also in, for example, writing, Morse code, or manual signs. For both expression and content, a language must be described in terms of its own 'immanent' structure.

Form: Discovery and Verification

Critics of glossematics often raised the objection: 'How can anything be discovered about form without reference to substance?' After all, the basic tool for investigating how languages work has to be to ask the question 'Does changing a sound in an utterance change its meaning, and vice versa?' Glossematicians certainly used this tool in the form of the so-called commutation test: in their terminology; 'Does a change on the level of the expression entail a change on the level of the content, and vice versa?'

The apparent paradox is resolved by noting that it is not on the level of discovery that substance must be excluded from consideration. The discovery phase of any scientific enterprise is inductive (see above 'Deductive Reasoning') in nature: the investigator must begin by examining observable data, which of course must involve physical properties of substance. He or she then proceeds to set up hypotheses about what must be the abstract formal system capable of accounting for the data.

The workings of this formal system, on the other hand, are deductive (see above 'Deductive Reasoning'); here the starting point is the hypothesized basic entities, the relations between them being stated formally, i.e., in terms which are not related to substance. As the deductive process continues, the elements concerned are put into correspondence with more and more properties of substance.

This is what Hjelmslev meant when he claimed (1961: 79) that glossematics "would be an algebra of language, operating with unnamed entities, i.e., arbitrarily named entities without natural designation, which would receive a motivated designation only on being confronted with the substance." This approach is exemplified in 'The Procedure Exemplified,' below from Togeby's work.

The Analytical Procedure of Glossematics

The complete procedure, including both inductive and deductive aspects, is said by Siertsema (1965: 24–25) to be best understood in terms of seven steps. The important features of each step can be summarized as follows:

(a) For a particular language, the expression units (phonemes, syllables, etc.) and the content units (word-roots, prefixes, etc.) must be discovered by means of:
  (i) relationships holding between content units and (combinations of) expression units, established by applying the commutation test (see 'Form: Discovery and Verification'); and
  (ii) properties of substance of these units.

(b) Relationships holding between an expression unit and other expression units of that language, and relationships holding between a content unit and other content units of that language, must be described without reference to their substance.

(c) The units and their relationships are tentatively drawn up into a hypothesized system for the language.

(d) Steps (a)–(c) must be repeated for as many languages as possible.

(e) Extrapolation must be made from the total of relations actually found in these languages to the total of theoretically possible relations.

(f) These theoretically possible relations must be combined into a calculus that constitutes the system of language, rather than the system of a particular language or of many particular languages.

(g) Each particular language will then be characterized by the subset of actually occurring relations that it has 'selected' from the total of theoretically possible relations. This characterization will enable the tentative systems set up under (c) to be revised and brought nearer to their definitive form.

Steps (a)–(d) are clearly inductive, leading to a set of tentative language systems. Steps (e) and (f) introduce a deductive system that is universal, i.e., language-independent; this is then used in step (g) to make predictions that will be the means of making revisions to the tentative language systems.

This approach diverges markedly from that of the post-Bloomfieldians in American Structuralism, who believed that a sound theory should be based on the correct method of proceeding from observable data to hypothesized system. For them the inductive method alone was scientifically respectable, and they sought to work in terms of a completely specified discovery procedure (*see* **Phonology: Overview**; **Post-Bloomfieldians**; **Phonemics, Taxonomic**). Only steps (a) and (c) of the glossematic procedure would have won their full approval.

Basic Relations in Glossematics

If, as glossematicians held, relations between entities in a theory are more basic than the physical properties of those entities, then it is of fundamental importance to have a typology of such relations. The relations in fact constitute an important part of the axioms of the theory.

The basic dependence is '*a* presupposes *b*' (i.e., 'if *a* occurs, then *b* occurs' or '*a* cannot occur without *b*'). A more complex set of dependences can be built up on this foundation: for example, three complex dependences that crop up frequently in linguistic study are

(a) Interdependence – *a* presupposes *b* and *b* presupposes *a*. Here *a* and *b* may occur together, but neither of them without the other.
(b) Determination – *a* presupposes *b* but *b* does not presuppose *a*. Here *a* and *b* may occur together, and *b* may occur alone, but *a* may not occur alone (in which case *a* is referred to as the *variable* and *b* as the *constant*).
(c) Constellation – *a* and *b* are compatible but neither presupposes the other. Here *a* and *b* may occur together, *b* may occur alone, and *a* may occur alone.

There are other logical possibilities, such as '*a* precludes *b*', which are not given labels, on the grounds that they play no real part in the analysis of language systems or texts.

A further distinction is brought in, between syntagmatic ('both–and') relations and paradigmatic ('either–or') relations. Each resulting type of relation is referred to by a label as shown in Figure 1. Thus in looking at a language system, the relation between vowel and consonant is always a 'complementarity', since there are no languages that do not have both vowels and consonants. However, in looking at texts in languages, the situation will depend on the language. In those languages where all syllables have a vowel and at least one consonant, the relation is a 'solidarity'; in languages where some syllables consist of a vowel alone, the relation is a 'selection.'

Dependence	*'Both–end'*	*'Either–or'*
determination	selection	specification
interdependence	solidarity	complementarity
constellation	combination	autonomy

Figure 1 Types of dependence in glossematics.

The importance of this system of relations is not the terminology, but the fact that such relations, rather than any properties of substance, are felt to be of prime importance in glossematics.

The Procedure Exemplified

Togeby's *Structure immanente de la langue française* of 1951 puts forward a deductive system whose aim is to account for the whole range of possible texts in French. Some of the more detailed statements are specific to French (e.g., statement (c), Phonology, 'French: Description of the Expression' below), but many statements are to be taken as general (universal) (e.g., statement (6) in 'French: Description of the Content' (syntax) below. Some statements are included with the aim of completeness on the general level, but with the specific caveat that they do not hold for French (e.g., statement (d), 'French: Description of the Expression' (phonotactics) below.

The summary of this work given following is intended to show what glossematicians believed the description of a language had to cover. This included an inventory of the items that were important within a language and a statement of how these items could be combined. The scope of the description should be noted: unlike some other grammatical theories, this one went beyond the level of the sentence and attempted to give an account of the structure of larger bodies of material. Thus 'text' in the previous paragraph is intended to mean any discourse – not only written, but also spoken.

The description begins by introducing the entity 'text'. No definition of the term *text* is given directly, but in fact the sequence of statements that follows, if applied correctly, produces something that does constitute a correctly constructed text in French. All other terms in the description will gain a definition in analogous fashion. This illustrates Hjelmslev's claim about how the theory works (see 'Form: Discovery and Verification' above).

One type of statement within the theory deals with constructions: a 'syntagmatic' statement of the form X: Y + Z. This may be read as 'X has components Y and Z': the order of Y and Z is not necessarily sequential, at least as far as the 'content' part of the grammar is concerned. The similarity between these statements of the glossematic theory and

phrase-structure rules in generative grammar (X → Y + Z) is noteworthy.

The other type of statement deals with systems: a 'paradigmatic' statement of the form X: Y, Z, W, meaning 'Xs are either Ys or Zs or Ws.' Alternatively this may be cast in the form (1):

(1) X: Y
Z
W

Again, the parallel with one type of rule in generative grammar is noteworthy.

The set of operations is divided into three main sections:

- a set of operations that applies in parallel fashion to expression and content alike;
- a set of operations that applies to expression alone;
- a set of operations that applies to content alone.

Each set is then further subdivided into a syntagmatic subset (dealing with constructions on a particular level) and a paradigmatic subset (dealing with the elements from which a choice may be made at the appropriate point).

French: Description Involving both Expression and Content

The syntagmatic subset is named 'syntagmatics' and consists of the following operations:

(a) *Text*: expression line + content line. (The text is divided into two simultaneous parts, one on the level of expression, the other on the level of content.)
(b) *Line*: modulation sentences. (Each of the two lines is divided into successive units consisting of intonation plus sentence; see operation (c).)
(c) *Modulation sentence*: modulation unit + sensentence. (The modulation unit is a sentence-length sequence of intonation groups.)
(d) *Modulation unit*: modulation elements. (The modulation element is the intonation pattern associated with a single tone-group.)

The paradigmatic subset is named 'systematics' and consists of the following operations:

(a) *Elements*: phonemes; morphemes; morpho-phonemes; onomatopoeias.
This division is carried out on the basis of whether the element is associated with the expression ('phonemes'), with the content ('morphemes'), with both ('morpho-phonemes' – elements further defined in operation (b)), or with neither ('onomatopoeias' – expressions like *pstt*, which do not enter into constructions and which need not obey the normal phonological rules of the language).

(b) *Morpho-phonemes*: modulations; emphases. (Modulations are intonation elements; emphases are emphatic or contrastive stresses.)

French: Description of the Expression

The syntagmatic subsection is named '*Prosodie*', which might best be translated 'phonotactics' (*see* **Phonological Words**;). This consists of the following operations:

(a) *Sentence*: syllable-groups. (Syllable-groups are very much like words, but that term is reserved for the content (see 'French: Description of the content'); *see also* **Phonological Words**.)
(b) *Syllable-group*: word-accent + syllable-group. (An operation that does not apply for French; 'word-accent' refers to the tonal elements in languages like Swedish.)
(c) *Syllable-group*: syllables (*see also*).
(d) *Syllable*: accent + syllabic base. (Another operation that does not apply for French; 'accent' refers to tone in languages like Chinese, or word-stress in languages like English.)
(e) *Syllabic base*: nucleus + margin. (The syllabic base consists of the segments (vowels and consonants) that go to make up the syllable; the nucleus is formed of vowels or, in the absence of vowels, of consonants of high sonority (nasals or liquids) – the margin is formed of consonants.)
(f) *Margin*: consonants. (The fact that some consonants may precede the nucleus and others may follow it is not specifically noted in the operation: linear order of elements is not part of this section of the theory.)
(g) *Nucleus*: marginal vowel + central vowel + marginal vowel. ('Central vowel' not in the sense of 'midway between front and back', but indicating centrality within the nucleus – more prominence than the others, and often a greater degree of openness.)

The paradigmatic subsection is named 'phonology' and consists of four operations:

(a) *Phonemes*: accents; vowels; consonants. (French has no accents, i.e., distinctive stresses.)
(b) *Accents*: strong; weak.
(c) *Consonants*: (inventory of 17 for French)
(d) *Vowels*: (inventory of 10 for French)

French: Description of the Content

The syntagmatic subsection is named 'syntax' and consists of seventeen operations, beginning with 'sentence' and proceeding in a fashion resembling the

phrase-structure rules of generative grammar via 'words' down to the smallest grammatical elements, 'morphemes'. Examples of the operations involved (2):

4. *Clause*: circumstantial complement + clause-nucleus
5. *Circumstantial complement*: { preposition + object / subordinating conjunction + clause }
6. *Clause-nucleus*: subject + predicate
7. *Subject*: apposition + nominal phrase
8. *Predicate*: { object / attribute } + verbal phrase
15. *Word*: stem + inflexions
16. *Stem*: root + derivational marker.

NB: the numbering of the preceding subset of operations follows that of the text and differs from the summary table appearing later in the book.

The paradigmatic part is entitled 'morphology' and consists of the following statements:

2. *Morphemes*:
   inflexions
   roots
   derivational markers
   particles

3. *Inflexions*:
   verbal: mood, aspect, tense
   verbo-nominal: person, number
   nominal: case, comparison, gender

4. *Roots*:
   verbs: auxiliary verbs, ordinary verbs
   nouns: proper nouns, pronouns, numbers, substantives, adjectives

5. *Derivational markers*:
   prefixes, suffixes, nonfinite verb

6. *Particles*:
   adverbs, linking words, interjections
   linking words: subordinating conjunctions, prepositions, coordinating conjunctions.

Conclusion

Although the theory of glossematics has not been further elaborated since Hjelmslev's death, there can be no doubt that many linguistic scholars in Denmark, and also some outside Denmark, have been greatly stimulated by the views he put forward and the questions he raised. Fischer-Jørgensen's work (1975: ch. 7) is a good starting point for understanding the theory and how it developed; Siertsema (1965) gives a profound exposition and critique of Hjelmslev's work. More recently, Andersen (1990) has applied the principles of glossematics, with transformations and extensions, to an examination of computers and human–computer interaction.

Perhaps the best exemplification of the theory with special reference to a particular language is Togeby (1965). There is also in this work a considerable amount of valuable comparison with other approaches.

Of Hjelmslev's own works, Hjelmslev (1961) is in many ways central for the understanding of his theory; on the other hand, some of his collected essays (Hjelmslev, 1959, 1973) are considerably less difficult for the nonspecialist.

Glossolalia

W J Samarin, University of Toronto, Toronto, Ontario, Canada

Language and Glossolalia

Glossolalia is a linguistically derivative phenomenon, possible only because those who use it – 'speak in tongues' in Christian terminology – already speak a natural language. Whereas language appeared millennia ago with a template imprinted in the brain as a distinguishing trait of *homo sapiens*, glossolalia is based on the human's skill to use the properties of language for other purposes. Whenever humans began to use 'make-believe language' – which is what glossolalia is – it must have been long after they could talk spontaneously for many other more immediately pragmatic purposes. Moreover, although language is a complex, rational code – with only suggestions (or vestiges) of expressive or playful functions that its earliest forms may have had – it has been used universally in several culturally significant ways: poetry, exorcism, curses, oaths, vows, and prayers, for example. These genres, however, are embroidered on the fabric of language, for one understands at the same time one experiences something else in a different realm of consciousness.

Paralinguistic features of language have undoubtedly characterized all languages everywhere since its appearance. Indeed, language may have been preceded by vocalisms of considerable variety for some of the purposes (and to some degree of achievement) for which millions before Socrates had used language. Of course, this was not seen by 'civilized' people like Socrates, for whom the chattering of barbarians ('primitive' peoples) could not be language. And, later, were their successors biblically literate, they might have compared the 'primitive' speech of newly discovered peoples with what they believed was the gibberish that the missionary–theologian Paul learned was being uttered at meetings of Christians in the city of Corinth.

When linguistic anthropologists began to understand both the cultures and the languages of non-western peoples, they discovered that linguistically deviant utterances were used in culturally significant ways: a shaman in an altered state of consciousness made pronouncements in a spirit's language that sounded like nothing a North American Indian was accustomed to, for the latter believed that there were just different kinds of languages – birds spoke to each other – because their own semiotic world was greater than ours. Nonetheless, feeling obliged to characterize linguistically unnatural utterances, anthropologists called shamanic and other anomalous speech glossolalia, and left it at that.

About the time that anthropology was evolving into a rigorous social science, so was psychology. Its practitioners also attended to the way some of their patients spoke to themselves and to real and imagined beings. Some of this was beyond understanding. It could not be submitted to study: it was elusive, it was gibberish. This also was called glossolalia. Indeed, anything out of which sense could not be made was glossolalia.

Better informed now, if we encounter varieties of speech that might be called abnormal, unnatural, incomprehensible, very much unlike normal language, and so forth, we do not contribute to human knowledge by classifying it as 'glossolalia.' A responsible writer would add a restrictive phrase like "but not like religious glossolalia." However, there are pseudolinguistic utterances so similar to what is found among some Christians that they might be called "secular (or profane) glossolalia," because the kind of glossolalia found in our era defines a particular form of pseudolanguage.

The Origin of Glossolalia

Although the word 'glossolalia' was first applied by commentators and historians to an allegedly peculiar speech in emergent Christianity, it is not itself a religious – that is, biblical – word. And whatever its origin, according to the *Oxford English dictionary* (2nd edition, 1989) it was not used in the English language until 1879 to refer to what one writer called "soliloquies of ecstatic spiritual emotion," when "terrible abuses of glossolaly [*sic*] broke out" and "entirely ruined the order of worship" in Corinth. The word is a compound based on the Greek words *γλωσσα* (*glossa*) 'tongue, language' and *λέγω* (*lego*) 'to speak.' This 'speaking in languages (tongues)' is mentioned in Mark 16:17, Acts 2, and I Corinthians 12–13. In the last passage the phenomenon is recognized by Paul as one of the gifts endowed by the Holy Spirit, not all of them similarly miraculous. It is clear in the text that the speech was incomprehensible and that, for the good of the Christian community, it had to be interpreted (not translated, glossolalists insist), the ability to do so also being one of the spiritual gifts. Since no sample occurs in the text, it is impossible to say what form it took and speculation would be useless. Naturally, many interpretations and explanations have been proposed (with frequent allusions to cultic behavior in the Mediterranean world), but consensus has never been – and can never

be – reached. Some believe that real languages were spoken (a phenomenon appropriately called 'xenoglossia' or 'xenoglossy'), as was supposed to have taken place miraculously on the Day of Pentecost (Acts 2); others that these were ecstatic, angelic, or heavenly languages. Some members of the modern charismatic movement accept that glossolalia may be miraculous but an 'expressive language' given by God for use in private prayer.

The History of Glossolalia

Outbreaks of glossolalia are alleged to have taken place among sectarian Christians since the beginning of Christianity (that is, since at least at Corinth), whether spontaneously in an 'ecstatic' state or in the belief that the New Testament phenomenon was reoccurring. Since there are no good descriptions of these events, all discussion is purely speculative.

Glossolalia became researchable only since the beginning of the twentieth century, when 'speaking in tongues,' the more common designation, came to be understood as a manifestation of 'being filled with the [Holy] Spirit,' an experience advocated as the ultimate in piety since the early revival movements in England and later in the United States up to the 19th century. This belief was adopted in the Pentecostal movement, originally considered a sect by other Protestant denominations. Marginal sociologically as well as theologically, it drew its followers from the socioeconomically and educationally deprived population of the United States. And because of the unrestrained exuberance of its worshipers, including altered states of consciousness, it was viewed with disrespect by other Protestants. Whereas sociologists and psychologists looked upon the movement with interest, no linguist ever did, and there are no serious descriptions of early Pentecostal glossolalia by any others.

Out of the Pentecostal subculture arose a new movement in the 1960s. Its followers were more likely to be privileged members of society and attracted Catholic and Orthodox Christians as well as Protestant. The defining characteristic of this Charismatic movement, differing from Pentecostal dogma, as the belief that glossolalia (still called 'speaking in tongues') was not just a spiritual gift but *evidence* of one's having been 'filled with the [Holy] Spirit.' The latter was the culminating experience (the 'second blessing') of being fully a child of God. Portable tape recorders now being ubiquitous, tongues could be recorded without restraint in public meetings and even in small groups and from individuals on request. Glossolalia now could be transcribed and subjected to linguistic analysis.

Explanations of Glossolalia

The first scholarly explanations of glossolalia were sociopsychological. It was alleged that this phenomenon was part of the emotional expression of deprivation and marginality in American society. (The early period of the movement coincided with the Great Depression.) On the other hand, psychological explanations, as late as the 1970s – at the height of the Charismatic movement – attributed this 'abnormal' linguistic behavior to altered states of consciousness (such as trance and 'possession') that were found in situations where 'ecstatic' states were induced by external factors such as long and repetitive singing or hypnosis. The latter explanation used the concept of 'dependent transference,' when a person in need of an authority figure and participating in a stressful group event abandons resistance to excessive behavior and, in a hypnotic state, allows the tongue to produce nonsense.

Glossolalia As a Linguistic Phenomenon

Glossolalia of the contemporary religious kind is indeed nonsense, because there is no correlation between units of sound with units of meaning. Nonetheless, it is a natural phenomenon, because it consists of authentic sounds from natural languages – most frequently those from one's native language – produced in sequence, as in natural language, but for the most part spontaneously. However, since a glossolalist unconsciously monitors (i.e., hears) what is being said, more and more can be 'learned' from one's own *glossa* (an extemporaneous 'language'). For the same reason, one can learn 'words' from other glossolalists. One widely used 'word' is some form of *shənda* (as in 'shunda'). Having acquired this word alone, the novice can go on to produce *shunda landa lasha, sundala landasa* . . . putting stress (emphasis) on any syllable and using any known or imagined sentence melody (intonation) one wants. The important thing is that the speaker *believes* that this is language and that it sounds like language. Some of it does, at a distance.

The selection of consonants and vowels is, of course, unconscious and so are the syllables constructed from them. The inventory of both sounds and syllables is generally limited, as illustrated above. Another characteristic is that glossolalic phonology is simpler than that of a speaker's language, and it appears that the speaker is reverting to an early stage of language in its acquisition by a child: e.g., *baba laba*. (Children are known to continue producing glossolalic utterances after having acquired some competence in natural language in playful creativity.)

Glossolalia is a natural phenomenon also because one does not have to be in an altered state of consciousness: one can pray or sing while driving a car at the maximum legal speed on a busy expressway. Everybody can produce a glossolalic utterance if they are uninhibited; they can even go on to make pronouncements, give a discourse, speak for God ... as experiments will demonstrate.

Erving Goffman ranks among the most celebrated sociologists in the world of the second half of the 20th century. His work ranged from urban anthropology to sociolinguistics, ethnology of communication, and microsociology with the study of social interaction. In spite of this diversity and his own refusal to subscribe to any particular trend, he is generally placed in the symbolic interactionist paradigm of sociological thought (School of Chicago).

Erving Goffman was born in 1922 in Manville (Alberta, Canada) of Ukrainian Jewish parents and spent his childhood in the Ukrainian Jewish community of Dauphin, near Winnipeg. He began studies in chemistry at the University of Manitoba in Winnipeg and worked at the National Film Board, in charge of propaganda documentaries, led by John Grierson. In 1945 he received a degree in sociology at the University of Toronto, following the teaching of the anthropologist Ray Birdwhistell, who taught that gestures, just as with institutions and social facts, are accountable of sociological analysis. After he got his M.A. in 1949 at the University of Chicago, with Everett Hughes, he was appointed research assistant at the University of Edinburgh, where he met Tom Burns, one of the leaders of British sociology. He spent more than 2 years (1949–1951) in one of the Shetland

Erving Goffman ranks among the most celebrated sociologists in the world of the second half of the 20th century. His work ranged from urban anthropology to sociolinguistics, ethnology of communication, and microsociology with the study of social interaction. In spite of this diversity and his own refusal to subscribe to any particular trend, he is generally placed in the symbolic interactionist paradigm of sociological thought (School of Chicago).

Erving Goffman was born in 1922 in Manville (Alberta, Canada) of Ukrainian Jewish parents and spent his childhood in the Ukrainian Jewish community of Dauphin, near Winnipeg. He began studies in chemistry at the University of Manitoba in Winnipeg and worked at the National Film Board, in charge of propaganda documentaries, led by John Grierson. In 1945 he received a degree in sociology at the University of Toronto, following the teaching of the anthropologist Ray Birdwhistell, who taught that gestures, just as with institutions and social facts, are accountable of sociological analysis. After he got his M.A. in 1949 at the University of Chicago, with Everett Hughes, he was appointed research assistant at the University of Edinburgh, where he met Tom Burns, one of the leaders of British sociology. He spent more than 2 years (1949–1951) in one of the Shetland

islands to gather material, based on the observation of conversational interactions, for his PhD thesis which he submitted in 1953 under the supervison of Lloyd Warner at the University of Chicago. From 1954 until 1957, he was a visiting scientist at two psychiatric hospitals, the National Institute of Mental Health in Bethesda, Maryland, and St. Elizabeth Hospital in Washington, D.C. From this experience he published *Asylum* (1961).

From 1958 to 1968, he held teaching positions at the University of California, Berkeley: visiting assistant, assistant professor, and eventually professor of sociology. From 1968 to 1982, he was offered the prestigious chair Benjamin Franklin of Anthropology and Psychology at the University of Pennsylvania. In 1981, he was elected President of the American Sociological Association. He died of cancer in November 1982 in Philadelphia.

Goffman was a part of the linguistic turn of the 1950s and 1960s, making significant contributions to linguistics by undertaking formal study of talk and developing the notions of public, self, face, demeanor, structures of attention and information, ritual, footing, and frame. His work is characterized by the interplay of concrete data and theoretical development and by the use of the metaphors of theater and stage management to draw attention to the manipulative and the moral aspects of social life.

From the time he wrote his dissertation (1953), Goffman was concerned with face-to-face interaction, and he implemented it in a formal linguistic way in his last works, *Frame analysis* (1974), *Forms of Talk* (1981), and the paper 'Felicity's condition' (1983a). Through the notions of response, footing, and frame, Goffman strengthened the connection between discourse analysis and conversation analysis. Opting for microanalysis as a method of study, he accounted for the ways in which the situatedness of speech contributes to the form and meaning of utterances, and he analyzed the procedures employed by people in their face-to-face dealings with one another. With his notion of footing, Goffman analyzed the structure of communication in social encounters. He made analytic distinctions by assigning different kinds of participant roles to hearers (the participation framework), either adressee, overhearer, or eavesdroppers, and to speakers (the production format), either animator, author, or principal. It is linguistics that provided the cues and markers to determine such footings. Levinson (1988) developed this topic in proposing a set of universal participant categories based on grammatical grounds.

It should be mentioned that when Goffman was at Berkeley, he worked on telephonic conversations with Garfinkel and Sacks while visiting them in 1963 at the Center for the Scientific Study of Suicide in Los Angeles. However, Goffman's views diverged from conversation analysis on several issues. He found it unnecessary to incorporate recorded data in his work and to analyze detailed actual interactional events. While conversation analysts use turn-taking organization, adjacency pair, and the organization of repair to deal with interaction, Goffman promoted the notion of face both as an account for action and as the motivating basis for the ritual organization of interaction. Finally, for Goffman, talk was not transparent, and conversation relied heavily on presuppositions and not on the sole turn-taking system claimed by conversation analysts.

It must be added that Goffman was an authentic stylist and that his books, noticed as early as 1959 with the publication of *Presentation of self in everyday life*, continue to be widely read outside of the restricted field of sociology. His writings, available in many languages, include eight books, three collections of essays, and at least 28 essays. His last book, *Forms of talk* (1981), was nominated for a National Book Critics Circle award in 1981.

Gondi

P S Subrahmanyam, Annamalai University, Bangalore, India

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Gondi (also written Gonḍi with ḍ representing the actual pronunciation) is a tribal language of the Central subgroup of the Dravidian family with a population of more than two million, the largest among the tribal languages of that family. Gonds of almost all regions call themselves *kōytūr* and their language *kōyāŋ*. It is spread over the five states of Madhya Pradesh, Chattisgharh, Maharashtra, Andhra Pradesh, and Orissa in India. Further, the tribe has roughly thirty social subdivisions, the well known among them being Raj Gonds, Madias, Murias, and Koyas. Because of the vast area occupied and the social subdivisions, the language has a number of dialects, which could be considered as separate languages rather than dialects because of the great variation exhibited. There is great scope for further study on the various aspects of the language. (Unless otherwise mentioned, all examples given below are from the Adilabad dialect of Andhra Pradesh.)

Phonology

Gondi contains ten vowels like the majority of its sister languages as shown in **Table 1**. The core consonant system that is common to most of the dialects is presented in **Table 2**. However, there are additional consonants in most of them. The Adilabad dialect not only retains the aspirated stops of Marathi loans, but the stops in some of the native words also take on aspiration as an additional feature, e.g., *phōṛd* 'sun.' In the northern area, while some dialects retain the contrast between r and ṛ, these two sounds merge into r in some others and into ṛ in still others. The dialects in the remoter parts of Chanda, Bastar (Muria Gondi), and the Koya area of Malkangiri have two r sounds, one a normal trill (r) and the other a strong trill (written r̲/R); the latter represents Proto-Dravidian. *t̲. In the Hill-Maria dialect, the original *r changes to a postvelar voiced fricative G; this dialect, on the other hand, preserves ḷḷ and ṇ. Koya shows glottalized t' and k' and retroflex ṇ but does not have h.

One important phonological feature that divides the entire Gondi area into three dialects is the development of Proto-Dravidian *c- in the word-initial position. The dialects of the north and west (e.g., Adilabad, Betul) show s- for it, those of the south and east show h- (e.g., Chanda, Bastar, Kanker), while it is elided in the Hill-Maria and the Koya dialects, e.g., *sovvōr/hovvōr/ovōr* 'salt.'

In some of the dialects, the contrast between short and long vowels is found only in the first syllable and vowel length is neutralized in noninitial syllables. In the Adilabad dialect, all vowels in noninitial syllables are invariably long, except in some recent loans. On the other hand, all vowels in such syllables are short in the Muria dialect.

Syntax

Word Classes

The following word classes may be recognized for Gondi: nouns (including pronouns and numerals), verbs, adjectives, adverbs (including expressives), particles, and interjections.

An adjective in Gondi agrees with the noun that is qualified in number and gender; this agreement rule, which is alien to Dravidian, is taken over from Indo-Aryan, for example:

persā marā
'big tree'
persā-ŋ marā-k
big-NON-M.PL. *tree*-PL.
'big trees'

pers-ōr māynāl
big-M.SG. *man*
'big man'
pers-ūr māynāl-īr
big-M.PL. *man*-PL.
'big men'

Adverbs may be divided into those of (a) time (e.g., *ninnē* 'yesterday,' *nēnḍ* 'today,' *nāṛī* 'tomorrow'), (b) place (e.g., *iggā* 'here,' *aggā* 'there,' *baggā* 'where'), and (c) manner (e.g., *bhāy* 'much,' *cokkōṭ* 'well').

Examples for particles include *ānī* 'and,' *mattī/battī* 'but,' *pajjā* 'afterwards.'

Examples for interjections include *hav* 'yes,' *āyō* 'no.'

Word Order

The favored word order in Gondi is S(ubject) O(bject) V(erb), for example:

vōr nā-kūn kottā-ŋ sī-t-ōr
he *I*-DAT *money* *give*-PAST-3M.SG.
'He gave me money.'

Gender and Number

Gondi shows a two-way distinction in gender, differentiating between men and all others (including women) in the singular and plural; but the masculine (+feminine) plural form also denotes, apart from men, a group of persons that contains at least one man:

vōr
'he'

vūr
'those men/men(/man) and women(/woman)'

ad
'she/it'

av
'those women/nonhumans'

Finite Verb Agreement

The finite verb shows agreement with the subject pronoun (or a corresponding noun in the case of the third person) by a change in the personal suffix (see Table 4), for example:

nannā vā-t-ōn
I *come*-PAST-1SG
'I came.'

For agreement between the demonstrative adjectives and the nouns qualified with regard to number, see 'Word Classes.'

Noun Morphology

Most of the nominal bases are underived but a few masculine ones have the suffix *-āl* and a few feminine ones *-āṛ* or *-ī*, for example:

novr-āl
'bridegroom'

novr-ī
'bride'

sēl-āṛ
'younger sister'

A nominal base is followed by the plural suffix when plurality has to be expressed. A case suffix/postposition, which occurs at the end, is preceded in most cases by one of the oblique suffixes *-d-*, *-t-* or *-n-* (conditioned variants).

Plural Suffixes

Most of the masculine nouns take the plural suffix *-r* (conditioned variants *-īr* and *-ūr*), for example:

kāṇḍī-r
boy-PL
'boys'

The plural suffix in the nonmasculine nouns has three variants: after a vowel, *-ŋ*; after a consonant, *-k*; after a disyllabic noun ending in l, *-īk*. There are some exceptions for the conditionings indicated, for example:

paṇḍī-ŋ
fruit-PL

mal-k
peacock-PL
'peacocks'

ḍuvvāl-īk
tiger-PL
'tigers'

Case Suffixes and Postpositions

The nominative is unmarked.

The accusative-dative suffix is *-ūn*. The case is unmarked in the case of inanimate nouns:

kōndā-t-ūn
bull-OBL-ACC/DAT
'bull (accus)/to the bull'

The instrumental-locative suffix is *-ē*:

kay-d-ē
hand-OBL-INSTR/LOC
'with/in the hand'

The ablative suffix is *-āl*:

kuhī-t-āl
well-OBL-ABL
'from the well'

The genitive suffix is *-ā* (variants *-nā*, *-vā*):

kuhī-t-ā
well-OBL-GEN
'of the well'

Examples for postpositions are: +*aggā* 'in, near,' +*karūm* 'near,' and +*pajjē* 'behind':

rō-t + pajjē
house-OBL-POSTP
'behind the house.'

Pronouns

The personal pronouns are:

nannā 'I'	marāṭ 'we'
nimmē 'you (sg.)'	mirāṭ 'you (pl.).'

The deictic and the interrogative pronouns are given below.

Distant	Proximate	Interrogative	
vōr	vēr	bōr	'he'
vūr	vīr	būr	'they (m.[+f.])'
ad	id	bad	'she, it'
av	iv	bav	'they (non-m.)'

The reflexive pronouns are *tannā* (sg.) and *tammō(ṭ/k)* (pl.).

Numerals

Dravidian cardinal numerals are preserved only up to seven in the Adilabad dialect (up to six in the Muria dialect and up to ten in the Betul dialect); the word for 'hundred' is also preserved in most of the dialects). These native numerals have separate forms for masculine and nonmasculine (see Table 3). The remaining numerals as well as all ordinals are borrowed in each dialect from the major language of the area.

Table 3 Native numerals of Gondi

Numerals	*Nonmasculine*	*Masculine*
1	undī	vorō-r
2	raṇḍ	i-vvīr
3	mūnd	mu-vvīr
4	nālūŋ	nāl-vīr
5	siyyūŋ	siy-vīr
6	sārūŋ	sār-vīr
7	ēṛūŋ	ēṛ-vīr
100	nūr	

The higher numerals borrowed from Marathi in the Adilabad dialect add the classifier *jhank* when they qualify a masculine noun and *jhanīk* when they qualify a feminine noun, for example:

āṭh jhank mās-ūr
eight CLASSIF *man*-PL
'eight men'

āṭh jhanīk veylō-k
eight CLASSIF *woman*-PL
'eight women'

Verb Morphology

Verb Bases

A verb base in Gondi can be simple or complex. The complex base is formed from the simple one by the addition of the transitive-causative suffix *-ūs* (conditioned variants: *-h*, *-pūs*). This suffix converts an intransitive into a transitive and an underived transitive into the corresponding causative, for example:

un- 'to drink'	u-h- 'to make to drink'
udd- 'to sit'	u-ppūs- 'to seat'
aṭṭ- 'to cook'	aṭṭ-ūs- 'to cause to cook'

Finite Verbs

A finite verb is distinguished from a nonfinite one by the presence of the personal suffix at the end of the former; a finite verb of the indicative mood is of the following structure (the past negative and the debitive are exceptions to this):

Verb Base + Tense/Negative Suffix + Personal Suffix.

There are five types of finite verb: past (suffix: *-t-*), present-future (suffixes: *-ānt-*, *-nt-*), future (suffixes: *-ak-*, *-k-*, *-n-*, *-ān-*, *-ār*), past habitual-cum-irrealis (suffixes: *-nd-*, *-d-*) and negative (nonpast; suffixes: *-ō-*, *-v-*) (see Table 4 for all the forms of *pā-* 'to beat').

The imperative suffixes are: 2sg.*-ā* (variants: -m, -Ø), 2pl. *-āṭ* (variants: *-mṭ*, *-ṭ*), for example:

Table 4 Finite forms of *pā-* 'To Beat'

	Past	*Pres.-fut.*	*Fut.*	*Past hab./irrealis*	*Neg.*
1 sg.	pā-t-ōn	pā-nt-ōn	pā-k-ā	pā-nd-ūn	pāy-ō-n
1 pl.	pā-t-ōm	pā-nt-ōm	pā-k-ōm	pā-nd-ūm	pāy-ō-m
1 pl (incl).			pā-k-āṭ		
2 sg.	pā-t-ī	pā-nt-ī	pā-k-ī	pā-nd-ī	pāy-v-ī
2 pl.	pā-t-īṭ	pā-nt-īṭ	pā-k-īṭ	pā-nd-īṭ	pāy-v-īṭ
3 msg.	pā-t-ōr	pā-nt-ōr	pā-n-ūr	pā-nd-ūr	pāy-ō-r
3 m (+f) pl.	pā-t-ēr	pā-nt-ēr	pā-n-īr	pā-nd-īr	pāy-ēr
3 fnsg.	pā-t-ā	pā-nt-ā	pāy-ār	pā-nd-ū	pāy-ō
3 fnpl.	pā-t-āŋ	pā-nt-āŋ	pā-n-ūŋ	pā-nd-ūŋ	pāy-ō-ŋ

aṭṭ-ā
cook-2SG
'Cook!'

aṭṭ-āṭ
cook-2PL
'Cook (pl.)!'

The corresponding negative imperative has the negative suffix *-m-/-v-* between the base and the personal suffix:

aṭ-v-ā/aṭ-m-ā
cook-NEG-2SG
'Don't cook (sg.)!'

aṭ-v-āṭ/aṭ-m-āṭ
cook-NEG-2PL
'Don't cook (pl.)!'

The past negative has the suffix *-makī(n)*, which is invariable for person, number, and gender:

tar-makī(n)
bring-PASTNEG
'(One) did not bring.'

The debitive has the suffix *-ānā*, for example:

tind-ānā
eat-DEB
'(One) must eat.'

Nonfinite Verbs

The past participle has the suffix *-sī* (variants: *-cī*, *-jī*):

vā-sī
come-PASTPP
'having come'

The present participle has the suffix *-sēr* (variants *-cēr*, *-jēr*), for example:

un-jēr
drink-PRESPP
'while drinking'

The negative participle has the suffix *-vāk*, for example:

veh-vāk
tell-NEGPP
'without telling'

The conditional (with the conditional suffix *-ēkē*) has three subtypes as illustrated below.

(1) Past conditional:
vā-t-ēkē
come-PAST-CONDI
'when one came'

(2) Nonpast conditional:
vā-n-ēkē
come-NON-PAST-CONDI
'when one is coming'

(3) Negative conditional:
vāy-v-ēkē
come-NEG-CONDI
'when one does not come'

Two types of verbal nouns are commonly used. One with the suffix *-māṛ* simply denotes action:

aṭ-māṛ
cook-VN
'cooking'

The other one with *-vāl* denotes action, agent, or goal:

veh-vāl
tell-VN
'telling/one who tells/the matter that is told'

Goodglass, Harold (1920–2002)

J Kegl, University of Southern Maine, Portland, ME, USA

© 2006 Elsevier Ltd. All rights reserved.

Dr. Harold Goodglass, Professor of Neurology at the Boston University School of Medicine, pioneered the application of controlled psycholinguistic studies in the field of aphasia. Well-versed in both theory and description, his publications were always on the cutting edge of theoretical issues in the field. He published more than 130 research articles as well as books on topics such as category-specific problems in comprehension and production, syntax and agrammatism, and naming disorders. His books included *Psycholinguistics and aphasia* (co-authored with Sheila Blumstein) and *Anomia* (with Arthur Wingfield). However, Goodglass was best known for his healthy skepticism and careful attention to what the individual facts have to offer. For example, once left-hemisphere dominance for language in right-handers was demonstrated, many assumed that speech for left-handers would be right-hemisphere dominant. Careful study by Goodglass revealed that, contrary to popular belief, speech is mediated in the left hemisphere for most left-handers as well.

In collaboration with Edith Kaplan, Goodglass published *Assessment of aphasia and related disorders* and an accompanying test battery, *The Boston Diagnostic Aphasia Exam* (*BDAE*). This test instrument moved the object of study in aphasia from a series of case studies to a categorization of aphasia disorders and offered a basis for comparison between syndromes and among individual cases. The *BDAE* remains a primary assessment tool in the field. The training videotapes accompanying this test battery give a glimpse of Harold Goodglass's attentive, personable, and respectful approach to interacting with patients. Whether one-on-one or in front of a large grand-rounds audience, Goodglass interviewed all patients at their own pace and on their own terms.

Goodglass made his mark on the field of aphasia in many ways, not the least of which was passing on his methodology, knowledge, healthy skepticism, and respect for patients to numerous practitioners and researchers who had the opportunity to work with him. He is especially remembered as a dedicated and highly effective mentor to women in the profession. He was a founding member of both the Academy of Aphasia and the International Neuropsychological Symposium. He established the American Psychological Association's Clinical Neuropsychology Division and served as its first president from 1979 to 1980. He was awarded the APA Gold Medal Award for Life Achievement in the application of psychology in 1996.

After receiving a B.A. in French from City College in his hometown of New York in 1939, Goodglass served in the Army Air Force from 1942 to 1946, eventually earning the rank of captain. After his return he earned an M.A. from New York University in 1948 and his Ph.D. in psychology in 1951. Upon completion of his doctorate, Dr. Goodglass became the first psychologist for the National Veteran's Aphasia Center at the Veteran's Administration in Framingham, MA, established after World War II. Goodglass remained affiliated with the Center throughout his career as it moved to the Boston VA Hospital Aphasia Unit in 1952 and eventually became the Aphasia Research Center. In 1969, Goodglass replaced Dr. Norman Geschwind as

the director and remained at that post until his retirement in 1996, when the Center was renamed The Harold Goodglass Aphasia Research Center in his honor.

Gothic is the only documented member of the East Germanic group of Germanic languages.

Early History and Wulfila's Gothic

From around the second century B.C.E. onward,various Gothic tribes migrated from southern Scandinavia to eastern and southeastern Europe, following the Vistula and Danube rivers and reaching the north of the Black Sea area by the middle of the 3rd century C.E. Tribes of Ostrogoths settled to the east of the River Dniestr and tribes of Visigoths to the west of it. In the 4th century C.E., in present-day Bulgaria, a translation of much of the Bible, based on a Greek text used in the diocese of Constantinople, was made by Bishop Wulfila (Ulfilas), a Visigoth. Portions of this (by far the greater part from the New Testament) have survived and, since this translation is the earliest literary record in any Germanic language, these are documents of outstanding importance for Germanic and Indo-European linguistic history. Significant writings in other Germanic languages begin to appear only four centuries later.

Most of Wulfila's translation has been lost. Just over half the Gospels are preserved in the surviving pages of the splendid Codex Argenteus, an Ostrogothic manuscript probably written in present-day Italy and dating from the 5th century; it is now in Uppsala. Other portions of the Gospels and of the Pauline Epistles, together with three chapters of Nehemiah, survive in various other manuscripts, the majority of them in Milan.

Wulfila designed an alphabet clearly based on that of Greek; a version used by later scribes appears in **Figure 1** with a widely used transliteration. (The two untransliterated symbols were used only to form numerals.) ⟨q⟩ is taken to be /kw/, ⟨þ⟩ to be /θ/, and ⟨ƕ⟩ to be /ʍ/ or /hw/. It may be assumed that this system is phonemic, though the following digraphs have the probable values: ⟨ei⟩ = /iː/, ⟨au⟩ = /ɔ/, ⟨ai⟩ = /ɛ/, and ⟨gg⟩ = /ŋg/. It is likely that intervocalically the letters ⟨b⟩, ⟨d⟩, and ⟨g⟩ denoted the voiced fricative allophones [β], [ð], [ɣ]. All other symbols may be given their IPA values (see **Figure 1**).

Wulfila's Gothic shows the typically Germanic features of

1. the 'First Sound Shift' development from Proto-Indo-European, thus Latin *pes* 'foot,' *tu* 'thou,' *centum* 'hundred' versus Gothic *fotus*, *þu*, *hund*;
2. strong versus weak verbs (respectively with vowel-change (*Ablaut*) versus a dental suffix in the past tense) e.g., *tiuhan* 'lead,' *haban* 'have' (infinitive) but *tauh*, *habaida* (1 sg. past);
3. weak declension of adjectives (used after a determiner) versus strong (used elsewhere), e.g., *sa goda hlaifs* 'the good bread,' *gods hlaifs* 'good bread.'

Figure 1 Reprinted from *Concise encyclopedia of language and religion,* Sawyer *et al.* (eds.), J. M. Y. Simpson, '*Gothic,*' p. 189, Copyright (2001) with permission from Elsevier.

Among various archaic features are the retention of a masculine nominative ⟨-s⟩, e.g., *fisks* 'fish' and reduplicating verbs, e.g., *greten* 'weep' (infinitive), *gaigrot* (1 SING PAST).

Morphologically, Gothic is fairly complex. Verbs show inflections for (a) past and nonpast tenses; (b) indicative, subjunctive (sometimes called 'optative'), and imperative moods, plus an infinitive form; (c) active and passive voices; (d) first, second, and third persons; and (e) singular, dual, and plural numbers. Nouns, adjectives, and pronouns show inflections for (a) masculine, feminine and neuter genders; (b) singular and plural numbers; and (c) nominative, accusative, genitive, and dative cases. However, there are not distinct morphological forms for every possible combination of these grammatical categories. Pronouns have in addition distinct forms for the dual number.

The syntax of Wulfilas's text is very strongly influenced by that of his Greek source: the original word order is closely followed and many Greek devices, such as characteristic participial constructions, are imitated. As a result almost no information is available on what a native Gothic syntax might have been.

Other records of early Gothic are meager in the extreme. They include fragments of a commentary on St John's Gospel (the *Skeireins*), a few marginal notes on Latin manuscripts (including a title deed from Ravenna, now in Naples), and one or two runic inscriptions that have been claimed to be in Gothic.

Other East Germanic Languages

Related East Germanic languages, spoken by tribes who emigrated from southern Scandinavia about the same time as the Goths and even earlier, include those of the Vandals (who eventually established themselves in North Africa) and of the Burgundians (who set up a kingdom in Gaul); both languages became extinct in the 6th and 7th centuries and almost nothing is known of them except personal and place names.

Influence of Gothic on Other Languages

The Visigoths engaged in missionary work, spreading their Arian version of Christianity (which held that Christ, though divine, was not equal with the Father) among other East Germanic tribes, for whom Gothic was apparently a lingua franca. For example, the Burgundians, Vandals, and Ostrogoths were converted in the 4th and 5th centuries. It has been claimed that this missionary activity led ultimately to the appearance of a few specifically Gothic linguistic forms in the Bavarian and Alemannic dialects of Old High German (a West Germanic language), and even as far afield as Old English. The route and extent of this influence, however, and the question of whether it was direct or indirect, are subjects of scholarly debate.

Later History and Crimean Gothic

Some Goths, forced out by invading Huns in the 3rd century, migrated westward and founded kingdoms in modern Italy (Ostrogoths), France, and Spain (Visigoths), but their power was shattered everywhere by the beginning of the 8th century and Gothic became extinct in the west.

The language lived on longer in the east, surviving in present-day northern Bulgaria until the 9th century and in the Crimea until the 16th century, according to accounts by travelers. One of the last of these was by Ogier Ghiselin (or Ghislain) de Busbecq, the imperial ambassador to the Ottoman court at Constantinople in 1560–1562, who recorded 68 Crimean Gothic words as well as some phrases and numerals, with Latin translations. This collection is of rather limited value, for it was published without his permission and may contain misprints; more importantly, his two informants were dubious, one being a native Greek speaker. A great lack is that of any indication of morphological variation and syntax. Nevertheless, it appears possible that Crimean Gothic was a descendant of a somewhat different variety of Gothic from that of Wulfila.

Busbecq also notated a short 'Gothic' song (the *Cantilena*) but he gives no translation and it has been variously claimed to be not Gothic but Turkish, Swedish or Italian.

By the end of the 18th century C.E. Crimean Gothic had apparently died out.

Government Phonology

N A Ritter, University of Connecticut, Storrs, CT, USA

© 2006 Elsevier Ltd. All rights reserved.

Government Phonology (GP) is a theoretical approach to characterizing and explaining the ways sounds (or, rather, phonological segments) are combined and organized in languages, both generally (across languages) and language specifically. Such organization is defined along two dimensions: internally to the segment itself, in terms of primes, and externally, in terms of forming syllabic units. As every phonological theory must, it also attempts to render a uniform, systematic explanation for varied sound changes, additions, and deletions that may arise when two morphemes combine within a word.

The theory of phonological government set out by Kaye, Lowenstamm, and Vergnaud in their seminal 1990 article (Kaye *et al.*, 1990) is mainly a theory of prosodic government or prosodic well-formedness of onset-rhyme sequences. In other words, the structure of a syllable or of a string of syllables within a word is a consequence of the relations that hold among phonological segments. These relations take the form of asymmetrical head/dependent (*see* **Dependency Phonology**) or governor/governee relations; the latter is from which GP takes its name. The contribution of GP is to draw a parallel with syntax by utilizing the same innate universal principles that appear to express certain properties of the mind, such as asymmetrical head/dependent relations (*see* **X-Bar Theory**). Moreover, as in certain syntactic approaches, a representation in GP theory is not necessarily surface true in terms of that representation being fully pronounceable as it appears. Rather, a representation can, for example, include positions that are empty of content, requiring the representation to be interpreted by appealing to certain principles and operations.

Government: Structural Relations within and between Constituents

The three syllabic constituents recognized by this theory are the Onset (O), the Nucleus (N), and the Rhyme (R). The Rhyme is a projection of the Nucleus head. In this way, syllables are characterized by Onset-Rhyme packages, rather than as constituents in themselves. The traditional coda position is also not recognized as a syllabic constituent of its own in GP, for it does not display the same properties universally as the other constituents do, namely, that the coda is not present in all linguistic systems and it cannot branch (cf. Kaye, 1990a). Rather, the coda, if present, occupies the 'postrhymal position' (cf. **Figure 1C**), i.e., the rightmost position of a binary branching rhymal constituent, and it must be followed by an onset (cf. **Figure 4B** and the discussion of 'Coda Licensing'). In traditional GP, a segment is linked to a syllabic constituent by means of an intermediary skeletal or timing tier represented by **x**. Each such syllabic constituent constitutes a governing domain that may be binary, unary, or null, with the exception of the Nucleus, which must always be present as it is the core of the syllable. **Figure 1** illustrates each maximal and minimal domain for each syllabic constituent Onset, Nucleus, and Rhyme (parentheses indicate optionality).

Figure 1 A representation of each constituent type: (A) Onset (B) Nucleus (C) Rhyme, showing the possible structural domains for each.

When a syllabic constituent branches, a governing domain is formed where one member is considered the head or governor and the second member is considered the dependent or governee. GP claims that, universally, governing domains within constituents are head-initial (i.e., the governor is the leftmost member) and thus exhibit left-to-right government. The determination as to which constituents may branch in a language will be subject to parametric variation in each language. Examples of this type of 'constituent government' are illustrated in Figure 2 (the head of each governing relation is underlined).

The possibility of having a branching nucleus within a branching rhyme (see Figure 3) is prohibited as government is strictly local between adjacent x-slots. A nucleus head cannot govern its postrhymal position when a nucleic dependent position is in between them (* = illicit representation).

This illicit structure can be understood to be the result of the configurational notion of 'c-command,' which subsumes notions of sisterhood and strict locality, where the first branching node that dominates the nucleic head must also dominate the skeletal point in question. In the case of Figure 3, the first branching node N dominates the nucleic head and its immediate sister under N, but not the coda position, which is contained in a higher branching node.

In addition to government within constituents, a variety of government relations between the higher-level constituents themselves are also claimed to be universal among languages. Although this type of government, called 'interconstituent government,' operates *between* different constituent types (cf. Figure 4), and as such might seem to indicate that the relations between the domains are not as cohesive as the governing relations within the constituents themselves (e.g., c-command does not apply here), the notions of strict locality and strict directionality do apply, albeit at a higher level. However, within interconstituent government, the head is final (rightmost in a binary relation), and government thus operates from right to left. Examples of this type of government (as presented in Kaye *et al.*, 1990) are illustrated in Figure 4.

The structure in Figure 4A illustrates the governing relation between an onset-rhyme sequence and captures the notion that an onset must be followed by a rhyme for the onset to be present; this ensures that an onset cannot exist in a syllable on its own. There is no reverse structural relation in which the presence of an onset is necessary to govern a preceding rhyme or nucleus. This phenomenon is encoded in the 'Licensing Principle,' which states that the only position within an onset-rhyme domain that need not be licensed is the head of that domain or the nucleus. The O←R sequence thus comprises a well-formed phonological string or syllable. The well-formedness of consecutive onset-rhyme sequences (or syllables) yields the Word.

While the structure in Figure 4B does depict a relation between an onset and a preceding rhyme, this type of government relation ensues only when the rhyme contains a postrhymal position (traditionally known as the coda). This type of structure (along with phonotactic constraints) accounts for the presence of certain postvocalic consonant sequences often found in languages (such as nasal-obstruent, fricative-stop, liquid-obstruent, *inter alia*). This specific relation between the terminal nodes of onset head and postrhymal dependent falls under the label of 'Coda Licensing.'

Figure 4C is a constituent relation that occurs at the projection on which only rhymes (i.e., nucleic heads) are visible and depicts the governing relation between two adjacent syllabic nuclei; this type of relation was originally designed to account for the possibility of vowel sequences, such as cases where no onset intervenes between two vowels, but it can also be extended to explain vowel harmony or stress phenomena (cf. Ritter, 1999).

Figure 2 Representations of constituent government.

Figure 3 Prohibition of a ternary rhyme due to strict locality.

Figure 4 Representations of interconstituent government.

Figure 5 Representation of a surface word-final consonant followed by a final empty nucleus.

In their discussion of relations between constituents, Kaye *et al.* (1990) omit any discussion about the relation between two onset constituents. More recently, 'inter-onset government,' i.e., government between two onset constituents, has been addressed and explored more seriously (cf. Kaye, 1990b; van der Hulst and Ritter, 1998; van der Hulst and Ritter, 1999; Ritter, forthcoming).

Constituent government and interconstituent government are considered to be invariant structural relations that are a fundamental part of the innate knowledge of Universal Grammar. In addition to these structural relations, the Projection Principle was invoked to ensure that such governing relations must be maintained throughout, despite cases of morpheme concatenation, or where vowel deletion or insertion processes appear to occur (see discussion below about vowel-zero alternations). Such a principle guarantees that structure preservation of a domain will ensue and that rules of resyllabification, as occur in other generative theories, will not be invoked. Since resyllabification is disallowed in GP, a consonant, for example, whose position could fluctuate in other frameworks between word-final and syllable-initial when a vowel-initial morpheme is added (as in hea*t* vs. hea.*t*er), can only be represented structurally in GP as an onset followed by a nucleus that is empty of segmental content (see Figure 5).

In this example, the persistent onset status of /t/ is independently enforced by the interconstituent government relation in Figure 4(b), requiring that the presence of a postrhymal position be governed by an onset position. The principle of Coda Licensing enforces this relation by claiming that a postrhymal position must be licensed by a following onset. When there is no such onset to license this position, the post-rhymal position containing a segment will be unlicensed. To represent a word-final consonant in GP, then, the only remaining possibility is that the segment appear in an onset position; yet, according to the interconstituent government relation in Figure 4A, a rhyme must follow the onset to govern it. However, in the case of a word ending in a consonant with no audible vocalic sound, the rhyme then must be represented as phonetically inaudible. This is achieved by claiming that the rhymal position is present, but it is empty of segmental content.

Consequently, the principle of Coda Licensing ensures that single consonants are universally maximized into the onset position when they appear intervocalically or are domain final. Additionally, under this approach, a segment that would have been considered in other frameworks to be a word-edge extrasyllabic element will, in this approach, be handled as an onset followed by an empty nucleus that is not phonetically realized. The possibility of a domain-final nucleus to be empty is a parametric choice of a language. Languages that will allow final empty nuclei are those languages that allow words to end in consonants (as in English, Dutch, French). Languages that do not allow final empty nuclei are those languages that do not exhibit consonants at the ends of words (e.g., Italian).

Phonetically Empty Nuclei

As pointed out above, the notion of empty nuclei is integral to the approach of Government Phonology. Consequently, to constrain the usage and proliferation of such entities, the theory posits the 'Empty Category Principle.' This principle claims that (a) a licensed empty nucleus has no phonetic audibility, and (b) such an empty nucleus is licensed if (i) it is 'properly governed,' or (ii) it is domain-final in languages that parametrically opt to license domain-final empty nuclei. Whereas 'domain-final' empty nuclei are subject to parametric variation, 'internal' empty nuclei are subject to Proper Government. Proper Government is an operation that allows for an internal empty nucleus to receive no phonetic interpretation and thus be realized as inaudible when

Figure 6 An example of proper government with a licensed word-final empty nucleus.

(a) it is followed by a phonetically contentful nucleus (on a level where only nuclei are projected), and (b) there is no governing domain (such as a coda-onset domain) separating the two adjacent nuclei. The direction for proper government will be parametrically set for each language; however, the tendency in the literature has been for the operation of proper government relations to scan from right to left throughout a word (see Figure 6).

In Figure 6, the language has set proper government to operate from right to left. It has also set the parameter for the licensing of final empty nuclei to be on. All nuclei in this example are represented as empty of any segmental content. Because the final nucleus is licensed to remain empty, it is not phonetically contentful and so cannot properly govern the penultimate nucleus to its left (N_2). If N_2 is not then properly governed, it will be unlicensed to remain empty and will be forced to be phonetically realized. Phonetic realization of an empty nucleus can differ in each language (cf. Kaye, 1990b; Charette, 1991; Ritter, 1995 for examples). Because N_2 is unlicensed to be empty and is phonetically contentful, it can properly govern the adjacent N_3 nucleus. N_3 will then be licensed to remain empty and will be phonetically uninterpretable. The postulation of internal empty nuclei and this type of proper government were designed to permit a vowel to alternate with zero when the vowel is 'underlyingly' empty (Kaye, 1990b). An example of vowel-zero alternation from Hungarian is given in Figure 7.

Phonetically empty nuclei also play an important role in GP's explanation of crosslinguistic differences observed among languages regarding the status of consonant sequences. While some languages, for example, permit triconsonantal sequences medially, others do not. Those languages which do not, when confronted by a sequence of three consonants, due to morpheme concatenation, will require some repair strategy such as consonantal loss or vocalic epenthesis

Figure 7 An example from Hungarian of vowel-zero alternation: (a) bokor: bush. NOMINATIVE, (b) bokrok: bush-PLURAL NOMINATIVE.

to break up the cluster. The principle of 'Government Licensing' was developed by Charette (1990, 1991) in an attempt to unify under one principled approach the different circumstances under which consonant sequences may be found. Government Licensing claims that an onset can only govern its preceding postrhymal complement interconstituently (cf. Figure 4B) if it is so empowered (i.e., given license to govern) by its following nucleus. Crosslinguistic differences arise as a consequence of whether a language parametrically selects that this nucleus, in order to empower its onset to govern, must be audible or can be phonetically null. If a language evidences surface triconsonantal sequences word internally (as in the word [pa*rvn*ir], allowed in certain varieties of French; also found in Polish), the triple cluster is represented as a two consonant cluster of postrhymal coda followed by a simplex onset, which then in turn is followed by an empty nucleus (the governor/licensor for this domain) and an onset following the nucleus (see Figure 8).

The parameter in this language type is set to allow the word-internal empty nucleus to be a licit government-licensor for the interconstituent cluster preceding it. In languages where one of the consonants of the governing onset-rhymal relation is lost, it is claimed that the empty nucleus following such a

Figure 8 A representation of a surface word-medial triconsonantal cluster (example from French, parvenir: reach-INFINITIVE).

Figure 9 A representation of a surface word-medial triconsonantal cluster where indirect government licensing applies.

relation is not permitted to be a government-licensor and has not been parametrically selected as such by the language. The inability of the word-internal empty nucleus to government-license its preceding onset, will directly affect the ability of the onset to in turn govern its rhymal complement. The disallowance of this governing relation will necessitate the deletion of one of the component consonants.

Another type of case of a potential three-consonantal cluster occurs when a branching onset is involved. In this case, shown in Figure 9, the onset constituent must be licensed by a following nucleus in order for the head of the onset domain to govern its onset dependent. This is a form of '*indirect* government licensing.'

GP appeals to indirect government licensing as a separate parameter for word-internal empty nuclei in order to account for the fact that the pronunciation [li*brm*ən] (*librement*: freely) is *not* possible in any variety of French. The restriction on this pronunciation occurs because the word-internal empty nucleus following the onset domain of *-br-* has no licensing power in such a context. In Polish, on the other hand, this type of cluster can arise.

To account for the difference in consonant sequences that sometimes occur word internally versus those that occur word finally, a distinction is drawn between word-internal and word-final nuclei as government-licensors. Thus, in French, the pronunciation [tabl] (*table*: table) *is* possible because the *word-final* empty nucleus that is licensed to be silent can be an indirect government licensor to license the onset head /b/ to govern its dependent /l/. Separate parametric settings are needed to distinguish whether (a) internal empty nuclei can be government-licensors (either direct or indirect), and (b) whether domain-final empty nuclei can be government-licensors (either direct or indirect). These different possible settings will yield different language types.

Government versus Licensing

Government Phonology employs two different terms: *government* and *licensing*. Because it may not be readily clear from the nomenclature assigned to certain principles or processes using these terms what the effects of these two different notions are, some clarification is necessary. Given the original usage of the term, *government* is reserved for defining and limiting what the possible *structural relations* within and between constituents may be. In other words, government is concerned with building a structural framework from the skeletal level upward. *Licensing*, on the other hand, seems to be an extra feature (or layer) that ensures whether a position (while possibly viable in structural terms) is permitted to exist, depending upon its context. Thus, in the case of *government licensing*, though a language may have a parameter setting for branching onsets, the dependent of the onset may only be governed by its onset head if the onset head is itself *licensed* by its following nucleus (the head of an O-R package). Recall that the segmental quality of the *licensor* nucleus, be it full or empty, is what is crucial in such cases. When the nucleus is empty, the language will choose whether the empty nucleus can be a licensor for the onset-head governor. If the empty nucleus is not a valid licensor, the onset head will not be licensed to govern its dependent, and the dependent will be unrealized on the surface.

Licensing, unlike government, then, must look *below* the skeletal tier. This is especially apparent in the case of licensing at word edges, for example, word-final nucleic licensing. Here the type of content of the nucleic position, namely, segmental emptiness, is licensed by virtue of it being word-final. There is another type of licensing that occurs at the initial edge of the word and is reserved specifically for a rhyme that contains an empty nucleus followed by a post-rhymal position containing the segment /s/. This type of licensing is called 'magic licensing' and was

formulated to account for word-initial *sC* clusters that are found in a number of languages (Kaye, 1992). These two edge cases of licensing concern nuclei that are empty of content. Their special licensing needs come from the fact that they are anomalies to the Licensing Principle. Because a nucleus is the head of an O-R domain, it inherently must be contentful: the unmarked case. When a nucleus is empty of content, and thus marked, its existence comes into question, and it must be externally licensed to remain if the language allows for that choice. Similarly, the operation of 'proper government,' despite its name, behaves more like a *licensing* operation in its task of licensing empty nuclei to remain empty or not.

With respect to the notion of Coda licensing, this might appear to some to be a somewhat different phenomenon. Although the term utilizes the word *licensing*, it was originally conceived of as a *principle* of UG (cf. Kaye, 1990), which claimed that no domain could terminate in a closed syllable. In effect, it reiterates or reenforces an already existing interconstituent governing relation between a postrhymal position and its following onset; however, it goes further to specifically tackle the problem of single word-final coda consonants *vis à vis* closed syllable effects. It ensures that a single word-final consonant, having no following consonant as its onset licensor, cannot be represented in the postrhymal position. The only other structural means then in the theory for representing such a consonant is as an onset itself followed by an empty nucleus. Coda licensing could very well then be seen to fall under the auspices of licensing in that the existence of the coda position is dependent upon there being a consonant (naturally, of the appropriate segmental type) in the following onset. So, in this case, too, the notion of licensing assesses whether the ability to have a postrhymal position in a language that allows branching of rhymes is legitimate.

In effect, government sets forth the *universal laws* concerning structure within and between constituents. Licensing, however, appears to be the enforcer of those relations, by checking whether positions can exist depending upon the context they are in (in other words, the licensing relation they enter into with their licensor), for example, whether followed by an empty position, or depending upon their segmental content or lack thereof (cf. van der Hulst, forthcoming for a different view).

Intrasegmental Structure

In addition to GP appealing to notions of government and licensing to deal with segment external relations, the theory has also developed an approach to characterize the melodic content or internal structures of phonological segments; the two domains are not independent from each other because the internal content is claimed to determine the combinatory power of such segments. This theory does not adhere to distinctive features. Rather, the ultimate constituent of a phonological segment is referred to as an *element*. An element is a cognitive category, i.e., a phonological category that maps onto its own distinct acoustic signature or elemental pattern. Each univalent element is fully specified and has its own defining property, enabling it to be fully pronounceable. Some of the traditional GP elements and their salient properties are listed in Figure 10 for reference.

A	non-high	[a]	R	coronal
U	labial/round	[u]	?	occluded
I	front/palatal	[i]	h	noise
v	none	[ɨ]	N	nasal
I	ATR		H	high tone/stiff vocal chords
			L	low tone/slack vocal chords

Figure 10 Traditional elements used in GP.

A segment in the GP model may be composed of either a single primitive element, or a fused combination of primitive elements, for instance as in (A.I) (where I is the head) yielding the segmental expression [e]. When two or more elements combine to form a complex segment, they enter into an ordered relation of head/dependent (also termed head/operator). In this type of relation, one element assumes the role of the head, and, in so doing, contributes its salient acoustic qualities or characteristics to the segmental expression. The remaining elements within that expression act as dependents and can be considered as lending additional acoustic information that modifies or contributes to the sound in some way.

Originally, restrictions on the manner in which elements combine and are organized into segmental systems of vowels and consonants was explained by the 'Theory of Charm,' a three-valued system consisting of positive, negative, and neutral charm (Kaye *et al.*, 1985). The notion of charm seemed to correlate to some extent with the traditional concept of sonority classifications, ranking sounds in terms of their relative stricture. Elements of unlike charm value would attract each other while those of identical charm value would repel each other, and neutrally charmed elements had no restriction on combining. Tying this into the syllabic structure then, heads of domains, or governors, contained charmed segments while governees were charmless.

The notion of charm quickly gave way to the notion of complexity. 'Complexity' refers to the number of elements needed to compose a segment. Low complexity (for example, one element such as A characterizing a vowel /a/) corresponds with higher sonority. Correlatively, obstruents, being the most complex as they contain place elements as well as manner elements and voicing elements, are the least sonorous. Segmental complexity relations were then appealed to in order to determine whether a governing relation was well-formed. For a segment to be a governor, it had to be more complex than or as complex as its governee (cf. Harris, 1990).

Recent Developments

There have been movements to revise and minimize aspects of the traditional GP theory. One approach has been to do away with branching within constituents and claim only a strict CV theory (Lowenstamm, 1996, Scheer, 2004). This approach claims that appealing to a CVCV representation can more readily capture generalizations found in both templatic and nontemplatic languages regarding disparate phenomena such as compensatory lengthening, closed syllable shortening, the behavior of geminates and long vowels, and consonant clustering.

Another movement has focused on the internal aspects of the segment and attempts to eliminate a number of the elements listed in Figure 10, such that the few remaining elements can operate equally within vocalic or consonantal segments, yielding different phonetic interpretations depending upon which syllabic constituent they are associated with (cf. Jensen, 1994, Ritter, 1997). Moreover, it is claimed that by constraining the set of primitive elements that composes a segment, the factorial power of the various combinations of such elements is reduced, resulting in a less expansive and less powerful means of generating unattested speech sounds.

In an attempt to rid the theory of a few anachronistic elements that only appear in one type of segment and not another, an interesting approach has been appealed to, that of 'headed' vs. 'empty-headed' segments. The first proposal was aimed at eliminating the ATR element by positing tense vowels as headed expressions and lax vowels as empty-headed ones. In other words, a vocalic segment whose head position contains an element is considered an ATR or tense segment. A segment that has no element in its internal head position is a non-ATR segment or lax. The use of this headedness distinction was then generalized by Ritter (1997) to represent intrinsic manner distinctions in consonantal segments. Asymmetrical headedness was appealed to in order to mark the difference between segments made with total closure (namely, stops) and those made with partial or no closure (namely, fricatives, liquids, and glides). For example, if a language exhibits a phonemic distinction between labial stops and fricatives, this contrast is defined in terms of the labial element (U) being in the head position of the segment to represent the stop, and in the dependent position of an empty-headed segment for the fricative. In so doing, the glottal element could then be eliminated and supplanted by the notion that asymmetrical headedness corresponds to general phonetic characteristics of stricture.

Grammar

B Aarts, University College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

The Term 'Grammar'

There are many different ways in which the term 'grammar' can be understood. In its most widely used sense, grammar comprises syntax (the study of sentence structure) and morphology (the study of the structure of words). 'Grammar' can also refer to a physical object, i.e., a book, and one can felicitously say "I have at least six different grammars of English on my bookshelf." A grammar in this sense is a description of a language, and can be written from different perspectives. Thus, **school grammars** have as their aim to teach the basic principles of grammar. They are usually simplified and can be relatively unsophisticated. They also tend to be **prescriptive** in outlook, rather than **descriptive**. School grammars were very widely used in the 18th and 19th centuries. Similar in their aims, but more modern in outlook, because they are based on research in modern linguistics and are descriptive in outlook, are **pedagogical grammars**. These are used in many different teaching environments: secondary schools, foreign language teaching schools, as well as universities. Nineteenth century descriptive accounts of particular languages are called **traditional grammars**, while their modern (i.e., post-1950) counterparts are usually referred to as **descriptive grammars** or **reference grammars**. These works provide lengthy and detailed accounts of the entire field of grammar (as defined at the beginning of this article). On the history of grammar writing in English, see Linn (2005).

The term 'grammar' has also been used in a more specialized sense in the framework of linguistics developed by Noam Chomsky, and can have several meanings: it can refer to the mental blueprint that all humans are said to be endowed with (Universal Grammar, UG), or to the grammar that has evolved in an individual human being as a result of the interaction of the principles of UG with a particular linguistic environment ('That construction is not part of my grammar'). Finally, it can refer to a linguist's theory of the grammar of a particular language.

In what follows, this article will give a brief overview of the syntactic components of grammar.

Grammatical Categories, Functions, and Thematic Roles

All grammatical frameworks make use of categories such as **word classes** (noun, verb, adjective, etc.) and most also make use of **phrases** (noun phrase, verb phrase, adjective phrase, etc.). These combine to form **clauses** and **sentences**. The sentence in (1) can be represented as in (2) below, where word classes are indicated by means of a **labeled bracketing**:

(1) The chirpy postman claimed that he handed me the letters yesterday in the morning.

(2) $[_{S/MC}$ $[_{NP}$ $[_{Det}$ the] $[_{AP}$ chirpy] $[_{N}$ postman]] $[_{VP}$ $[_{V}$ claimed] $[_{SC}$ $[_{SCJ}$ that] $[_{NP}$ $[_{N}$ he]] $[_{VP}$ $[_{V}$ handed] $[_{NP}$ $[_{N}$ me]] $[_{NP}$ $[_{Det}$ the]$[_{N}$ letters]] $[_{NP}[_{N}$ yesterday]]$[_{PP}$ $[_{P}$ in] $[_{NP}$ $[_{Det}$ the] $[_{N}$ morning]]]]]]]

The Term 'Grammar'

There are many different ways in which the term 'grammar' can be understood. In its most widely used sense, grammar comprises syntax (the study of sentence structure) and morphology (the study of the structure of words). 'Grammar' can also refer to a physical object, i.e., a book, and one can felicitously say "I have at least six different grammars of English on my bookshelf." A grammar in this sense is a description of a language, and can be written from different perspectives. Thus, **school grammars** have as their aim to teach the basic principles of grammar. They are usually simplified and can be relatively unsophisticated. They also tend to be **prescriptive** in outlook, rather than **descriptive**. School grammars were very widely used in the 18th and 19th centuries. Similar in their aims, but more modern in outlook, because they are based on research in modern linguistics and are descriptive in outlook, are **pedagogical grammars**. These are used in many different teaching environments: secondary schools, foreign language teaching schools, as well as universities. Nineteenth century descriptive accounts of particular languages are called **traditional grammars**, while their modern (i.e., post-1950) counterparts are usually referred to as **descriptive grammars** or **reference grammars**. These works provide lengthy and detailed accounts of the entire field of grammar (as defined at the beginning of this article). On the history of grammar writing in English, see Linn (2005).

The term 'grammar' has also been used in a more specialized sense in the framework of linguistics developed by Noam Chomsky, and can have several meanings: it can refer to the mental blueprint that all humans are said to be endowed with (Universal Grammar, UG), or to the grammar that has evolved in an individual human being as a result of the interaction of the principles of UG with a particular linguistic environment ('That construction is not part of my grammar'). Finally, it can refer to a linguist's theory of the grammar of a particular language.

In what follows, this article will give a brief overview of the syntactic components of grammar.

Grammatical Categories, Functions, and Thematic Roles

All grammatical frameworks make use of categories such as **word classes** (noun, verb, adjective, etc.) and most also make use of **phrases** (noun phrase, verb phrase, adjective phrase, etc.). These combine to form **clauses** and **sentences**. The sentence in (1) can be represented as in (2) below, where word classes are indicated by means of a **labeled bracketing**:

(1) The chirpy postman claimed that he handed me the letters yesterday in the morning.

(2) $[_{S/MC}$ $[_{NP}$ $[_{Det}$ the] $[_{AP}$ chirpy] $[_{N}$ postman]] $[_{VP}$ $[_{V}$ claimed] $[_{SC}$ $[_{SCJ}$ that] $[_{NP}$ $[_{N}$ he]] $[_{VP}$ $[_{V}$ handed] $[_{NP}$ $[_{N}$ me]] $[_{NP}$ $[_{Det}$ the]$[_{N}$ letters]] $[_{NP}[_{N}$ yesterday]]$[_{PP}$ $[_{P}$ in] $[_{NP}$ $[_{Det}$ the] $[_{N}$ morning]]]]]]]

S=sentence, MC=main clause, NP=noun phrase, Det=determiner, N=noun, AP= adjective phrase, VP=verb phrase, V=verb, SC=subordinate clause, SCJ=subordinating conjunction, PP=prepositional phrase

Further grammatical categories include **gender, number**, and **case**. Words that belong together distributionally as units are called **constituents** (all the bracketed strings in (2)). Not all linguists recognize the concept of constituent. In dependency frameworks, only the relationships between words are recognized.

All the labels assigned to the categories in (2) are **form labels**, which also perform a particular **function**. This includes the most prominent element of each phrase, referred to as its **head**. In addition, in (1)/(2) the NP *the postman* functions as the subject of the sentence, while the verb *claim* functions as **predicator**. The subordinate *that*-clause functions as the **direct object (DO)** of the verb, while within the subordinate clause, *he* is the subject, *handed* is the predicator, *me* is an **indirect object (IO)**, *the letters* is direct object, and *yesterday* is an **adjunct**. The form and function classes are defined primarily with reference to their distribution in most frameworks, though some frameworks opt to define the classes semantically and/or pragmatically.

Conventionalized patterns of language are called constructions. The notion of **construction** can be defined very narrowly (e.g., determiner + noun) or more broadly (for example, the *What's X doing Y?* construction, e.g., *What's this cork doing in my glass of wine?* discussed in Kay and Fillmore, 1999). Some linguists argue that constructions do not play a role in grammar at all; they regard them merely as epiphenomena (Chomsky, 1995: 170), i.e., as derivative entities with no primitive role to play.

At the syntax–semantics interface, the phrase *the postman* and the *that*-clause in the main clause, as well as the subject, IO and DO of the subordinate clause carry **thematic roles**. These concern the semantic role played by the constituents in the eventuality or situation expressed by the predicator. Thus in (1) *the postman* has the role of **agent** (active, animate instigator) in both clauses, while *me* has the role of **recipient**. *The letters* is the **patient/undergoer** of the action, sometimes also referred to as **theme**. There is no agreed set of thematic roles, but most linguists would recognize, in addition to the roles named above, **instrument**, **locative**, and **source**.

Not all linguists agree that the categories that are set up in particular grammars can always be strictly kept separate; some frameworks allow for **gradience** within and/or between categories.

Coordination and Subordination

Coordination and subordination are ways for languages to link units. When we coordinate units, we link units that are syntactically at the same level, i.e., the units are not dependent on, or embedded within, each other. Examples of coordination are given in (3):

(3) [Tom] and [Harry]
[the postman] and [his wife]
[cheap] and [cheerful]
[grudgingly] and [reluctantly]
[in the house] and [on the stairs]

We have already come across an example of subordination. In (1), the *that*-clause is a **subordinate clause**. Such clauses can perform a variety of functions. As we have seen, in (1) the clause functions as direct object. In (4) it functions as subject, while in (5) it functions as an adjunct:

(4) *That the minister should resign* is obvious.

(5) We expected to arrive on time, *when we left home*.

In (4) the subordinate clause is said to be **embedded**, because it is one of the obligatory elements required by the verb, while this is not the case in (5) (*see* **Subordination**).

Systems of Grammar

Grammars of languages make use of a number of **systems of grammar**. Each of these provides users of languages with a set of choices for a given classification. We distinguish three types of systems. What we might call **pattern systems** comprise a set of choices for a given classification. **Interface systems** linguistically encode a particular real world concept, eventuality, situation, or set of related meanings into a particular grammatical form or pattern. Finally, **information-ordering systems** offer users ways of presenting the propositional content of an utterance in different ways. Examples of each type of system follow below.

An example of a pattern system is a classification of clauses which comprises the **declarative**, **imperative**, **interrogative**, and **exclamative** types:

(6)	Tom always eats his dinner quickly.	declarative
(7)	Does Tom always eat his dinner quickly?	interrogative
(8)	Eat your dinner quickly!	imperative
(9)	How quickly Tom eats his dinner!	exclamative

Each of these patterns has its own unique syntactic properties, e.g., subject-auxiliary inversion in the case of interrogatives, or the lack of a subject in the case of imperatives.

The **pronoun classifications** of languages constitute another example of pattern systems. English uses *you* to address an interlocutor, while other languages

may have informal and polite forms, such as French *tu/vous*, German *du/Sie*, Dutch *jij/U*, etc. Some languages (especially in Africa) make use of **logophoric pronouns**. These typically occur in the subject position of clauses that are complements of verbs of saying, perception, cognition, etc., and indicate the person from whose point of view the proposition expressed is presented. Here is an example from Clements (1975: 142), cited in König and Siemund (2000):

(10) Kofi be yè-dzo
Kofi say LOG-leave
"Kofi said that he (=Kofi) left."

(11) Kofi be e-dzo
Kofi say 3.SG-leave
"Kofi said that he/she (≠Kofi) left."

In (10) the logophoric element *yè* indicates that the subject of the subordinate clause is to be interpreted as the same as the subject of the main clause, while no such interpretation is required for (11).

Examples of interface systems are **tense**, **aspect**, and **mood**. Tense is the way a language grammaticalizes (encodes) the real-world concept of time. Aspect is concerned with the way a particular event is viewed as progressing in time, while mood is the way a grammar encodes concepts such as necessity, possibility, permission, uncertainty, etc.

Voice is an example of an information–ordering system. Compare the two sentences below:

(12) The invaders demolished all the churches

(13) All the churches were demolished by the invaders.

These sentences have the same meaning (i.e., they express the same proposition), but differ in the way the components are presented. Thus (12) is more likely in a situation where the invaders have already been mentioned in the preceding cotext, and the churches represent new information, while in (13) it is the other way round.

As before, different languages make different uses of the systems of grammar.

Grammar Models

As noted at the beginning of this article, this overview of grammar is not wholly uncontroversial. In linguistic science, a large number of grammar models exist, among them Transformational Generative Grammar, Cognitive Grammar, (Radical) Construction Grammar, Head-Driven Phrase Structure Grammar, Lexical-Functional Grammar, and Dependency Grammar. These are discussed in separate articles.

Grammar, Early Medieval

A Luhtala, University of Finland, Helsinki, Finland

© 2006 Elsevier Ltd. All rights reserved.

This article deals with the development of language studies from about 600 to 1100, a period which is conveniently divided into two by the Carolingian Renaissance (ca. 800 A.D.). The first medieval centuries are properly the Age of Grammar, whose method had established itself as an indispensable tool for Bible study. The study of dialectic and rhetoric were revived in the Carolingian reform, whereby the scheme of the Seven Liberal Arts was reinforced as the basis of secular learning. Medieval scholars held a unified approach to the study of the Liberal Arts, whose methods were in a constant interaction with each other and with theology.

In the Carolingian Renaissance, the dialectic began to receive an increasingly important role as a general tool of study relevant for all learning, both secular and religious. The dialectical method influenced the study of grammar in a manner that became fundamental for medieval culture. The origins of this development, which culminated in the speculative

Parsing and Grammar Description, Corpus-Based

Introduction: Corpus-Based Investigations of Grammar and Use

English teachers and textbook authors often rely on their intuitions to choose the most important words and grammatical structures to focus on. For example, many English-language professionals believe that progressive aspect verbs (or 'the present continuous', e.g., *is working*) are much more common in conversation than simple aspect verbs (e.g., *works*). As a result, the teaching of progressive aspect has often been emphasized at the expense of simple aspect. However, empirical corpus studies show that such intuitions about language use are often incorrect. The present article introduces corpus analyses of grammar, illustrating the surprising research findings that result from this approach.

There have been numerous studies of grammar and use over the past two decades as researchers have come to realize that the description of grammatical function is as important as structure. In most cases, these studies focus on grammatical features that have two or more structural or semantic variants. By studying these features in naturally occurring discourse, researchers have been able to identify systematic differences in the functional use of each variant.

Functional research of this type became popular in the late 1970s and 1980s (see, e.g., Prince [1978] on the discourse functions of *wh*-clefts and *it*-clefts; Thompson on detached participial clauses [1983] and adverbial purpose clauses [1985]; and Schiffrin on verb tense [1981] and causal sequences [1985]). More recently, researchers on discourse and grammar have begun to investigate similar research questions, using the tools and techniques available from corpus linguistics, with its greater emphasis on the representativeness of the database and its computational tools for investigating distributional patterns in large text collections (for introductions to this analytical approach, see Biber *et al*., 1998; Kennedy, 1998; Meyer, 2002; Hunston, 2002).

The corpus-based research approach has resulted in several books dealing with particular grammatical issues in English (see, e.g., Tottie, 1991, on negation; Collins, 1991, on clefts; Mair, 1990, on infinitival complement clauses; Meyer, 1992, on apposition; Geisler, 1995, on relative infinitives; Johansson, 1995, on relativizers; Mindt, 1995, on modal verbs; Hunston and Francis, 2000, on pattern grammar; Rohdenburg and Mondorf, 2003, on grammatical variation; and Lindquist and Mair, 2004, on grammaticalization). Corpus-based analysis also provided the basis for the *Longman grammar of spoken and written English* (LGSWE; Biber *et al*., 1999), the first comprehensive reference grammar of English to systematically describe the grammatical patterns of variation and use in addition to structural aspects (see also the accompanying student grammar and workbook, Biber *et al*., 2002, and Conrad *et al*., 2002).

In some respects, early studies of grammar and discourse might be regarded as corpus-based investigations: they were empirical studies, based on analysis of grammatical variation in actual texts and combining quantitative and qualitative techniques. However, there was usually relatively little concern with the generalizability of the text sample in these earlier studies. Many of them used a 'convenience' sample – a collection of texts that was readily available to the researcher – with the implicit assumption that any sample of naturally occurring discourse would illustrate the same patterns of use.

In contrast, a key factor underlying recent corpus-based studies of grammar is the representativeness of the corpus itself. Two considerations are crucial for corpus design: size and composition (see Biber, 1993; Biber *et al*., 1998: 246–250). First, corpora need to be large enough to accurately represent the distribution of linguistic features; to study less-common features, including the use of individual words, a corpus should have hundreds of texts and many million words. The second consideration is equally important: the texts in a corpus should be deliberately chosen to represent particular registers (and dialects).

This article illustrates the importance of register for studies of grammar and use. It turns out that most functional descriptions of a grammatical feature are not valid for the language as a whole. Rather, characteristics of the textual environment interact with register differences, so that strong patterns of use in one register often represent only weak patterns in other registers. Thus, a complete functional analysis must consider the patterns of use across registers.

The following sections illustrate the interaction of grammar, use, and register with corpus-based analyses adapted from the *Longman grammar of spoken and written English* (Biber *et al*., 1999). Three case studies are presented, all of which focus on the use of verbs. These case studies illustrate the application of different research methodologies, together with the study of language use at different linguistic levels, as in Table 1.

Table 1 Overview of case studies

Case study	*Research methodologies*	*Linguistic level*
most common lexical verbs	POS-tagged corpus + database of all lexical verbs	lexical + part of speech
verb aspect: register distribution	grammatically-tagged corpus	grammatical
verb valencies	grammatical/syntactic-tagged corpus + interactive analysis	lexico-grammatical

Table 2 Composition of the subcorpora used in the analyses (taken from the LSWE Corpus; see Biber *et al.*, 1999: 24–35)

	Number of texts	*Number of words*
Conversation (BrE)	3436	3 929 500
Fiction (AmE and BrE)	139	4 980 000
News (BrE)	20 395	5 432 800
Academic prose (AmE and BrE)	408	5 331 800

The analyses are based on texts from four registers: conversation, fiction, newspaper language, and academic prose. Although these are general registers, they differ in important ways from one another (e.g., with respect to mode, interactiveness, production circumstances, purpose, and target audience). The analyses were carried out on the Longman Spoken and Written English (LSWE) Corpus, which contains c. 40 million words of text overall, with c. 4–5 million words from each of these four registers (see Table 2). All frequency counts reported in this article have been normalized to a common basis (a count per 1 million words of text) so that they are directly comparable across registers.

Computational Analysis of Grammatical Features in Corpora

In the LGSWE, corpus-based investigations of grammatical features were carried out using a variety of computational, interactive, and detailed 'manual' textual analyses. In all cases, the overarching concern was to achieve an accurate description of the distributional patterns of the target grammatical feature. Computational techniques made it feasible to analyze the patterns of use in a 20-million-word corpus. However, whenever automatic techniques produced skewed or inaccurate results, we shifted to interactive analyses or even manual analyses carried out on random subsamples of texts from each register. The guiding principles were to achieve an accurate grammatical description efficiently, using whatever techniques were required for that purpose, based on the most representative sample of corpus texts that could reasonably be analyzed. (In contrast, the focus of NLP projects is usually on the computational tools, rather than the grammatical description itself.)

As the first step for the grammatical analyses, we 'tagged' the entire LSWE Corpus, assigning codes for many grammatical features (such as 'plural common noun' and 'past-tense lexical verb'). The tagger, developed by the author for previous corpus-based studies, has both probabilistic and rule-based components, uses multiple large-scale dictionaries, and runs under Windows. This tagger achieves accuracy levels comparable to other existing taggers, but it is more robust than many taggers (with different probabilistic databases and rules for 'oral' versus 'literate' texts), and it analyzes a larger set of linguistic characteristics than most other taggers (e.g., distinguishing simple past tense, perfect aspect, passive voice, and postnominal modifier for past participle verbs; identifying the gap position for *wh-* relative clauses; identifying several different kinds of complement clause and the existence of *that-* complementizer deletion). In addition to the LGSWE, the tagger had been used previously for many large-scale corpus investigations, including multidimensional studies of register variation (e.g., Biber, 1988, 1995) and a major study of university spoken and written registers for the Educational Testing Service (Biber *et al.*, 2004). A number of more specific computational tools were developed for the LGSWE project, including programs to analyze specific linguistic variants and databases to create frequency lists (such as the verbs or adjectives found to be most common in the corpus).

Many analyses were complicated by the existence of ambiguous lexical items. It is often the most common words that serve the greatest range of functions. For example, the forms *get*, *go*, and *see* are some of the most common words in English, but each of these forms can function as a lexical verb (transitive or intransitive), as a copular verb (e.g., *go bad*), as part of a fixed discourse phrase (e.g., *you see*), or as part of a semimodal verb (have *got to*, be *going to*). The word *like*, also very common as a lexical verb, is even more flexible in the range of other functions it serves (including preposition, conjunction, and adverbial hedge). For other features, the grammatical variants in question relate to meaning distinctions and thus require a human analyst.

For example, one analysis in the LGSWE required identification of animate versus inanimate nouns, to investigate the use of activity and communication verbs with inanimate subjects in academic prose (e.g., *social science and the arts make contributions*; *crop residues provide breeding sites*; *these findings suggest that convergence may influence sequence*

Figure 1 Frequencies in conversation of the most common lexical verbs (based on Biber *et al.*, 1999, Figure 5.9).

similarity). Although the most obvious animate nouns could be identified automatically, this analysis was carried out manually to ensure accurate identification of animacy. A second example involved the meaning distinctions associated with modal verbs. For example, the modal *must* can express personal obligation (*Students must turn in the exam to me before leaving class*) or logical necessity (*You must feel cold now*). It turns out, surprisingly, that the personal meanings of *must* are especially common in academic writing, while the logical meanings are prevalent in conversation (see Biber *et al.*, 1999: 493–495). Although detailed collocational information helps to disambiguate these uses, automatic analyses are generally unreliable for investigations of this type.

To ensure accurate descriptions of the patterns of use for such features, interactive software was developed to code corpus samples. These programs work in a similar way to a spelling checker in a word processor: the program automatically provides a 'best guess,' which is often correct, but all codes are checked and corrected (if needed) by a human analyst. In addition, concordancing software was used to confirm and revise (if needed) all automatic analyses.

Case Studies from the LGSWE

The Most Common Lexical Verbs across Registers

One area of research for the LGSWE was to identify the most common lexical verbs in each register and to compare the patterns of use across registers. With the part-of-speech–tagged LSWE Corpus, it was easy to identify all lexical verbs. (As stated earlier, several aspects of the tagging itself must be checked, though.) A simple program created a database of all lexical verbs and computed frequency counts for each verb in each register. The last step, then, was to compute normalized rates of occurrence (per million words) and output lists of the most common verbs in each register.

It turns out that there are literally dozens of common lexical verbs in English. For example, nearly 400 different verb forms occur more than 20 times per million words in the LSWE Corpus (see Biber *et al.*, 1999: 370–371). These include many everyday verbs, such as *pull*, *throw*, *choose*, and *fall*.

Given this large inventory of relatively common verbs, it might be easy to assume that that no individual verbs stand out as being particularly frequent. However, that is not at all the case: there are only 63 lexical verbs that occur more than 500 times per million words in a register, and only 12 verbs occur more than 1000 times per million words in the LSWE Corpus (Biber *et al.*, 1999: 367–378). These 12 most common verbs are *say*, *get*, *go*, *know*, *think*, *see*, *make*, *come*, *take*, *want*, *give*, *mean*.

It further turns out that there are large frequency differences among these 12 verbs, overall and in their register distributions. For example, Figures 1 and 2 plot the frequency of each verb in conversation and in newspaper language (cf. Biber *et al.*, 1999: 374–376). The verb *say* is listed first in these figures

because it is common in both spoken and written registers and thus has the highest frequency overall. This is not surprising, given the ubiquitous need to report the speech of others; it turns out that both speakers and writers rely heavily on the single verb *say* for this purpose, usually in the past tense and expressing either a direct or indirect quote. For example:

(1) You *said* you didn't have it. (Conversation)

(2) He *said* this campaign raised 'doubts about the authenticity of free choice'. (News)

The extremely high frequency of the verb *get* in conversation is more surprising. This verb goes largely unnoticed, yet in conversation it is by far the single most common lexical verb in any one register. The main reason *get* is so common is that it is extremely versatile, being used with a wide range of meanings. For example:

(3) Obtaining something:
See if they can *get* some of that beer. (Conv)

(4) Possession:
They've *got* a big house. (Conv)

(5) Moving to or away from something:
Get in the car. (Conv)

(6) Causing something to move or happen:
It *gets* people talking again, right? (Conv)

(7) Understanding something:
Do you *get* it? (Conv)

(8) Changing to a new state:
So I'm *getting* that way now. (Conv)

Several other verbs are also extremely common in conversation: *go*, *know*, and, to a lesser extent, *think*, *see*, *come*, *want*, and *mean*. News, on the other hand, shows a quite different pattern, with only the verb *say* being extremely frequent. However, all 12 of these verbs are very common in both registers in comparison to most verbs in English. For example, as noted above, verbs like *pull*, *throw*, *choose*, and *fall* occur only about 50–100 times per million words. Countless other verbs have even lower frequencies. In contrast, the majority of the 12 most common verbs occur more than 1000 times per million words in both conversation and news.

To give an indication of the overall importance of these 12 verbs, Figure 3 plots their combined frequency compared with the overall frequency of all other lexical verbs. Figure 3 shows that there are dramatic differences across registers in the use of these verbs. Taken as a group, these 12 verbs are especially important in conversation, where they account for almost 45% of the occurrences of all lexical verbs. In contrast, in academic prose these verbs account for only c. 10% of all lexical verb tokens. This general pattern is found for other word classes as well, in that conversation uses relatively few word forms with extremely high frequencies, and academic writing uses a much larger set of different word forms, but no individual word occurs with high frequency.

Figure 2 Frequencies in news of most common lexical verbs (based on Biber *et al.*, 1999, Figure 5.11).

Simple, Progressive, and Perfect Aspect across Registers

Verb aspect is an area of language use that is coded by many taggers and can thus be easily studied using a tagged corpus. For regular verbs, progressive aspect and perfect aspect are readily identified by the presence of the auxiliary verb (*be* or *have*) followed by a participle form (*-ing* or *-ed*). (Taggers also need to allow for the presence of intervening adverbs or *not*, as in *are not actually happening*). Most taggers incorporate lists of the irregular past-participle verbs, making identification of perfect aspect for these forms also straightforward (e.g., *have seen*, *had made*). Simple aspect verb phrases are the unmarked formal alternative; if a tagger accurately identifies all verbs, the simple-aspect verb phrases are the verbs that are not identified as progressive aspect or perfect aspect.

The corpus-based study of verb aspect is interesting because the actual patterns of use run directly counter to prior expectations. One of the most widely held intuitions about language use among English-language professionals is the belief that progressive aspect is the unmarked choice in conversation. One reflection of this belief is the prominent coverage given to progressive aspect verbs (the 'present continuous') in most ESL grammar textbooks (see Biber and Reppen, 2002).

As Figure 4 shows, the generalization that progressive aspect is more common in conversation than in other registers is correct. The contrast with academic prose is especially noteworthy: progressive aspect is rare in academic prose but common in conversation. The overall register distribution is somewhat surprising, in that progressive verb phrases are nearly as common in fiction as in conversation, and they are relatively common in news as well.

However, when we compare the use of progressive aspect with the use of simple aspect, we see that progressive aspect is certainly not the unmarked choice in conversation. Rather, as Figure 5 shows, simple aspect is clearly the unmarked choice, occurring more than 20 times more often than progressives in conversation. The following excerpt illustrates the normal reliance on simple aspect in natural conversation:

B: – What *do* you do at Dudley Allen then?
A: What the school?
B: Yeah. *Do* you –
A: No I'*m*, I'*m* only on the PTA.
B: You'*re* just on the PTA?
A: That'*s* it.
B: You *do*n't actually *work*?
A: I *work* at the erm –
B: I *know* you *work* at Crown Hills, *do*n't you?
A: Yeah.

In contrast, progressive aspect is used for special effects, usually focusing on the fact that an event is in progress or about to take place. For example:

(9) What'*s* she doing? (Conv)

(10) But she'*s* *coming* back tomorrow. (Conv)

With nondynamic verbs, the progressive can refer to a temporary state that exists over a period of time, as in:

Figure 3 Distribution of the most common lexical verbs vs. other verbs, across registers (based on Biber *et al.*, 1999, Figure 5.8).

(11) I *was looking* at that one just now. (Conv)

(12) You should *be wondering* why. (Conv)

(13) We *were waiting* for the train. (Conv)

A few lexical verbs actually occur most of the time with the progressive aspect in conversation. These include *bleeding*, *chasing*, *shopping*, *starving*, *joking*, *kidding*, and *moaning* (see Biber *et al.*, 1999: 471–475). However, the norm – even in conversation – is to express verbs with the simple aspect.

The Interaction of Lexicogrammatical and Register Factors

The previous sections of this article illustrate the unexpected lexical and grammatical patterns of use that can be uncovered by corpus-based research. It further turns out that there are often complex interactions between word sets and grammatical variation. Such lexicogrammatical associations usually operate well below the level of conscious awareness, yet they are highly systematic and important patterns of use. In this section, I illustrate these associations through a comparison of the valency patterns for *stand*, *begin*, and *try* (see also Biber *et al.*, 1999: 380–392; Biber *et al.*, 1998: 95–100).

Many verbs take only a single valency pattern. For example, *wait*, *happen*, and *exist* occur only as intransitive verbs, while verbs like *bring*, *carry*, *suggest*, and *find* occur only as transitive verbs. However, there are many other verbs in English that can occur with multiple valency patterns, such as *eat*, *watch*, *help*, and *change*.

Stand, *begin*, and *try* are three verbs that have exactly the same potential for occurring with multiple valency patterns – all three verbs can occur with four different patterns.

(14) Simple intransitive (SV):
For a while he *stood* and watched. (Fict)
A number of adults and children have left the compound since the siege *began*. (News)
Well, we can *try*. (Conv)

(15) Intransitive with an optional adverbial (SV+A):
I just *stood* there. (Conv)
This effort *began* in January of 1981. (Academic prose)
I actually *tried* really hard on that paper. (Conv)

(16) Transitive with a noun phrase as direct object (SVO (NP)):
My mom couldn't *stand* it in the end. (Conv)
Mr. Hawke's government has *begun* its controversial plan to compensate the three main domestic airlines. (News)
I *tried* that one time. (Conv)

(17) Transitive with a complement clause as direct object (SVO (Comp-cls)):
I could hardly *stand* to watch that movie. (Conv)
He *began* to scratch slowly in the armpit of his alpaca jacket. (Fict)
I didn't *try* to hide it. (Conv)

A traditional grammatical description would simply note that all these verbs occur with the same

Figure 4 Frequency of present progressive and past progressive in four registers (based on Biber *et al.*, 1999, Figure 6.4).

four valency patterns. However, corpus-based analysis opens up the possibility of a use perspective on such points of grammar. Earlier sections of this article show how the use of grammatical features is conditioned by register; the present section shows how the use of grammatical patterns is conditioned by individual words (which is in turn conditioned by register).

It turns out that these three verbs have strikingly different preferred valency patterns, despite their identical valency potentials. Figure 6 shows the proportional use of each verb with each valency, comparing the patterns of use in conversation and newspapers. *Stand* usually occurs as an intransitive verb, often with an optional adverbial, while *begin* is more common with transitive patterns (especially with a following complement clause). The verb *try* has an even stronger preference for a following complement clause than *begin*.

Further, there are important register differences. For example, the pattern *begin* + complement clause is especially characteristic of conversation, while intransitive *begin* is more likely to occur in news and academic prose. (Note that this pattern runs contrary to the general intuition that dependent clauses are typical of formal writing but rare in conversation.)

These register differences reflect different typical functions. In conversation, *begin* usually has an aspectual function, marking the initiation of the action in the *to*-clause.

(18) Yeah, I couldn't *begin* to do this yesterday. (Conv)

(19) We're slowly *beginning* to see what he meant by that. (Conv)

(20) And then it *began* to get a bit darker. (Conv)

In contrast, *begin* is usually used in newspaper reportage and academic writing to identify the starting point of some event, organization, or institution, as in (21) and (22).

(21) The service *began* in Southwestern Bell Telephone's five-state territory in June. (News)

(22) The government pledged to open a top-level investigation into rioting last week that *began* during a nationwide general strike. (News)

In contrast, the predominant use of *stand* as an intransitive verb corresponds to its typical meaning marking a physical state, as in (23) and (24).

(23) I just sort of have to *stand* there while you two *stand* there laughing at me. (Conv)

(24) He *stood* alone in the empty hall. (Fict)

In this case, the relatively rare transitive pattern has a completely different meaning that could be paraphrased as *tolerate*; transitive *stand* is usually used in a negative context, to indicate what the speaker cannot tolerate, as in (25) and (26).

(25) Everybody in the break room can't *stand* her. (Conv)

Figure 5 Frequency of simple, perfect and progressive aspect in four registers (based on Biber *et al.*, 1999, Figure 6.2).

Figure 6 Proportional use of valency patterns for three verbs: *stand*, *begin*, and *try* (based on Biber *et al.*, 1999, Table 5.5).

(26) I couldn't *stand* to listen to him. (Conv)

In sum, corpus analysis in this case enables description of the different ways in which verbs are actually used. That is, although verbs often have the same potential for different valency patterns, corpus analysis makes it clear that the actual use of such verbs is highly systematic, with each verb's having its own preferred patterns, depending on its typical meanings and functions.

Conclusion

Corpus analyses of grammar are not likely to contribute to theoretical discussions of formal syntax, and they rarely uncover new grammatical devices that were not noticed before. Rather, the major contribution of corpus-based analysis is to study the actual patterns of language use, investigating the highly systematic patterns that structure our everyday use of grammatical features in speech and writing. These kinds of patterns operate below the level of conscious awareness and are usually not accessible to native intuitions. As a result, these patterns often went unnoticed prior to corpus-based study. However, as the analyses in this article illustrate, these important patterns correspond to major differences among sets of words, grammatical variants, and lexicogrammatical associations – and all these are distributed in systematic ways across registers.

Parsing: Statistical Methods

D Klein, University of California at Berkeley, Berkeley, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

Overview

Statistical parsing, broadly, is the use of statistical methods to resolve tree-level syntactic ambiguities. Most work in theoretical syntax investigates grammaticality: the distinction between what we can or cannot say in a given language. In contrast, statistical parsers model the trends of what we do or do not say in practice, using these trends to resolve syntactic ambiguities, such as prepositional phrase attachment, relative clause attachment, and coordination scope. For example, in a phrase like *increases in economic indicators and decreases in exchange rates*, the second prepositional phrase can grammatically modify both conjuncts, but probably does not. While some utterances are deeply ambiguous, most are not, and therefore good statistical models can resolve most potential ambiguities correctly. In computational systems, it is useful to model syntactic trends because many syntactic ambiguities have semantic reflexes, and therefore syntactic models can constrain semantic interpretation.

Statistical parsers are systems which take sentences as input and produce syntactic analyses of those sentences as output. The outputs produced vary in richness from parser to parser. On the impoverished end of the spectrum, there are chunkers, which might only attempt to bracket simple nonrecursive noun phrases. Chunkers are sufficiently low-level that they often have more in common with part-of-speech taggers than with full parsers, which produce nested hierarchical structures. On the rich end, some parsers operate over detailed, feature-structured linguistic formalisms such as HPSG and LFG. Most parsers produce something in between, usually context-free phrase structure trees. Statistical parsers can either

may have informal and polite forms, such as French *tu/vous*, German *du/Sie*, Dutch *jij/U*, etc. Some languages (especially in Africa) make use of **logophoric pronouns**. These typically occur in the subject position of clauses that are complements of verbs of saying, perception, cognition, etc., and indicate the person from whose point of view the proposition expressed is presented. Here is an example from Clements (1975: 142), cited in König and Siemund (2000):

(10) Kofi be yè-dzo
Kofi say LOG-leave
"Kofi said that he (=Kofi) left."

(11) Kofi be e-dzo
Kofi say 3.SG-leave
"Kofi said that he/she (≠Kofi) left."

In (10) the logophoric element *yè* indicates that the subject of the subordinate clause is to be interpreted as the same as the subject of the main clause, while no such interpretation is required for (11).

Examples of interface systems are **tense**, **aspect**, and **mood**. Tense is the way a language grammaticalizes (encodes) the real-world concept of time. Aspect is concerned with the way a particular event is viewed as progressing in time, while mood is the way a grammar encodes concepts such as necessity, possibility, permission, uncertainty, etc.

Voice is an example of an information–ordering system. Compare the two sentences below:

(12) The invaders demolished all the churches

(13) All the churches were demolished by the invaders.

These sentences have the same meaning (i.e., they express the same proposition), but differ in the way the components are presented. Thus (12) is more likely in a situation where the invaders have already been mentioned in the preceding cotext, and the churches represent new information, while in (13) it is the other way round.

As before, different languages make different uses of the systems of grammar.

Grammar Models

As noted at the beginning of this article, this overview of grammar is not wholly uncontroversial. In linguistic science, a large number of grammar models exist, among them Transformational Generative Grammar, Cognitive Grammar, (Radical) Construction Grammar, Head-Driven Phrase Structure Grammar, Lexical-Functional Grammar, and Dependency Grammar. These are discussed in separate articles.

Grammar, Early Medieval

A Luhtala, University of Finland, Helsinki, Finland

© 2006 Elsevier Ltd. All rights reserved.

This article deals with the development of language studies from about 600 to 1100, a period which is conveniently divided into two by the Carolingian Renaissance (ca. 800 A.D.). The first medieval centuries are properly the Age of Grammar, whose method had established itself as an indispensable tool for Bible study. The study of dialectic and rhetoric were revived in the Carolingian reform, whereby the scheme of the Seven Liberal Arts was reinforced as the basis of secular learning. Medieval scholars held a unified approach to the study of the Liberal Arts, whose methods were in a constant interaction with each other and with theology.

In the Carolingian Renaissance, the dialectic began to receive an increasingly important role as a general tool of study relevant for all learning, both secular and religious. The dialectical method influenced the study of grammar in a manner that became fundamental for medieval culture. The origins of this development, which culminated in the speculative

grammars of the 13th century, have only recently been traced back to the Carolingian reform. It was then that Priscian's *Institutiones grammaticae* entered into circulation, and began to receive philosophical commentary.

Elementary pedagogical grammar continued to flourish, and exegetical work was pursued as focused on Donatus's two grammars, *Ars minor* and *Ars maior*. Grammatical commentaries were developed in parallel with biblical exegesis, especially by Irish scholars. Furthermore, the question of Christian grammar continued to be relevant throughout the early medieval period. Grammar held a propaedeutic position in the medieval curriculum as an art by means of which one would proceed towards something higher, as emerges from Isidore of Seville's popular definition, "grammar is an art of correct speaking and the first of the Liberal Arts and the foundation of them all."

The Liberal Arts

The Seven Liberal Arts was an educational program that medieval scholars inherited from Late Antiquity and gave a thoroughly Christian interpretation. Before the birth of the universities, the Liberal Arts were regarded as the standard basis of general education and as an ideal form of universal knowledge. They were studied through encyclopedic works, which presented the basic doctrine of each Liberal Art in a concise and systematic manner. The most popular encyclopedias in the 6th and 7th centuries were Cassiodore's *Institutiones humanarum et divinarum litterarum* and Isidore's *Origines sive Etymologiae*; Martianus Capella's *De Nuptiis Mercurii et Philologiae* gained in popularity during and after the Carolingian reform. The Liberal Arts consisted of two parts; one dealt with the three linguistic and logical arts: grammar, rhetoric, and dialectic; while the other covered the four mathematical disciplines: arithmetic, geometry, astronomy, and music. Only the arts of discourse, known as the *trivium* in the Middle Ages, were studied independently before the 12th-century Renaissance, whereas the mathematical disciplines of the *quadrivium* were known through encyclopedias.

The Late Latin Inheritance

Early medieval scholars inherited a large number of grammars from Late Antiquity, which can roughly be divided into the following types:

1. The *artes*-type grammars present the doctrine of the parts of speech in a systematic manner. They concentrate on providing concise definitions of the eight parts of speech – or only a couple of them – and presenting their salient morphological and semantic properties, known as the 'accidents.' The length of these works vary. Donatus's *Ars minor* is by far the most concise of these grammars; his more advanced *Ars maior* dealt additionally with letters, syllables, and metrical feet, as well as grammatical errors (barbarisms, solecisms, etc.) and stylistic figures. Works of great length are those by Consentius, Diomedes, and Charisius.
2. Grammatical commentaries began to emerge in the 4th century as soon as Donatus's two works had come into existence. Donatus discussed the parts of speech in an authoritative manner, without providing any justifications for the doctrine, which therefore required explanation. Within the exegetical genre, commentators dealt with material that was absent from Donatus's grammar and which was covered in the more comprehensive *Artes grammaticae*. Such material includes, for instance, the etymological definitions of the parts of speech, the justifications for the order of their presentation, etc. Until the mid-9th century, commentaries focused solely on Donatus's works, but in the 9th century, other grammatical works also became the object of commentary, e.g., Eutyches, Phocas, and, most importantly, Priscian's *Institutiones grammaticae*.
3. The *regulae*-type of grammars concentrate on the formal features of one or more parts of speech and especially on the analogical patterns (*regulae*) of Latin inflection. Representatives of this genre include Eutyches, Phocas, Pseudo-Augustine, Martianus Capella, and Pseudo-Palaemon. Their works are collections of morphological paradigms, ordered alphabetically or otherwise, and completed with lists of examples. The structure and coverage of the *regulae*-type grammars – they may be restricted to the presentation of a couple of parts of speech – are such that they lend themselves less easily to pedagogical use. Many large grammars such as those of Priscian, Charisius, Diomedes, and Consentius combined various aspects by incorporating portions of the *regulae*-type material into the structure of an *ars grammatica*.

During the first medieval centuries, three works could claim to be universally known, namely Donatus's *Ars minor* and *maior*, as well as one of Priscian's minor works, *Institutio de nomine*, *de pronomine*, *de verbo*. The latter sets out a formally based system of classification of the inflecting parts of speech. The fates of the other Late Latin grammars during the

early Middle Ages can be related to the question of to what extent these grammars served to complete or supplement Donatus's grammars. In a situation where his two grammars provided an outline of the essential doctrine in a concise manner, it is unlikely that very short grammars of a similar kind could have competed in any way with the grammars of Donatus. Such short grammars as those of Asper, Dositheus, or Scaurus seem indeed to have fallen into disuse during the first medieval centuries, and only a sporadic use can be attested to St. Augustine's *Ars breviata* and to the grammar of Audax. An exception to this rule is the widely used grammar of Maximus Victorinus. By contrast, the comprehensive grammars of Charisius, Diomedes, and Consentius, combining aspects of both types of grammar, enjoyed considerable popularity. Out of a variety of *regulae*-type of grammars, Eutyches was the one to gain general popularity, while the use of Phocas was restricted to a few authors.

Insular Elementary Grammars

Early medieval developments of grammar are primarily associated with the British Isles, where a large number of pedagogical and exegetical grammars were produced during the first medieval centuries. By contrast, very little is known of grammar teaching on the Continent until the 7th century, when Isidore's *Etymologiae* appeared (636). This arrival may be because a more immediate need for rearrangement in the teaching material was felt by the recently converted people in northern Europe, who had to learn Latin as a foreign language. In the areas where contact with the Latin language had been more direct, the Late Latin grammars largely satisfied the needs of language teaching.

For a foreign student of Latin, all the Classical grammars would present certain difficulties – the most obvious defect being the poor coverage of Latin morphology. In his *Ars minor*, Donatus illustrates noun declension by five examples, which he chose on the basis of gender, and his treatment of the verb inflection is exhausted by one example only, namely the verb *legere* 'read.' On the other hand, the noun declensions were presented more elaborately in the *regulae*-type grammars, which used an unhelpful principle such as alphabetical order to organize them.

The main efforts of the Insular grammarians were focused on providing fuller presentations of the inflecting parts of speech. The discussion of nominal declensions is predominant, whereby the method of presenting them by declension rather than gender establishes itself, for instance in the grammars of Tatwine (d. 734) and Boniface (d. 754). It is also characteristic of Insular grammars to assign an important place to Christian vocabulary in the paradigms and the accompanying examples. The Insular grammarians felt free to rework their sources, combining and expanding them and eliminating unnecessary elements to their liking. This policy is made explicit by Boniface, who states that he never speaks on his own authority: "Not a single twig of a rule will be found grafted into this little book which is not firmly rooted in one of the Classical grammarians" (Law, 1982). The Insular tendency to concentrate on the formal features of the parts of speech found its strongest expression in the texts called *Declinationes nominum* or *Coniugationes verborum*. Such texts, which consist of collections of paradigms and examples, began to circulate at the end of the 7th century. The results of these wide-ranging experiments in describing Latin morphology entered the mainstream of elementary grammars, even though the Insular grammars themselves went out of use by the middle of the 9th century.

Christian Grammar

Grammar had been intimately associated with the study of pagan literature in ancient schools, and the use of secular arts in Christian education had to be justified over and over again by early medieval teachers. In their defense of grammar, they appealed to the authority of the early Church Fathers, and especially to Augustine, whose various works (*De doctrina christiana*, *De ordine*) were highly influential in legitimizing the use of the secular arts for Christian purposes. It was also important to assert the authority of the Bible over that of Donatus: the divine text of the *Vulgate* could not contain errors, it was unanimously maintained, and should therefore not be emended according to the rules of grammar.

It was commonplace in the medieval exegesis to think that the sacred text required special tools of interpretation. As a result of the Fall, God had ceased to speak to man directly; the Bible, on the other hand, speaks of spiritual issues obliquely, through enigmas. Thus, in addition to the literal or historical sense, the sacred text contains a deeper meaning, which was analyzed in terms of various figurative senses, allegorical (or spiritual), tropological (or moral), and anagogical (or prophetic). Whenever the sacred text appeared to contain something obscure or contradictory, it was not to be understood literally, but as an enigma, which required interpretation. The Christian use of the rhetorical tropes and figures was made legitimate in Augustine's *De doctrina christiana*, and in his footsteps, Bede claimed that the Christians used them before the Greeks. For instance, the majority of

the examples in his *De schematibus and tropis* come from Christian contexts.

One area that lent itself easily to Christianization was the body of examples drawn from Classical literature. The practice arose to replace – at least partly – the manifestly pagan examples with Christian ones, the earliest specimen of this approach being the *Ars Asporii* (or *Asperi*) from late 6th century Gaul. The anonymous author of this text is supposed to have depended on a widely known Christianized version of the *Ars maior*. The most striking example of Christian grammar is that of Smaragdus from the early 9th century, where 750 Biblical examples are used, of which about three-quarters come from the Old Testament.

A religious attitude to language study is also present in the two enigmatic works of Virgilius Maro Grammaticus, *Epistolae* and *Epitomae*. Virgilius, too, looked upon the grammatical text as a bearer of a deeper meaning, parallel to the sacred texts, but his message was less clear than that of Smaragdus, for instance. These works, long regarded as a parody of the pompous style of the Latin grammarians, have recently been open to a new interpretation. According to Law (1995), Virgilius was something of a heretic, one who defended the independent study of natural phenomena and the possibility of multiple ways to divine wisdom against the authoritative statements of various Christian figures (who had condemned the study of the secular arts for their own sake). Virgilius would therefore have hidden his meaning in the alluring complexities of his text.

Exegetical Grammar

Donatus's *Ars maior* became the object of several commentaries, which developed in intimate association with scriptural exegesis. The earliest surviving commentary, known as *Quae sunt quae omnem veritatem scripturae commendant*, displays many of the features of Hiberno-Latin Biblical exegesis. The commentary often incorporates quotations from the Church Fathers or the Bible, and seeks a religious interpretation for grammatical phenomena. It introduces the author, Donatus, and his work by means of a threefold introductory scheme based on the *locus*, *tempus*, *persona* and sometimes even the *causa scribendi*. The principal sources of this commentary are Pompeius and Consentius. Two Insular commentaries cover a few parts of speech only; *Aggressus quidam* is a brief text reworking the noun-section of the *Ars maior*, and *Ars Malsachani* is a long tract on the verb and participle. The Irish author makes use of a wide variety of Classical sources, including works by Consentius, Diomedes, Charisius, and Sergius, plus Priscian's *Institutio de nomine de pronomine et de verbo* and the works of Donatus.

A glimpse of the grammatical exegesis from the Mediterranean world in the 6th or 7th century is probably offered by the *Ars Ambrosiana*. This anonymous *Ars maior* commentary lacks most of the features characteristic of the Insular exegetical grammars; it fails to introduce Christian elements into the grammar and draws upon a group of sources that would be unusual for an Insular author: works by Pompeius, Consentius, Charisius, Diomedes, Maximus Victorinus, Sergius, Priscian, and Claudius Sacerdos, and also possibly Sergius' *Explanationes* I.

The Irish on the Continent, the *scotti peregrini*, seem to have introduced this type of pedagogy to the Carolingian schools. Several of their commentaries on the *Ars maior* survive from the early and mid-9th century (e.g., Murethach, Sedulius Scottus, the anonymous works known as the *Ars Laureshamensis* and *Ars Brugensis*). Commentaries were focused even on authors other than Donatus. For instance, Sedulius Scottus wrote commentaries on Eutyches, Phocas, and Priscian's *Institutiones grammaticae*. Towards the end of the 9th century, Remigius of Auxerre (d. ca. 908) commented upon a large number of authors, ranging from Vïrgil to Martianus Capella, Boethius, and Bede. Among the grammars that he commented upon are Donatus's two works, those of Eutyches, plus Phocas's and Priscian's minor works.

When the study of dialectic was revived in the Carolingian Renaissance, its method began to influence grammatical exegesis immediately. The commentators became increasingly aware of the presence of philosophical categories in the ancient *ars grammatica*, which were reminiscent of the Aristotelian categories. Such material became the object of meticulous analysis. One area that lent itself easily to philosophical elaboration were the definitions, which traditionally belonged to the domain of philosophers. Leaning on the philosopher's lists of definitions, the Carolingian grammarians distinguished up to 12 types of definition. Of these, the most common were the *definitio substantiae*, the definition of the essence, and *definitio soni*, the etymological definition; or, else, the commentators resorted to the method of Porphyry's *Isagoge*, asking what each part of speech has in common (*communio*) with the others, and what distinguishes it from every other part (*proprietas*).

Grammar for the *Provecti*

The principal object of philosophical commentary was Priscian's massive *Institutiones grammaticae*, launched into circulation during the Carolingian

Renaissance. Alcuin encouraged the use of the *Institutiones* by compiling *excerpta* based on its last two books, and by incorporating material from it into his own grammar, *Dialogus Franconis et Saxonis de octo partibus orationis*. This grammatical dialogue, which involves two mature pupils, combined the methods of grammar and dialectic in a way which marks the beginning of a more advanced, philosophical grammar in the Middle Ages. Thanks to Alcuin's policy, Priscian's grammar received philosophical commentary immediately. The *Scotti peregrini* made regular use of the *Institutiones* in their Donatus commentaries, and one of Sedulius Scottus' commentaries was focused on *Priscianus maior*.

Priscian's *Institutiones* is a massive compilation of 18 books, which often circulated in two parts in the Middle Ages. The first 16 books, known as the *Priscianus maior*, covers essentially the same topics as does the *Ars maior* – the letters, syllables, the parts of speech, and its descriptive framework is largely similar. Importantly, however, its philosophical semantics is much more explicit than that of Donatus. Moreover, while the *Ars maior* is concluded by a section on style, the last two books of the *Institutiones* contain an account of syntax, known as the *Priscianus minor*. This theory of syntax, which was inspired by Stoic logic, forms the basis of our traditional syntax. This field of grammar was properly developed in the High Middle Ages, but was not totally neglected in the Early Middle Ages either. Alcuin's *excerpta* were based on *Priscianus minor*, and an anonymous Priscian commentator in Paris introduced the subject – predicate distinction into grammatical analysis, using the vocabulary of Martianus Capella. Remarkably independent experimentation in the field of syntax is attested in the so-called St. Gall Tractate. In this anonymous tract, the rhetorician's argumentative *loci*, the Seven Circumstances, together with the methods of grammar and philosophy, provide the tools for syntactical analysis, as applied to a large number of Christian texts. The main concern of this author is the Latin word order.

Some 60 manuscripts of Priscian's principal work derive from the 9th and 10th centuries, most of which received marginal commentary. A number of excerpted versions of this book were compiled: the *excerpta* compiled by Peter of Pisa on the *Priscian maior*, the *Adbreviatio* of Ursus of Beneventum and the anonymous *Excerptiones de Prisciano*. Walahfrid Strabo produced works that combined material from the *Institutiones* with the doctrine of Donatus's *Ars minor* and *Ars maior*. Recently, a full commentary on the *Priscian maior* from the 9th century has been discovered, and attributed to Johannes Scottus Eriugena, the most prominent early medieval philosopher. Eriugena tackles Priscian's philosophical definitions of the parts of speech in a sophisticated manner, interpreting their originally Stoic vocabulary (substance, quality) in terms of the Aristotelian categories. In his principal work, the *Periphyseon*, Eriugena discussed the applicability of these categories to divine issues, and raised the question, in terms of negative theology, of the incapability of the human language to express divine issues.

The exegetical work on Priscian was often carried out anonymously and appears in the margins of the manuscripts. From the 11th century onward, commentaries based on such glosses are found written out continuously. Such are the anonymous commentaries known as the *glosulae*-tradition, whose earliest version has been dated to the latter half of the 11nth century. The central figures of the 12th century grammar, William of Conches (ca. 1125) and Peter Helias (ca. 1140) depended very much on the tradition of the gloss commentaries. It seems, thus, fair to conclude that there was continuity, from the Carolingian reform onwards, in the philosophical commentary on Priscian's *Institutiones grammaticae*.

Grammatical Meaning

Ö Dahl, Stockholm University, Stockholm, Sweden

© 2006 Elsevier Ltd. All rights reserved.

Grammatical meaning is usually seen as opposed to lexical meaning. Grammatical meaning thus ought to include any aspect of linguistic meaning that is due to the grammatical structure of an expression rather than to the choice of lexical items. The variation in the definitions found in the literature suggest, however, that the notion is not wholly well understood. Consider, for illustration, the following sample formulations: 'the part of meaning that varies from one inflectional form to another'; 'the meaning of a word that depends on its role in a sentence'; 'the meaning of an inflectional morpheme or of some other syntactic device, as word order.'

A suitable point of departure for a discussion of the notion of grammatical meaning is the classic treatment by Edward Sapir (1921, Chapter V). Although the term 'grammatical meaning' itself is not used there, the topic, denoted in the chapter heading as 'grammatical concepts,' is the same. According to Sapir's initial taxonomy, concepts used in language are either 'concrete' or 'relational.' This coincides, more or less, with the lexical:grammatical distinction. The use of the terms 'concrete' and 'relational' is thus somewhat different from what is usual. Sapir actually never gives an explicit definition of the terms but comments on his example 'The farmer killed the duckling' as follows: "A rough and ready analysis discloses here the presence of three distinct and fundamental concepts" (p. 82) – these are expressed by the three lexical words *farmer*, *killed*, and *duckling* – "that are brought into connection with each other in a number of ways."

Apparently, then, the relational concepts, which are in this particular case, definiteness of reference, singularity, declarative modality, and 'subjectivity' and 'objectivity' (meaning the roles as subject and object), and which are expressed through grammatical morphemes or word order, are responsible for the connections between the concrete elements. However, it is really only the last two, which correspond

Grammatical Meaning

Ö Dahl, Stockholm University, Stockholm, Sweden

© 2006 Elsevier Ltd. All rights reserved.

Grammatical meaning is usually seen as opposed to lexical meaning. Grammatical meaning thus ought to include any aspect of linguistic meaning that is due to the grammatical structure of an expression rather than to the choice of lexical items. The variation in the definitions found in the literature suggest, however, that the notion is not wholly well understood. Consider, for illustration, the following sample formulations: 'the part of meaning that varies from one inflectional form to another'; 'the meaning of a word that depends on its role in a sentence'; 'the meaning of an inflectional morpheme or of some other syntactic device, as word order.'

A suitable point of departure for a discussion of the notion of grammatical meaning is the classic treatment by Edward Sapir (1921, Chapter V). Although the term 'grammatical meaning' itself is not used there, the topic, denoted in the chapter heading as 'grammatical concepts,' is the same. According to Sapir's initial taxonomy, concepts used in language are either 'concrete' or 'relational.' This coincides, more or less, with the lexical:grammatical distinction. The use of the terms 'concrete' and 'relational' is thus somewhat different from what is usual. Sapir actually never gives an explicit definition of the terms but comments on his example 'The farmer killed the duckling' as follows: "A rough and ready analysis discloses here the presence of three distinct and fundamental concepts" (p. 82) – these are expressed by the three lexical words *farmer*, *killed*, and *duckling* – "that are brought into connection with each other in a number of ways."

Apparently, then, the relational concepts, which are in this particular case, definiteness of reference, singularity, declarative modality, and 'subjectivity' and 'objectivity' (meaning the roles as subject and object), and which are expressed through grammatical morphemes or word order, are responsible for the connections between the concrete elements. However, it is really only the last two, which correspond

to the syntactic functions of the two nouns in the sentence, that are relational in the sense of specifying relations between the lexical elements. It is more difficult to understand why, for instance, singularity, 'expressed by lack of plural suffix *-s* . . . and by suffix *-s* in the following verb' has to be regarded as relational. Moreover, as Sapir notes, the cardinality of referents would not be systematically indicated in many languages, and can be expressed also by lexical means, e.g., by a numeral. The necessary conclusions are that not all relational (i.e., grammatical) concepts are equally essential in language. Sapir is thus led to postulate a category of 'concrete relational concepts,' which can vary from language to language, not only in their expression, but also as to their concreteness. Relational concepts such as subjectivity and objectivity on the other hand are not subject to this variation: "The fundamental syntactic relations must be unambiguously expressed" (p. 94). It does seem that Sapir gets a bit entangled in his own reasoning here. On the one hand, he no is longer able to use the distinction between concrete and relational as an explanation for what is grammatical and what is lexical in languages; rather, he takes the grammatical status of a concept as an indicator of its concreteness or relationality, thus opening himself to allegations of circularity. On the other hand, the unequivocally relational concepts, which have to be expressed in languages, no longer display themselves as clearly semantic: he himself speaks of 'fundamental syntactic relations.' Sapir's predicament does reflect the complexity of what Crystal (1997: 107) aptly calls "an area of study that falls uneasily between semantics and grammar."

Much of the uneasiness is related to the fact that distinguishing the contributions of grammar and lexicon to meaning is no less problematic than separating the roles of genes and environment in an individual. A neat division between grammatical and lexical meaning presupposes that linguistic expressions are like buildings where the building blocks (the lexical items) are independent of the cement (the grammar). But there is always a restricted number of ways in which a lexical item can be combined with others, and the meaning of the lexical item can often be expressed only in terms of what the resulting combination means. For instance, it is rather difficult to explain the meaning of a verb such as 'borrow' without placing it in a construction such as 'NP borrows NP from NP,' or to explain the meaning of 'father' without mentioning the persons involved in the 'x is the father of y' relation. In formal semantic frameworks such as Montague Grammar, the meanings of relational terms such as 'borrow' and 'father' are specified in terms of functions (in the mathematical sense of 'mapping') from the meanings of the argument expressions to the meaning of the whole. By abstracting away from the content of the specific lexical items, we may arrive at more general constructions, such as 'NP Verb NP Prep NP,' which, in formal semantic terms, have to be interpreted as second-order functions (that is, functions that take other functions as their arguments). It is at the level of constructions that the interface between grammar and meaning has to be sought, as has been argued by proponents of Construction Grammar, and the grammatical meaning of linguistic elements in general can only be understood in terms of their roles in larger constructions.

Grammatical markers and features such as word order and prosody undoubtedly serve the function of making it easier to grasp the structure of a complex expression, in particular the hierarchical relationships between elements. However, the choice of grammatical elements such as inflectional morphemes may also depend on factors that have little to do with the structure of a sentence and sometimes directly reflect extralinguistic features of the situation or of referents of the discourse. This makes it difficult to uphold a thesis that the meaning of inflectional markers (and of grammatical morphemes in general) is different in kind from that of lexical morphemes.

Rather, inflectional markers differ from lexical morphemes in the role their meanings play in the speech act. A past tense marker in a language such as English normally does not have the function of informing the listener that the event or state referred to took place in the past; rather, it is an obligatory feature (except in some specific styles or genres) of any verb that refers to a state-of-affairs in the past. A related property of inflectional markers is that it is typically difficult or impossible to focus on them or, what can be seen as a special case of focusing, to negate them separately.

Grammaticalization

I Wischer, University of Potsdam, Potsdam, Germany

© 2006 Elsevier Ltd. All rights reserved.

Grammaticalization (also 'grammaticization') is generally regarded as a process by which linguistic elements (lexical, pragmatic, and sometimes even phonetic items) change into constituents of grammar, or by which grammatical items become more grammatical in time. Examples are the development of auxiliaries from lexical verbs, or prepositions from nouns; the development of inflections from free adpositions; and the change of word-orders that signal pragmatic meanings, like theme or rheme, into grammatical word-orders that signal the syntactic cases of subject and object. Furthermore, it includes the functionalization/grammaticalization of phonological or prosodic features, such as palatalization and initial mutations to distinguish different cases; number and gender in Irish; or a particular tone taking over the function of a nominal classifier in Chinese. The whole concept of grammaticalization can be characterized as the diachronic process and the synchronic state of coding of grammatical categories, such as case, number, gender, tense, aspect, mood, etc. (for a general reference work cf. Hopper and Traugott, 2003).

It is widely assumed that linguistic items historically go through the following stages:

(1) free lexical unit > function word > affix > zero

The change from free lexical units to function words builds up periphrastic, or analytical, constructions. In a further step, synthetic structures can develop via cliticization, or affixation. Here simple agglutination

is taken to precede an inflectional stage of affixation, which may end up as morphonological material, such as ablaut in the Germanic languages marking past tense (*sing – sang*). Finally, affixes can erode and either turn into meaningless phonological material ('phonogenesis'), or they are dropped altogether. Both alternatives often result in a functional renewal. Within this cycle we can see two basic subtypes of grammaticalization operating on the propositional level of language:

1. the functionalization of lexemes
2. cliticization/affixation.

Two further subtypes of grammaticalization can be distinguished:

3. the syntacticization of pragmatic relations, affecting the syntax of a language, for example, if word-order assumes a grammatical function
4. pragmaticalization, operating on the discourse level, e.g., the development of discourse markers or modal particles.

As a theoretical framework of linguistic change, grammaticalization relies on the interdependence between langue and parole, and on the gradualness of change that allows intermediate stages. So it challenges the discreteness of linguistic categories, even that between grammar and the lexicon. While in generative grammar syntactic change is regarded as autonomous, grammaticalization theory includes pragmatic, semantic, and phonetic motivations.

Earlier Thoughts about Grammaticalization

The term 'grammaticalization' was supposedly first used by Antoine Meillet (1912). He applied it to denote the evolution of grammatical forms (function words, affixes, etc.) out of former lexical material. However, similar ideas about the origin of grammar have a very long tradition (cf. Heine *et al.*, 1991; and Lehmann, 1995 on the history of research in grammaticalization). For example, von Humboldt (1822) and von der Gabelentz (1901) proposed that the source of inflectional endings is to be found in the lexicon, whereby lexical words gradually lose their independent character, lexical meaning, and original sound structure before they turn into affixes. Whitney (1875) described the genesis of grammatical forms in a similar way, referring for instance to the past tense inflection in English *–ed* having developed from a free form meaning 'did,' or the French future inflection *-ai*, as in *donner-**ai*** '(I) will give' having derived from the present form of *avoir* 'have.'

Meillet (1912) saw grammaticalization as one important principle of grammatical change besides analogy. He not only applied it to the evolution of inflections and function words but also included the functionalization of word-order in his studies (for a rejection of this concept see Heine and Reh, 1984). Unfortunately, he also provided examples that are not instances of grammaticalization, but rather belong to the field of lexicalization (*hiu tagu* 'on this day' > *heute* 'today'). This is a case of univerbation, the result of which is not an element of grammar, but a new lexical unit (see section on Grammaticalization and Lexicalization below). Discussions about the relationship between lexicalization and grammaticalization have become very prominent recently (Moreno Cabrera, 1998; Lehmann, 2002).

In the first two decades of the 20th century it were especially the Indo-Europeanists who applied the concept of grammaticalization to the evolution of the inflectional categories of Indo-European languages. Such approaches had a strictly diachronic orientation. When structuralism came up, and later generativism, studies in grammaticalization declined. Diachronic processes were no longer the center of interest, and the concept of grammaticalization synchronically challenged their fundamental theoretical constructs, such as the discreteness of categories and the autonomy of syntax.

An enormous renewal of interest in grammaticalization studies began only in the 1970s in America, probably with Givón's paper entitled, 'Historical syntax and synchronic morphology: an archaeologist's field trip,' containing the famous slogan "today's morphology is yesterday's syntax" (Givón, 1971: 413). In Germany in the 1980s, works on grammaticalization within the Cologne Project for the Study of Language Universals promoted a revival in this concept of grammatical change. Attention was mainly drawn to manifestations of grammaticalization in a wide range of languages and their consequences with regard to typological aspects or language universals.

Mechanisms Involved in Grammaticalization

The motivating factors for a grammaticalization process lie in the speaker-listener interaction. At the speaker's side it is the maximization of economy that leads to signal simplicity (see 'Phonetic Attrition' below) and the maximization of clarity or expressivity, resulting in innovation. In French, for instance, the negative particle *ne* has been reduced for economical reasons. On the other hand, speakers added semantically appropriate independent nouns to reinforce the negative meaning or make it more expressive. In Old French we find words like *amende* 'almond,' *areste* 'fish-bone,' *gote* 'drop,' *mie* 'crumb,' *pas* 'step,' *point* 'dot,' and others.

In the course of time, one of them (*pas*) has become the new grammatical predicate negator.

Listeners, on the other hand, have to cope with the innovation- and reduction strategies. They will always search for the most obvious interpretation, applying a particular mode of reasoning, namely 'abduction.' They proceed from the observation of a new structure and, on the basis of this, invoke a law. In the case of the French negation, they interpreted *pas* as the negative marker. At the same time other speakers might still have seen it as an optional emphasizer.

Other decisive factors for the triggering and continuation of a grammaticalization process can be found in the source meaning of the grammaticalized item itself, and also in changes in other subsystems of the language system. The source structures must imply some features of the target meaning and their semantic structure must be simple enough so that they can become schematized. Usually they are frequently occurring basic level terms. Temporal or aspectual grams (or grammemes) mainly derive from movement verbs (*go, come*) or verbs of physical state (*sit, stand*). Prepositions or conjunctions often have their sources in body part items (*after, in front of*). Other frequent sources are natural phenomena (*earth, sky*), human items (*person, father*), mental process verbs (*know, think*), quantifiers, and demonstratives (cf. Heine *et al.*, 1991).

The whole process of grammaticalization combines a number of certain general principles and mechanisms of language change. They can be considered as universally involved in the evolution of grammatical forms, as has been attested by studies on a wide range of languages. Only in their interaction they result in the codification of grammar.

Specific Mechanisms

Pragmatic Inferencing The abduction process leads to syntactic reanalysis. This, however, is accompanied by semantic changes. The new meaning, which is going to be grammaticalized in further development, may arise as a conversational implicature. These implicatures are invoked in particular linguistic contexts due to innovations by the speaker. They are pragmatic phenomena (*see* **Pragmatics: Overview**) that are based on lexical meaning and arising from *speech act* maxims, such as the maxim of extravagance (cf. Haspelmath, 1999). Speakers use explicit formulations in an unusual way in order to catch the attention of the audience. By this unusual use linguistic items can become ambiguous and receive alternative interpretations in the given context. Through frequent use in such contexts, these conversational implicatures can become conventionalized and turn into semantic features of the linguistic item that is undergoing the change. The new meaning now comes to be an integral part of a polysemous word. Thus, grammaticalizing items usually undergo a semantic change that leads from ambiguity to polysemy. Such semantic change is not confined to grammaticalization. However, here it always goes in the same direction. The implicature is more abstract than the original meaning, which allows a wider range of contexts in which the item can be used.

Metaphor/Metonymy There are two types of pragmatic inferencing: metaphor and metonymy. In metaphorical processes a term denoting a more basic or concrete entity is used to signify a more abstract one. This semantic change can be described in terms of transfers across conceptional domains. (cf. Heine *et al.*, 1991). The new meaning is not present in the context of the former use, but the inference is based on similarity between the concepts. This is, for instance, the case when body part terms are used to denote an abstract local position.

With metonymy, the new meaning is present in the context. It is based on contiguity. In the sentence s*he is going to the window,* a movement in progress with a local direction is expressed. In *she is going to open the window,* the movement in progress is directed on an action. This context contains a posterior or future event understood as part of the situation. Through frequent use in similar contexts, this implicature was conventionalized in English, and the meaning of posteriority or futurity became an integral part of the construction *be going to*. Most grammaticalization processes involve metonymical inferences.

Semantic Bleaching The semantic change of the lexical item to be grammaticalized is one of generalization of meaning, or bleaching. Since grammatical units refer to very abstract concepts, such as temporal relations (past, future) or case relations (possession, goal), the items to denote these concepts must acquire a very general meaning (English *–ed* meaning 'past,' English *of* meaning 'belonging to'). Semantic bleaching occurs with all grammaticalization processes on the propositional level at the first stage, i.e., with the functionalization of lexemes, when for instance the English lexical verb *have,* meaning 'possess', changed into an auxiliary to denote anteriority. At the second stage, the affixation stage, a further semantic change usually does not occur.

Grammaticalization processes on the discourse level, which can also be called 'pragmaticalization,' involve a semantic change of subjectification. This can be found, for example, in the evolution of evidentiality markers or modal particles.

Morpho-Syntactic Reanalysis Each process of grammaticalization that includes a categorial change involves a morpho-syntactic reanalysis. The reanalysis modifies the underlying representations, as in:

(2)	*she*	[*is going*]	[*to the policeman*]			
	she	[*is going*]	[*to ask the policeman*]	> *she*	[*is going to*]	[*ask the policeman*]
	Subj	Verb	Complement	> Subj	Aux	Verb + Object

Analogy The syntactic reanalysis cannot directly be observed, but becomes apparent only through modified surface manifestations, which are the result of analogy, or rule generalization. Analogy itself does not affect rule change; it concerns the rule spread within the linguistic system and within the community. Once reanalysis has occurred, the new grammatical construction can spread to other linguistic contexts. In the case of *be going to,* it can now be followed by a verb phrase that is incompatible with the former movement meaning of *go*, as in *she is going to receive a letter.* It can even combine with on-agent subjects, as in *it is going to rain*.

Phonetic Attrition Phonetic attrition results from the maximization of economy by the speaker in oral conversation. It particularly affects linguistic items that have undergone grammaticalization. Due to their rather abstract meaning, they have a lower information value than lexical words, which is often reflected in a weaker phonological form. It has turned out that when a lexical form splits into two uses (see 'Divergence' below), the lexical unit retains its full phonetic form, whereas the functionalized item undergoes phonetic reduction, as in *one* vs. *a(n), is going to* vs. *gonna*. Phonetic attrition can finally contribute to the renewal of a grammaticalization cycle. This obviously happened with the Old Germanic predication negator *ne*, which eroded completely in the Germanic languages and was replaced by other negators like English *not* or German *nicht*.

General Principles (cf. Hopper, 1991)

Layering A newly grammaticalized item does not necessarily replace an older one in the same functional domain. Similarly, it is not necessary that an older form must die out to initiate renewal. Instead, new grammatical strata are continually emerging, and older layers may well co-exist with new layers within the same functional area. For example, the old way of marking the past tense by changing the stem vowels in English (*sing – sang*) exists side by side with the new mode of past formation by adding a dental suffix (*work – worked*).

Divergence When a lexical form undergoes grammaticalization, it typically develops an additional use of the item side by side with the original lexical form before it splits into two different items. Thus the English indefinite article *a* is the result of the grammaticalization of the Old English numeral *ān*. In Middle English it split into the numeral *one* and the new article *a*. This principle of divergence is often the reason why an incipient process of grammaticalization that did not go to completion is taken for a reversal.

Specialization At the initial stage of grammaticalization, a particular lexical item often stands in free variation with a whole range of other forms with slightly different semantic shades (cf. Lehmann's (1985) parameter of paradigmatic variability below), which can all serve a similar communicative function. As grammaticalization proceeds, the number of possible choices is gradually narrowed down and one specific item, which has become more general in meaning, is specialized for this particular function. With increasing specialization, the chosen item finally becomes obligatory: speakers are no longer free to choose it in a particular context, but the context forces speakers to use it. This happened, for example, with the French negator *pas*, which in Old French was still used among other competitive words, as mentioned above, to intensify the predicate negation.

Persistence After the process of grammaticalization has taken place, traces of the original lexical meaning or of the original grammatical constraints of the source unit persist in the new abstract grammatical meaning. They relate it to its former history as a lexical unit. So one of the meanings of the future marker *will* in Modern English is still that of willingness or intention, the source meaning of the lexical verb *willan* in Old English.

Decategorialization At the beginning of grammaticalization chains, an element of a major category with discourse autonomy (cf. Hopper and Thompson, 1984), especially a noun or a verb, often loses this categorial autonomy and is downshifted to a secondary category, such as a preposition, conjunction, or complementizer. It tends to lose the morphological and syntactic properties that would identify it as a full member of the former major category (from Hopper, 1991: 30):

(3) our thanks were accepted by the mayor – **thanks** to his generosity

For a critical approach to decategorialization see Lehmann (2002), who did not necessarily treat the

genesis of minor word classes as an instance of grammaticalization. He distinguished, for instance, between more lexical and more grammatical adpositions, arguing that complex prepositions and conjunctions do not indicate incomplete grammaticalization processes; they are simply products of lexical change.

Grammaticalization from a Synchronic Perspective

From a synchronic perspective, linguistic units are ordered along a continuum between relatively unconstrained lexical and more constrained grammatical structure. They exhibit a certain degree of grammaticalization. According to Lehmann (1985), this degree of grammaticalization can be determined in terms of six paradigmatic and syntagmatic parameters. Each of these parameters corresponds to a specific process in the diachronic dimension of grammaticalization:

(4) Paradigmatic Parameters:

(a) integrity	↔	phonetic/semantic attrition
(b) paradigmaticity	↔	paradigmaticization
(c) paradigmatic variability	↔	obligatorification

Syntagmatic Parameters:

(d) scope	↔	condensation
(e) bondedness	↔	coalescence
(f) syntagmatic variability	↔	fixation

Thus (a) high integrity (little semantic and phonological substance) is a sign of strong grammaticalization compared to phonological and semantic complexity, which hint at a lower degree of grammaticalization (compare the prepositions *of* versus *in front of*). If (b) the item belongs into a small, tightly integrated morphological paradigm, rather than participating loosely in a semantic field, this would be an instance of strong grammaticalization, like for example the articles *the* and *a*, which form a closed class in English. Such items usually expose (c) low paradigmatic variability. Their use is largely rule-governed. If they instead allow a free choice according to communicative needs, it is an indicator of weak grammaticalization, as in Old French, where we still find a number of variable items to negate a sentence (*pas*, *amende*, *areste*, *gote*, *mie*, *point*,...; cf. 'Specialization' above). The (d) criterion of scope is somewhat controversial. While prototypical cases of strong grammaticalization usually have a narrow structural scope (case markers, classifiers, tense/aspect/mood markers, etc.), there are other items with a wide scope, such as complementizers or discourse markers, which may govern a whole clause or even modify a whole proposition (Bybee, 1985). The parameter of (e) bondedness relates to the fact that bound morphemes (affixes) are stronger grammaticalized than free items. (f) low syntagmatic variability (if the item fills a fixed slot in the syntactic structure) is similarly an indicator of a high degree of grammaticalization.

Unidirectionality

Well-established in diachronic perspectives of grammaticalization, though hotly debated, is the assumption that the change from less grammatical to more grammatical forms is irreversible. So it is argued that grammaticalization clines, like (5), cannot be reversed:

(5) lexeme > function word > clitic > inflection > zero

That means that a grammatical item, whether free or bound, cannot gradually gain in semantic complexity, pragmatic significance, syntactic freedom, and phonetic substance.

The concept of unidirectionality is not only based on extensive empirical evidence, but also on a number of theoretical considerations:

1. The generalization of meaning allows the use of the grammaticalized item in more and more contexts (*go* meaning 'to move' can only combine with agent nouns and directional complements, but *be going to* with a future meaning can take all kinds of subjects and verb phrases). A reversal of generalization would restrict the number of contexts and gradually increase the constraint in the environments of a form, which is very unlikely for a linguistic item that has reached a certain degree of abstractness and general use;
2. Decategorialization, the shift from major categories to minor ones (N > Preposition/Conjunction, V > Auxiliary/Preposition) is much more frequent crosslinguistically than its opposite. Alleged counterexamples to decategorialization are simple instances of conversion (*the ups and downs*) or secretion (*an ism*). These are the result of rather conscious, spontaneous word formations, and not of gradual degrammaticalization processes. Degrammaticalization is virtually impossible, because speakers have only limited conscious access to functional elements. Thus it is very unlikely that they should use them in place of less grammaticalized ones (cf. Haspelmath, 1999).
3. If the semi-modals *dare* and *need* seem to develop in the direction of lexical verbs today, this is no evidence of a reversal of grammaticalization. It only shows that changes need not go all the way to completion. According to the principle of divergence, the former lexical verb and the new

auxiliary-like form can coexist for quite a long time. In such a situation, it is possible that the innovative use cannot get hold in the language community and is finally given up. What looks like a reversal is just an incomplete change.

Still, most scholars acknowledge that exceptions to the unidirectionality hypothesis exist. One well-known potential example is the English possessive *–'s* morpheme. It seems to have developed from an inflection in Old English to a clitic in Modern English. If this was indeed the case, it must have gained in syntactic freedom, and we have a clear counterexample to the grammaticalization cline. However, there remain doubts about what really happened after the decay of the inflectional case system in English. One possible explanation could be that in the functional renewal process, the former genitive inflection *–s* was reinterpreted as a possessive marker and, supported by pronominal possessive constructions like *the king his castle,* was exapted into the function of a possessive clitic (on exaptation see Lass, 1990).

Since almost nothing is exceptionless, there might of course be instances of language change that run counter to the general grammaticalization cline. However, such occurrences are extremely rare compared to the large number of cases that support the unidirectionality claim.

Grammaticalization and Lexicalization

While grammaticalization is concerned with the development of grams, lexicalization refers to emerging lexemes. Both processes in general are not at all contradictory or mirror images, and we cannot say – as some people believe – that lexicalization is the reversal of grammaticalization. On the contrary, both processes have much in common. They just operate on different levels of the language.

Grammaticalization and lexicalization both usually involve reductive processes, which lead to an increased phonetic integrity. Morpho-syntactic reanalysis can be part of both a grammaticalization- and a lexicalization process. Semantically, however, the processes differ in that grammaticalization reduces the semantic complexity, resulting in a more abstract meaning, while lexicalization adds semantic components to make the meaning more specific. For example, *blackbird* comes to denote a specific type of bird and not just any kind of black bird (in this case it need not even be black). With increasing demotivation, the new sign becomes conventionalized and can no longer be processed analytically.

It is even possible that grammaticalization and lexicalization occur together in a given case: the Early Modern English discourse particle *methinks* 'I think' had derived from a once productively formed, impersonal construction by fossilization, conventionalization and partly demotivation (since impersonal constructions had become unproductive by that time). It therefore had changed into a symbol, a formula, and as such it had to be stored as a whole entity in the lexicon. The newly developed 'lexeme,' however, is classified as an adverb. Syntactically it operates as a disjunct to mark evidentiality. As such a discourse marker, it belongs to a relatively closed class of linguistic elements. So the new sign has immediately taken over a grammatical function on the discourse level and is thus grammaticalized.

Grammaticalization and Language Contact

Grammaticalization processes appear to be extremely productive in language contact situations, where such developments proceed faster. It has been noticed that under contact conditions affixes are often dropped, and new periphrastic constructions emerge. This seems to be brought about by the particular communicative needs that require more transparent linguistic means. For example, the erosion of the genitive and dative case inflections in Late Old English and Middle English, when English was in close contact first with Old Norse and later with Norman French, was accompanied by the increasing grammaticalization of the prepositions *of* and *to*. Thus the initiation of a new grammaticalization chain can be caused by particular communicative requirements.

However, it is also possible that specific features in the grammar of the contact language may interfere with a 'normal' grammaticalization process. A parallel category in a contact language may accelerate the evolutionary process of an emerging construction in the native language. Furthermore, a contact language may influence the source material or the particular path of grammaticalization.

Pidgin and creole studies are exceptionally attractive fields of research in the origin and development of grammaticalization phenomena. While pidgins can be characterized as pregrammatical stages of a language, relying basically on lexical words with a high degree of context dependence, in creoles the emergence of a new grammar can directly be observed. It has turned out that the processes of organization and coding of grammatical categories in the various pidgins and creoles of the world show significant parallels.

Current Trends in Grammaticalization Studies

During the last two decades, the amount of research within the framework of grammaticalization has

increased enormously. Numerous books and articles have been published and conferences are held regularly on the topic. Several collective works (Pagliuca, 1994; Giacalone Ramat and Hopper, 1998), conference volumes (Traugott and Heine, 1991; Wischer and Diewald, 2002; Fischer *et al.*, 2004), and even a *World lexicon of grammaticalization* (Heine and Kuteva, 2002) have appeared.

Among the topics that attract particular attention today are theoretical and terminological questions concerning the relationship between grammaticalization, lexicalization, and the problem of unidirectionality; the role of contexts in the process of grammaticalization; and the study and description of the paths of grammaticalization of individual linguistic items in various languages of the world. Many empirical works are based on large text corpora of spoken or written language (cf. Bybee *et al.*, 1994; Rissanen *et al.*, 1997).

While earlier studies focused to a great extent on central or traditional grammatical categories, such as tense, aspect, or case, much of the current work is done in formerly more or less neglected areas of grammar, for instance, discourse markers, honorifics, or classifiers. A further new tendency that has emerged is the aim of confronting and integrating grammaticalization theory with other theoretical works in descriptive and historical linguistics, such as philosophically and philologically oriented frameworks of language change, cognitive approaches, or even generative grammar (cf. Roberts and Roussou, 2003).

Although grammaticalization theory attracted occasional criticism, mainly from generative or traditional scholars (Newmeyer, 1998; Campbell, 2001; Joseph, 2001) who regard it as an epiphenomenal result of independent processes, the data which have been examined constitute convincing evidence that the mechanisms and principles involved in grammaticalization conform to a complex process of coding and organization of language, which is universally applicable to describe the evolution of grammatical forms.

Grammatology

P A Brandt, University of Aarhus, Aarhus, Denmark

© 2006 Elsevier Ltd. All rights reserved.

Grammatology comes from Greek *gramma,* 'written sign,' pl. 'writing, book, text,' a neologism from I. J. Gelb (1952), who studied writing systems as such. It is used by the late French philosopher Jacques Derrida (1967a) in a work that gave rise to a special form of philosophy of language influenced by Heidegger's critique of metaphysics, Saussure's semiology, Lacan's psychoanalysis, and French structuralism (*see* **Heidegger, Martin (1889–1976); Saussure, Ferdinand (-Mongin) de (1857–1913); Lacan, Jacques (1901–1981); Structuralism; Discourse, Foucauldian Approach**). The term is sometimes used to designate further developments of Derrida's critical philosophy, and is then almost synonymous with 'deconstruction' (*see* **Poststructuralism and Deconstruction**).

Grammatology is thus a philosophical and historical reflection on the general features and effects of the semiotic phenomenon called writing (*see* **Writing and Cognition; Semiosis**).

Writing and the Voice

Literally designating the study of writing and writing systems, the term *grammatology* is taken here in the specific sense introduced by Jacques Derrida. In his critique of what he calls "Western Metaphysics" – which is for him an overall format of thinking based on the reference to Presence and Consciousness – a phenomenological distinction is made between writing and speech; the latter (as opposed to the former) is seen as the source of a significant experience of agency, an experience that lets the speaker feel and believe that the meaning of his utterance is as present to him as the sound of his own voice. In his reading of Husserl (especially the first of the *Logische Untersuchungen,* 1900–1901), Derrida (1967b) thus assumes that this experience of orally accessible 'presence' of meaning is constitutive in phenomenology altogether as a philosophy of Consciousness, as evidence of the 'presence' of consciousness to itself, and as a tie linking the voice and the phenomenon (*see* **Husserl, Edmund (1859–1938)**). The phenomenon in general is as 'near' and 'immediate' to the conscious subject as is the meaning of a spoken word or utterance, because the auto-acoustic experience of the speaker's own voice makes the expression of this meaning appear 'close' to him, so that the subject can know it as an 'immediately' appearing phenomenon.

The concept of consciousness as intention and intentionality is thus for Derrida a construction linking the phenomenon and its intentional (intended) meaning on the grounds of the voice. Western culture has privileged this experience by its phonetic writing, Derrida thinks. Written culture therefore has conserved the oral illusion of self-consciousness and made it a dominant feature of its philosophical idealism, its all-pervasive ideology or metaphysics: logocentrism. Nevertheless, writing remains different from speech; written language is never exactly identical to spoken language, even if it simulates it. Written texts have meanings that are different from those we find when we believe in this simulation, that is, when our reading follows the instructions of the simulated voice of someone who apparently wants to speak to us. But if the exteriorization performed in manifested speech is comparable to and inseparable from that of written language – if it is true, in a certain sense, that we always 'write,' even when we speak – then speech also turns out to be a sort of writing and therefore should distort the idea of the interiority of experienced meaning as much as literal writing does. Because of the exteriority of the written linguistic expression, we can never really phenomenologically 'experience' and 'know' what we are saying (indeed: writing), even if we do feel that we know what we want to say. Therefore, conscious intuitions about the meaning of 'online' expression cannot be trusted.

This grammatological argument of writing is used in order to 'deconstruct' metaphysics as a philosophy

of consciousness. Thinkers who have felt the threat of writing have discussed the graphic problem in terms of a subversive corruption of the pure and present oral expression by the impure and morally dangerous writing, and have thus opposed the vivifying 'living word' to 'dead letters,' or the true voice to the false written signs; or even the good voice as opposed to the evil writing. The uneasiness about writing and the writ can be found throughout theological, pedagogical, epistemological, and linguistic discourse. It has inversely, through a critical and 'deconstructive' interpretation of this kind, inspired a 'subversive' style of thought and a general negative and skeptical attitude to any values, principles, and possibly positive contents of consciousness that might be found in human discourse.

In Jacques Lacan's version of Freudian psychoanalysis, the deconstructive attitude is matched by a radical rejection of ego-psychology and other theories based on a self as representative of a stable, conscious 'I' (*see* **Psychoanalysis and Language**). In literary criticism, this militant antiphenomenological way of thinking has given rise to a deconstructionist style of reading, a trend in interpretation that considers the quality of literature to depend on its importance as a subversive antimetaphysical activity (Bloom *et al.*, 1988). It may be recalled that Roland Barthes already had distinguished 'style' and 'writing' along similar lines: 'style' is reactionary; 'writing' is militant and revolutionary (Barthes, 1953) (*see* **Pragmatics of Reading; Barthes, Roland (1915–1980)**).

However, the problem of understanding the difference between speaking and writing (in French, *l'écriture*) is not only a literary and philosophical issue concerning subjectivity and the first person; it is also important to linguistics and semiotics in that it concerns the very concepts of sign, signifier, enunciation, and language.

Writing and the Sign

Whereas most linguists maintain the Aristotelian view (*De interpretatione*: 1) that the written sign is a signifier of the signifier, and written words are the symbols of the words pronounced by the voice, the Danish linguist Louis Hjelmslev (1943) claimed that the distinction between form and substance on the level of expression should neutralize the difference of substances (here, voice versus writing), since only the immaterial form is or should be relevant to linguistic analysis (*see* **Copenhagen School**). Nevertheless, Hjelmslev continued to think of phonology as the proper formal representation of linguistic expression. Ferdinand de Saussure had vigorously followed Aristotle, but as Derrida (1967a) remarks, he not only on the one hand criticizes the phonetic deformations of words by the 'perverse' effect of writing, but on the other also describes the phonetic system of differences, which is essential to his concept of language as a sign system, as being analogous to a system of letters: writing is thus both alien to authentic language and a good model for it!

Derrida concludes that this ambiguity follows from Saussure's grounding belief in the sign as a basic unit, a belief Derrida characterizes as due to a 'theology' of the sign inherent in Western metaphysics (*see* **Sign Theories; Saussure, Ferdinand (-Mongin) de (1857–1913)**). In this 'semio-theology,' there is an interior meaning and a nearly interior (vocal, oral) expression of that meaning, and then an entirely exterior (written) expression of that first expression – and this secondary expression is a deformation of the primary one, a sort of sinful, fallen version of a signifier that originally was pure. Still, even in this view, phonology is 'like' writing, so the fallen seems inscribed in the pure in some strange way (also called 'arch-writing'). Of course, the 'purest pure' would be the entirely interior meaning existing before any sign let it 'fall' out into the world. This is essentially what Derrida sees in semiology: a belief that meaning is some spiritual substance that 'falls' into the world through the sign. He refers to this reading of semiology as a deconstruction of it. The very term *deconstruction* implies that the 'subversive' and ridiculing analysis of a concept or a doctrine will not be followed by any presentation of a constructive alternative. Instead, it invites a noncommitted skepticism.

The critique of the sign inspired by Derridean grammatology (Kristeva, 1969; Barthes, 1978; and others; see also Eco, 1984) generally accuses linguistic semiology based on Saussure (1962) of postulating a rigid, systemic foundation of meaning. A sign that contrasts another sign will have stable differences of meaning, anchored in stable differences of expression. Instead, the consideration of writing introduces, it is assumed, a dynamic, processual, and plastic view of language as a continuous production of meaning, fueled by the materiality of the signifier and by its unstable and ever-changing relation to other signifiers: its 'differance' (process of differing) as opposed to the static notion of 'difference' during the textual unfolding of symbolization. The model is often Freudian psychoanalysis, in which meaning is seen as emerging independently of the sign function and instead driven by the dynamics of an unconscious desire. Eco, who rejects differance in this sense, recognizes the need for a dynamic view of meaning and suggests that the sign has a built-in interpretative dimension, including inference, and that the use of entrenched codes in stable sign systems makes the

process of interpretation invisible but not absent (*see* **Eco, Umberto (b. 1932)**). The process is possibly but not necessarily stable, and never static. This is perhaps a rationalist's reply to an overtly anti-rationalist critique, but it leaves a question unanswered: How can there be two foundations of meaning, one – the sign function – assuming a code and another – writing – assuming its absence? The grammatological supplement would ask: how is it that 'code' happens to be a reference to writing (a book, codex)?

There may be other ways to set up a semiotics of writing. Here is one (cf. Harris, 1995): Since, for example, musical scores and mathematical formulae are equally 'written,' we might say that to write is in general to produce a list of mental instructions. These do not have to refer to language at all. But they can, and often do. Phonetic writing instructs the reader what to 'say' in order to present 'what the text says.' Correspondingly, musical writing lets us play what a 'text,' the score, instructs us to play, instead of playing our own music. Writing eliminates the performer's own 'voice' or enunciation and replaces it by some other instance's 'voice,' be this instance a person, an institution, or even a supernatural being. Hence the possible religious meaning of writing: the religions of the book let their sacred texts 'speak' to the believers from eternity.

In this perspective, literary writing exploits the grammatological possibility of expressing possible or just imaginable thoughts, feelings, and meaning patterns in general, without sealing the (textual) utterance by an author's biographical signature and personal identity. In this sense, it offers human minds the possibility of being 'others to themselves' in what they write, and to construct or reinvent their subjectivity rather freely. This is an important resource for all sorts of discourse where imaginative unfoldings are welcome. Therefore, it seems natural for literary writers and scholars to emphasize the 'subversive' aspect of writing (*see* **Narrativity and Voice; Literary Pragmatics**).

Writing and Subjectivity

Since literary texts imply a voicing that departs from the biographical subjectivity of a 'speaker' and thus allow a constructed, artificial enunciation, the meaning of such texts is not anchored in the given subjective conjunctures of their situation of production. This meaning therefore depends mainly on more general cultural contexts and their relevance to the linguistically given and its internal semantic structure. They have no definite pragmatics: there is no intending subject outside the text and no situation in which an utterer could intend anything, so all that remains is the structure of the written instructions for building up a meaning, a semantic whole, framed by the texts themselves. This is the challenge that gives rise to a structural semantics (Greimas, 1966) (*see* **Semantics–Pragmatics Boundary**). Texts are seen as containing abstract roles of sender and receiver (*destinateur, destinataire*), besides the narrative or otherwise structured discursive content. Such 'ghost speakers' in texts can carry simulacrums of feelings, beliefs, and attitudes of all kinds that contribute in essential ways to the final meaning of their literal purport (as in irony) (*see* **Irony**). In this sense, human phenomenology of emotions and so forth can be studied through systematic simulations, and psychology can be enriched by contributions from this 'experimental introspection' that literary works offer real readers for consideration or identification.

Anthropologically speaking, the absence of a personalized speaker often assigns authority to the written volume, be it a body of law, of knowledge, or of myths. The speaker is then an abstract, supernatural 'voice.' The textual volumes (rolls, books) are then often interpreted as 'bodies' and treated as precious immaterial beings, incorporated in costly material shapes that call for sacralization and worship, like relics. The precious volume of the writ is easily taken for a divine or diabolic or other supernatural fetish (cf. Borges, 1975). Even in modern Western cultures, oaths are taken on the material volume of sacred books, holy writs; even in profane political cultures embodying the volume of the nation's constitution is a revered book. The Book in general is felt as a transcendent body, a *corpus gloriosum*. Negatively, this phenomenon appears in the fears that provocative books produce and in books' subsequent treatment: They are still being burned in public, according to the principles introduced by the Inquisition, in the same spectacular way in which heretics were burned.

The powerful impact of language embodied in the written volume is manifest in literature, in science, and in religion. Grammars and dictionaries are less powerful in this emphatic sense, but still authoritative. The normative regulation of a language seems importantly dependent on such authoritative books and their inherent impersonal force of the speech acts involved (*see* **Speech Acts**). When new words or expressions are 'officially' adopted by a national language after having been used by reputable authors, they are inserted, accompanied by appropriate quotations, in these normative volumes, and this event sanctions them as worthy of being copied. Oral language use can differ drastically from the written norm without giving rise to any such change in respected norms, whereas literary writing, as quoted

in these normative books, is often the main source and argument for making terms or constructions accepted. This is well illustrated in French linguistic culture (*le bon usage*). In the Arab world, normative language control is an explicitly and directly religious phenomenon.

Writing and Technology

The Chinese wrote on paper in the 1st century B.C., and this new product replaced silk and bamboo in Turkestan in the 3rd century A.D. The Arabs learnt to use paper for writing in Samarkand and brought it to Spain in the 9th century; in the 12th century it was known in Italy; in the 13th in Germany; and in the 14th in England (Etiemble, 1985; Carter, 1955). Paper production in Europe developed a little later. During the Tang Dynasty (618–907), printing was practiced in China for magical and pedagogical purposes; the printer Wang Jie is known by his signature on a book from 868. In the 9th century, Feng Dao printed a first classical edition of Confucius (on wood). The Mongols carried the technique to Christian Europe at the time of their invasions. But the Koreans used iron plates around 1400. Gutenberg's (1400–1468) merit is to have understood the importance of this technique: He perfected ink and paper quality and made it possible to print on both sides with metal types. His first work was, of course, a Bible.

The Canadian Marshall McLuhan (1911–1980) declared in 1962 that the civilization of the book was anachronistic, and that the new electronic media would soon found a new type of world civilization, a 'global village' based on ultrafast transmission of information. The American G. L. Ulmer (1985, 1989), commenting on McLuhan, quotes Derrida: "this death of the book undoubtedly announces nothing but a death of speech and a new mutation in the history of writing, in history as writing . . . a new situation for speech, of its subordination within a structure of which it will no longer be the archon" (1967a: 18). Ulmer refers to Heidegger's critique of technology and recalls Derrida's term 'closure': there is no end of the book, but a closed era of linear writing, technologically submitted to speech. Beyond that closure, writing now displays a nonlinear force in aesthetics, and in particular in the visual arts as developed in the age of video and telecommunicated visuality, a force that he believes will trigger an ontological revolution against oral Presence (*see* **Cognitive Technology**).

In the contemporary world, computer technology is the predominant determinator of 'written' communication. It probably induces deep changes in human relations at all levels. The interface between man and machine has made the classical monological writing scene into a written dialogue between users, so, grammatologically speaking, instead of deconstructing Presence, this new screen-to-screen (instead of face-to-face) communication appears to expand the realm of intersubjective Presence.

The codes in which computer programs are written are metaphorically called 'language,' so human idioms are now often considered to be instances of 'natural language,' as if they were special variants of this basic operative writing, and not the other way round. The prestige of computer technology is so high that programming is about to become a crucial social activity – and its agents about to become the new, powerful 'masters of writing.' Correspondingly, forms of computational terrorism, of truly lethal violence obtained by writing programs multiplying destructive 'viruses' that destroy information, have developed (*see* **Adaptability in Human-Computer Interaction**).

Postscript

Writing is the most important semiotic factor in human civilization and its cultures. It conveys language across distances in space and time, and it defeats death in the elementary sense of allowing us to know our ancestors' thoughts and feelings in detail. Therefore, writing attracts philosophers' attention as much as it appeals to text-oriented linguists. From the grammatological speculations, prophecies, and debates, all intellectuals may learn that writing in general in fact constitutes a culturally necessary supplement to language, the manifestation of a symbolic dimension in human life that stays as difficult to understand, and even to tolerate, as ever, but also is as fundamental as ever in the human world of meaning.

"It is a striking paradox that the Western academic tradition, which has relied so extensively on writing – as opposed to oral transmission – for its very existence, has so far produced no comprehensive theory of writing itself." These are the opening words of the British linguist Roy Harris, whose book on the subject (1995) is, after Gelb, the first theoretically explicit and semiotically informed account of the semiology of writing. Harris shares Derrida's critique of 'logocentrism' as a pervasive European depreciation of all aspects of writing that cannot be treated as direct reflection of the spoken word; but then, instead of 'deconstructing' it, Harris suggests an empirically open-ended analysis of the culturally known processes of writing, whether related or unrelated to language, and offers a new and fresh start for the discipline of grammatology.

Graph Theory

A Sanfilippo, Pacific Northwest National Laboratory, Richland, WA, USA

© 2006 Elsevier Ltd. All rights reserved.

A graph is a structure consisting of a set {v1, . . . ,vn} of objects and a set {e1, . . . ,en} of relationships between these objects. Objects are generally referred to as vertices or nodes; relationships as arcs or edges. Graphs are most commonly represented as diagrams in which vertices are depicted as points and edges as lines joining vertices, as shown in **Figure 1**.

A graph can be used to represent any situation that involves discrete objects and relationships defined among these. The type of graphs that have proved most useful in modeling natural language are hypergraphs that are rooted, connected, directed, and acyclic. Graphs that are rooted, connected, directed, and acyclic have a single root vertex from which every other vertex can be reached, and contain directed edges with no cycles. Hypergraphs are graphs whose edges connect more than two vertices, e.g., e3 in **Figure 1.** Graphs that have these properties are particularly effective in accommodating the hierarchical and reentrant (structure sharing) character of natural language constructs. For example, the structure of a sentence can be effectively described by a graph such as the one in **Figure 2,** where:

Figure 1 Example of graph.

- Vertices represent syntactic features and categories;
- Directed edges indicate functions defined over these features and categories;
- The convergence of the agreement edge from the noun [and verb] phrases into the agreement features vertex indicates that the verb and noun phrases must share the same values for person and number.

Graph theory underlies the theory of feature structures that has emerged as one of the most widely used frameworks for the representation of grammar formalisms, from the late 1970s onward. Some of the linguistic formalisms based on feature structure theory include functional unification grammar (Kay 1979, 1985), parse and translate II (Shieber *et al.*, 1983; Shieber 1984), lexical functional grammar (Kaplan and Bresnan 1982), unification categorial grammar (Zeevat *et al.,* 1987) and head-driven phrase structure grammar (Pollard and Sag, 1987, 1994).

Feature structures can be seen as a kind of labeled finite-state automata (Kasper and Rounds 1986, 1990) that specify graphs such as the one shown in Figure 2 For ease of representation, feature structures are usually depicted using an attribute-value matrix notation, where each bracketed grouping corresponds to a vertex in the graph-based description, each feature corresponds to an edge, and structure sharing is indicated with a repeated bracketed integer, as shown in Figure 3.

The main operations defined over feature graphs are subsumption and unification – for a comprehensive introduction to the theory of feature structures, see Carpenter (1992). Subsumption makes it possible to arrange feature structures into an inheritance hierarchy so that information that is common across linguistic objects need not be repeated. For example, properties that are common to all verbs (e.g., features such as tense and modality, and the presence of a subject) are specified once for a generic verb template and then inherited by specific verb templates (Flickinger, 1987; Sanfilippo, 1993).

Unification provides the means for integrating two feature structures into one feature structure. The unification of two feature structures is generally defined as a monotonic operation; the resulting feature structure contains all and only the information in the two feature structures. Such a definition of unification ensures that feature structures that have contrasting values do not unify, e.g., the agreement features of a singular verb phrase would not unify with the agreement features of a plural noun phrase.

However, a relaxation of monotonicity in graph unification may, in some cases, be useful. For example, most English verbs display strong similarities in their inflectional paradigm. It would therefore be useful to define a generic verb template from which all verbs inherit the same inflectional paradigm by default, and then let irregular verbs override inherited information which is incompatible. While appealing, default inheritance can be problematic if not used in a controlled manner. For example, it is well known that multiple inheritance can lead to situations difficult to resolve when conflicting information is inherited from parent nodes (Touretzsky *et al.,* 1987). Although a number of proposals have been developed to solve or obviate these problems (Gazdar, 1987; Carpenter, 1993; Copestake, 1993; Lascarides and Copestake, 1999), a general solution is still not available.

Two areas related to computational and mathematical linguistics where graph theory has had a strong impact include knowledge representation

Figure 2 Graph representation of a simple English sentence such as *Hilary arrived.*

$$\begin{bmatrix} \text{sentence} & \\ \text{SUBJECT :} & \begin{bmatrix} \text{noun phrase} & \\ \text{AGREEMENT : [1]} & \begin{bmatrix} \text{agreement features} \\ \text{PERSON : 3rd person} \\ \text{NUMBER : singular} \end{bmatrix} \end{bmatrix} \\ \text{PREDICATE :} & \begin{bmatrix} \text{verb phrase} \\ \text{AGREEMENT : [1]} \end{bmatrix} \end{bmatrix}$$

Figure 3 Feature structure representation of the graph in Figure 2.

in artificial intelligence (Sowa, 1999; Brachman and Levesque, 2004) and social network analysis (Wasserman *et al.*, 1994; Scott, 2000). For a comprehensive introduction to graph theory and its applications see Gross and Yellen (2004).

Grassmann, Hermann Günther (1809–1877)

R Schmitt, Laboe, Germany

© 2006 Elsevier Ltd. All rights reserved.

Hermann Grassmann, born on April 15, 1809, in Stettin, was a remarkable scholar because he distinguished himself as a brilliant mathematician, a linguist, and a Vedic scholar. He did theological and philological studies at the University of Berlin and taught himself mathematics as an autodidact. After passing the teacher's examination in those subjects, he taught at various grammar schools, from 1852 as his father's successor at the Marienstift in his hometown, Stettin, where he died on September 26, 1877. Apart from numerous philological and mathematical schoolbooks and other practical textbooks, he published studies on the theory of algebraic curves and on optics and color theory, discovered laws of tonal colors, and laid the foundations of vector analysis.

Disappointed by the lack of appreciation for his mathematical publications, beginning in 1849 he turned more and more to Indo-European and Indological studies. First, he familiarized himself with Sanskrit and particularly with its more archaic variant, the language of the Vedas. Immediately after the complete text of the Rigveda had been edited for the first time in 1861–1863, Grassmann set about compiling a dictionary for this most ancient Indo-Aryan text, even if at first only for his own use. He published his *Wörterbuch zum Rig-Veda* in 1872–1875 and thus created a valuable tool for generations of Vedic scholars. In order to expand it with regard to the interpretation of the text, he followed it up with a two-volume translation of the Rigvedic hymns in 1877.

The name Grassmann lives on in linguistics to this day with 'Grassmann's Law' (see Collinge, 1985: 47–61). As presented in a long article of 1863, this law concerns the deaspiration of the first of two aspirates in the sequence of two aspirates, either as initial and final root-consonants or as the initials of two successive syllables.

Greece: Language Situation

A Georgakopoulou, King's College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

A well-known saying in Greek goes as follows: *η γλώσσα κόκαλα δεν έχει και κόκαλα τσακίζει - i γlosa kokala δen eçi ce kokala tsacizi* ('language does not have any bones and can break bones'). Interestingly, the word for language and tongue are the same, so in this case the reference to the spoken word is clear. The saying aptly reflects a widely held belief in Greece about the constitutive ('it can make things happen') and transformative power of language. Widely held views about the role of language in a community, often labeled as folklinguistics, are a valid and useful point of entry into local theories about communication. Another folklinguistic view in Greece involves the close link between language and culture which could be crudely summed up as follows: 'To be Greek you have to speak Greek.' This usually goes hand in hand with sentiments of pride for the language's continuity, which is by no means a fictional construction. Greek has undoubtedly got an

Hermann Grassmann, born on April 15, 1809, in Stettin, was a remarkable scholar because he distinguished himself as a brilliant mathematician, a linguist, and a Vedic scholar. He did theological and philological studies at the University of Berlin and taught himself mathematics as an autodidact. After passing the teacher's examination in those subjects, he taught at various grammar schools, from 1852 as his father's successor at the Marienstift in his hometown, Stettin, where he died on September 26, 1877. Apart from numerous philological and mathematical schoolbooks and other practical textbooks, he published studies on the theory of algebraic curves and on optics and color theory, discovered laws of tonal colors, and laid the foundations of vector analysis.

Disappointed by the lack of appreciation for his mathematical publications, beginning in 1849 he turned more and more to Indo-European and Indological studies. First, he familiarized himself with Sanskrit and particularly with its more archaic variant, the language of the Vedas. Immediately after the complete text of the Rigveda had been edited for the first time in 1861–1863, Grassmann set about compiling a dictionary for this most ancient Indo-Aryan text, even if at first only for his own use. He published his *Wörterbuch zum Rig-Veda* in 1872–1875 and thus created a valuable tool for generations of Vedic scholars. In order to expand it with regard to the interpretation of the text, he followed it up with a two-volume translation of the Rigvedic hymns in 1877.

The name Grassmann lives on in linguistics to this day with 'Grassmann's Law' (see Collinge, 1985: 47–61). As presented in a long article of 1863, this law concerns the deaspiration of the first of two aspirates in the sequence of two aspirates, either as initial and final root-consonants or as the initials of two successive syllables.

Greece: Language Situation

A Georgakopoulou, King's College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

A well-known saying in Greek goes as follows: *η γλώσσα κόκαλα δεν έχει και κόκαλα τσακίζει - i γlosa kokala δen eçi ce kokala tsacizi* ('language does not have any bones and can break bones'). Interestingly, the word for language and tongue are the same, so in this case the reference to the spoken word is clear. The saying aptly reflects a widely held belief in Greece about the constitutive ('it can make things happen') and transformative power of language. Widely held views about the role of language in a community, often labeled as folklinguistics, are a valid and useful point of entry into local theories about communication. Another folklinguistic view in Greece involves the close link between language and culture which could be crudely summed up as follows: 'To be Greek you have to speak Greek.' This usually goes hand in hand with sentiments of pride for the language's continuity, which is by no means a fictional construction. Greek has undoubtedly got an

impressively long history that spans about 3000 years. However, a blind adherence to this idea of continuity, often found in academic writings too, has at times obscured complex questions of language, ethnicity, and culture in favor of a simplistic narrative of Modern Greeks being the direct descendants of the Ancient Greeks and of a straightforward link between language and identity (cf. Tziovas, 2001). Though not unique to Greece as a modern nation-state, this link between language and a sense of collective belonging is exceptionally close in its case.

A terminological clarification is now in order: Amongst classicists, particularly in the Anglophone context, Greek tends to be reserved for Ancient Greek (Greek, Ancient) and is juxtaposed to Modern Greek. Outside academic circles, however, unqualified 'Greek' has earned its place in modern languages. At least 10 million people speak Greek as their first language in mainland Greece, and about 620 000 speak Cypriot Greek in Cyprus. There is also an increasingly large number of Greek speakers outside Greece, in various established diasporic communities, e.g., in the United States, Australia, Germany, but also in emerging professional and student communities, particularly in the Western world. Numerous studies have reported a high degree of Greek language maintenance for such communities, impressively so, particularly in comparison to the rapid language shift experienced by other linguistic minorities (see papers in Georgakopoulou and Spanaki, 2001). The active community support network, the role of the church, the close link between language and cultural identity, as presented above, and a romantic positive orientation to the homeland have all been implicated in this vitality of Greek. As a majority language in Greece, Greek is spoken alongside a number of established linguistic minorities (e.g., Arvanitika (Albanian, Arvanitika), a dialect of Albanian) which are undergoing a process of language loss and death (see papers in Alatis *et al.,* 1997), with the exception of the Turkish-speaking minority (in Thrace, Northern Greece) that is protected by the Treaty of Lausanne (1923). There are, however, several recent minorities (since the early 1990s) as a result of large-scale immigration, particularly from neighboring countries, e.g., Albania.

As a result of its long history, Greek exhibits an impressive coexistence of oral and literate traditions, including a cherished literary heritage, with two Nobelist poets in the 20th century. Even if numerous traditional genres are a dying breed (e.g., lament songs), the wealth of the language's oral tradition can nowadays be attested to in ordinary conversational exchanges, which are typified by an animated style of delivery that places emphasis on participation and empathy. This has been labeled by analysts as high-involvement style (Tannen, 1989). The frequency of storytelling and the value placed on a good (in the sense of well-performed) story as a display of the teller's communicative skill have also been noted (Georgakopoulou, 1997). Studies have also revealed ways of telling that were salient too in traditional genres, for instance, the importance of number three as an organizing principle in everyday stories, also found in folk songs.

Part of this impressive coexistence of the oral with the literate goes back to the language's long history of diglossia (dating as early as the Hellenistic period). In the emergence of Greece as a modern state in the early 19th century, diglossia involved the use of two varieties, a formal, purist variety (*katharevousa*) reserved for official and written purposes and an informal, low variety (*demotic*) reserved for spoken and informal occasions. This became a highly politicized and ideologically charged battle between two camps: katharevousa became the code of the conservatives, while demotic found ardent support from the left wing. The divisions started healing in 1976, when diglossia was officially abolished. In the aftermath of this abolition, what is currently known as Standard Modern Greek is based on demotic but presents numerous influences from katharevousa too (for details see papers in Alatis *et al.,* 1997; also in Georgakopoulou and Spanaki, 2001). Diglossia has bequeathed a certain metalinguistic awareness, at least to the speakers who are old enough to have been schooled in katharevousa. It is thus not uncommon for certain elements that stand out as katharevousa to be used for humorous and other stylistic purposes in various settings, e.g., the press.

In the modern world, Greek remains a lesser spoken and taught language. However, far from being marginalized or dispensable, even in contexts of acute globalization, such as computer-mediated communication and the Internet, the language is enjoying visibility and presence in a wide range of uses (see papers in Georgakopoulou and Spanaki, 2001) from email messages, which young Greeks are particularly keen on, to text-messaging, e-chats, and numerous cultural and academic websites.

Greek Lexicography, Classical

E Stathi, Berlin-Brandenburgische Akademie der Wissenschaften, Berlin, Germany

© 2006 Elsevier Ltd. All rights reserved.

Ancient Lexicography

Greek lexicography originated in the 5th century B.C. in the compilation of glossaries and in explanations of difficult words in the works of Homer and other authors. This glossographic activity flourished during the 4th and 3rd centuries B.C. in the philological school of Alexandria. The first attempt to compile a dictionary based on this tradition was made by Aristophanes of Byzantium in his work *Λέξεις* (*Lexeis*). In the 1st century A.D., the Alexandrian grammarian Pamphilos compiled a glossary, *Λεξικόν* (*Lexicon*), consisting of 95 books. Shorter versions of this work (epitomes) were produced by the grammarians Diogenianos (2nd century) and Hesychius of Alexandria (5th century) (edited by K. Latte, 1861). During the Byzantine era, Photios, Patriarch of Constantinople (9th century), compiled glossaries and etymological dictionaries. *Suda* (or *Suidas*) (10th century) is a combined glossary and encyclopedia (edited by A. Adler, 1928).

In Hellenistic times, after the conquests of Alexander the Great (4th century B.C.) the various Greek dialects were replaced by a common form of Greek (Koiné), which developed from the Attic dialect. In the 2nd century A.D. the Atticist movement, a reaction against the Koiné, required that good style entailed writing in the pure Attic dialect of the 5th and 4th centuries B.C., the language of the classical authors. In this tradition, puristic dictionaries were created for the first time, including words found in classical authors and neglecting words from the Koiné, the contemporary language. Such is the dictionary of Phrynichos. An exception is a synonymic dictionary, *Onomasticon*, by Ioulios Polydeukes (Pollux) (edited by E. Bethe, 1900).

Modern Lexicography

The Renaissance milestone for Greek lexicography is the *Thesaurus Graecae Linguae* (Paris, 1572) of Henri Estienne (or Henricus Stephanus). This vast dictionary gives Latin equivalents for Greek words, covering most classical Greek authors and providing citations that illustrate the context of the different senses and etymologies. The words are arranged not in strict alphabetical order, but grouped into derivational word families. Many dictionaries of the 17th and 18th centuries were based on Estienne's work, using modern vernaculars as the metalanguage.

The most important of these is Johann Gottlob Schneider's *Kritisches Griechisch-Deutsches Handwörterbuch* (1797–1798). Franz Passow developed this work in several stages; its final form, the *Handwörterbuch der griechischen Sprache* (Leipzig, 1831) has the following features: documentation of a word's history from its first occurrence, analysis of lexical meaning in terms of components, grouping together compounds and derivations, stating semantic relations between different senses of polysemous words, listing in alphabetical order. Passow's dictionary was revised by Friedrich Rost (Leipzig 1841–1857) and by Wilhelm Crönert (Göttingen, 1912–1914). In France, M. A. Bailly published the *Dictionnaire Grec-Français … à l'usage des élèves des lycées et des collèges* (Paris, 1894), which was revised by L. Séchan and P. Chantraine (Paris, 1963, 26th edn.).

In England Henry George Liddell and Robert Scott published their *Greek-English Lexicon* in 1843. First intended as a translation of Passow, it was enriched with a great deal of new material. They worked on it

In the 1st century A.D., the Alexandrian grammarian Pamphilos compiled a glossary, *Λεξικόν* (*Lexicon*), consisting of 95 books. Shorter versions of this work (epitomes) were produced by the grammarians Diogenianos (2nd century) and Hesychius of Alexandria (5th century) (edited by K. Latte, 1861). During the Byzantine era, Photios, Patriarch of Constantinople (9th century), compiled glossaries and etymological dictionaries. *Suda* (or *Suidas*) (10th century) is a combined glossary and encyclopedia (edited by A. Adler, 1928).

In Hellenistic times, after the conquests of Alexander the Great (4th century B.C.) the various Greek dialects were replaced by a common form of Greek (Koiné), which developed from the Attic dialect. In the 2nd century A.D. the Atticist movement, a reaction against the Koiné, required that good style entailed writing in the pure Attic dialect of the 5th and 4th centuries B.C., the language of the classical authors. In this tradition, puristic dictionaries were created for the first time, including words found in classical authors and neglecting words from the Koiné, the contemporary language. Such is the dictionary of Phrynichos. An exception is a synonymic dictionary, *Onomasticon*, by Ioulios Polydeukes (Pollux) (edited by E. Bethe, 1900).

Modern Lexicography

The Renaissance milestone for Greek lexicography is the *Thesaurus Graecae Linguae* (Paris, 1572) of Henri Estienne (or Henricus Stephanus). This vast dictionary gives Latin equivalents for Greek words, covering most classical Greek authors and providing citations that illustrate the context of the different senses and etymologies. The words are arranged not in strict alphabetical order, but grouped into derivational word families. Many dictionaries of the 17th and 18th centuries were based on Estienne's work, using modern vernaculars as the metalanguage.

The most important of these is Johann Gottlob Schneider's *Kritisches Griechisch-Deutsches Handwörterbuch* (1797–1798). Franz Passow developed this work in several stages; its final form, the *Handwörterbuch der griechischen Sprache* (Leipzig, 1831) has the following features: documentation of a word's history from its first occurrence, analysis of lexical meaning in terms of components, grouping together compounds and derivations, stating semantic relations between different senses of polysemous words, listing in alphabetical order. Passow's dictionary was revised by Friedrich Rost (Leipzig 1841–1857) and by Wilhelm Crönert (Göttingen, 1912–1914). In France, M. A. Bailly published the *Dictionnaire Grec-Français … à l'usage des élèves des lycées et des collèges* (Paris, 1894), which was revised by L. Séchan and P. Chantraine (Paris, 1963, 26th edn.).

In England Henry George Liddell and Robert Scott published their *Greek-English Lexicon* in 1843. First intended as a translation of Passow, it was enriched with a great deal of new material. They worked on it

throughout their lives, producing six editions together (6th edn. in 1869), and Liddell produced two further editions. The 9th edition (*Liddell-Scott-Jones, LSJ*) was edited by Henry Stuart Jones (1925–1940), a *Supplement* was published by E. A. Barber in 1968, and a *Revised Supplement* by W. Glare in 1996. *LSJ* covers the whole surviving body of Greek literature from Homer to the 6th century A.D. It cites contexts of attestation of words for all senses. It does not include Christian authors and proper names, but is still the most complete Greek dictionary available.

The *Diccionario Griego-Español* edited by Francisco Adrados is even more comprehensive, including words from texts not in *LSJ*, such as Mycenaean Greek, Christian writers, place names, and words in inscriptions, papyri, and ostraca. The dictionary covers the period from Homer to 600 A.D. but also contains some Byzantine material based on selected documents which follow the classical tradition. Between 1980 and 2004, six volumes were published (α-*έκπελεκάω*), and the work continues.

With regard to Christian literature in Greek, Walter Bauer edited the *Griechisch-Deutsches Wörterbuch zu den Schriften des Neuen Testaments und der übrigen urchristlichen Literatur* (Gießen, 1928) which was translated into English by Arndt and Gingrich in 1957 and Gingrich and Danker in 1979. The 6th edition by Kurt Aland and Barbara Aland (Berlin, 1988) is a comprehensive revision. The *Patristic Greek Lexicon* edited by G. W. H. Lampe (Oxford, 1961) covers words used by Christian authors from the 1st to the 9th century A.D.

Special Dictionaries

Apart from dictionaries of individual authors, notable and valuable dictionaries include Wilhelm Pape's dictionary of proper names (Pape and Benseler, 1880), Friedrich Preisigke's *Wörterbuch der griechischen Papyrusurkunden* (Berlin, 1925–1931). The *Lexikon des frühgriechischen Epos* was initiated by Bruno Snell. It contains all words including proper names in Homer, Hesiod, and other early hymns and poetry. Mycenaean Greek is covered in Anna Morpurgo's *Mycenaeae Grecitatis Lexicon* (1963) and the *Diccionario micénico* edited by Francisco Aura Jorro (in progress). In 1992 Franco Montanari initiated the Poorly Attested Words in Ancient Greek project, a databank in the form of an electronic dictionary containing words that are only scantily attested (one or few occurrences), inadequately documented or formally and semantically problematic.

Etymological Dictionaries

The *Grundzüge der griechischen Etymologie* of Georg Curtius (Leipzig 1858–1862) served as input to the early Liddell-Scott. The standard references now are the *Griechisches etymologisches Wörterbuch* by Hjalmar Frisk (Heidelberg, 1960–72) and Pierre Chantraine's *Dictionnaire étymologique de la langue grecque* (Paris, 1968–1980).

Byzantine Greek

Postclassical and Byzantine Greek are lexicographically recorded by Du Cange (1688). E. A. Sophocles' *Greek Lexicon of the Roman and Byzantine Periods* (1870) covers the vocabulary of nonclassical authors between 146 B.C. and 1100 A.D. The *Lexikon zur byzantinischen Gräzität* (*LBG*), currently edited by Erich Trapp (Bonn/Vienna), will fill the lexicographic gap between the 9th and 12th century by including literary and scientific texts as well as documents and other selected sources. The first volume (A–K) was published in 2001.

The Beginnings

Until the 16th century and beyond, it was not considered worthwhile to make collections of the vocabulary of contemporary Greek, which was regarded as an inferior form of the language. The first dictionaries of post-classical Greek were published outside Greece and were bi- or multilingual. Dictionaries of this time served either practical needs or scholarly interests. The first collection of vernacular Greek vocabulary was *Corona preciosa* (Venice, 1527), a small handbook for merchants in which Greek headwords were translated into Latin and Italian. The first dictionary of the vernacular, *Glossarium Graeco-Barbarum*, published in 1610 by Ioannes Meursi (Jan van Meurs) in Lyon, provided definitions of contemporary terms in Latin and Ancient Greek. Simon Portius published a trilingual dictionary of Modern Greek, Ancient Greek, and Latin (Paris, 1635). For the practical needs of Jesuit missionaries, the Jesuit monk Girolamo Germano published the *Vocabulario italiano et greco* (Rome, 1622), the first bilingual Greek-Italian dictionary. The *Thesaurus* of Gerasimos Vlachos (Venice, 1659) translated Modern Greek headwords into Latin, Italian, and French. The *Glossarium ad scriptores mediae et infimae Graecitatis*, by Du Cange (Lyon, 1688), contained words (scholarly and vernacular) and examples from medieval and contemporary written texts with definitions in Ancient Greek and Latin. It is still regarded as a major work of scholarship.

During the 18th century, dictionaries were compiled serving educational and commercial needs. The most important of these was Alessio da Somavera's Greek-Italian and Italian-Greek dictionary, *Tesoro della lingua greca-volgare ed italiana* (Paris, 1709). This work, ahead of its time, contained a rich collection of contemporary vernacular words with lists of synonyms in Greek and many collocations that showed the use of words in context.

The 19th Century

In the period preceding the Greek War of Independence, dictionaries were compiled for educational purposes, out of the publishers' desire to promote cultural identity. But the language covered was not the vernacular.

The first Greek scholar to compile and publish a dictionary inside Greece was Skarlatos Vyzantios. His dictionary (1835) translated Modern Greek words into Ancient Greek and French. It included an appendix of loanwords that he believed should have been expelled from the language. Despite the dictionary's conservative ideology, it was a considerable achievement. It provided grammatical information as well as collocations and examples of words in use.

In the years that followed, persistent controversies about "the language question" brought lexicography to a standstill. For the next 100 years, only bilingual dictionaries were compiled, and even these covered only the Katharevousa vocabulary. An exception was Stephanos Koumanoudis's dictionary of neologisms, *Συναγωγή νέων λέξεων υπό των λογίων πλασθεισών* (1900), a collection of about 60 000 words (ca. 1750–1900), with the date of each word's first attestation.

The 20th Century

Historical Dictionaries

The *Ιστορικόν Λεξικόν της Ελληνικής Γλώσσης* (*Historical dictionary of the Greek language*), compiled and published by the Academy of Athens, was based on the idea of Georgios Hatzidakis in 1908 to create a dictionary of the whole Greek language: Ancient, Medieval, and Modern, both standard and dialects. When it became clear that this goal was unachievable, emphasis was laid on the language from 1800 and especially the dialects. From 1933 to 1989, five volumes were published (reaching *δαχτυλωτός*). Since 2003, the dialectal material has been the only focus of the project.

Dimitrios Dimitrakos's *Μέγα Λεξικόν της ελληνικής γλώσσης* (*Comprehensive dictionary of the Greek language*) (nine volumes, 1936–1950) also had a diachronic focus, from Homer to the 20th century. It is written in Katharevousa and is based on existing dictionaries of Ancient Greek.

Dictionaries of Mixed Type

The *Προϊα* (*Proia*) (1933) was the first compendious and systematic monolingual dictionary. It was a dictionary of both the official language of the time (Katharevousa) and the spoken and literary form (Demotic). The definitions are in Katharevousa, but many examples show Demotic usage. The *Λεξικόν της νέας ελληνικής* (*Dictionary of Modern Greek*), by Ioannis Stamatakos (three volumes, 1952–1955), contained words mainly from Katharevousa. The definitions were written in Katharevousa. It often gives Ancient Greek equivalents.

Dictionaries of Standard Modern Greek

In 1976 Demotic was established as the official language, and the need for new dictionaries became urgent. The first serious attempt to publish a synchronic dictionary of the modern language was the dictionary of Tegopoulos and Fytrakis (1989); it was a list of contemporary words, though it omitted words that were no longer used but that were recorded in other dictionaries.

From the 1990s, Greek lexicography was enriched by compendious dictionaries. The *Λεξικό της Νέας Ελληνικής Γλώσσας* (*Dictionary of the Modern Greek language*), of Georgios Babiniotis appeared in 1998 (second edition, 2002). This dictionary was conceived as a collection of cultural information and provides a lot more information than is typical for dictionaries. It is a prescriptive dictionary (cf. the subtitle, *With comments on the correct usage of words*), with comments on the differences between near-synonyms, cognates, homonyms, orthographic variants, etc. It also presents extensive etymological information going back to Indo-European.

Scholars of the University of Thessaloniki, known for their demoticist ideology, have made a major contribution to Greek lexicography. One of the first dictionaries was Nikolaos Andriotis's *Ετυμολογικό λεξικό της κοινής νεοελληνικής* (*Etymological dictionary of common Modern Greek*) (1951, 1983), which focused from the beginning on standard Modern Greek only and is one of the most authoritative sources. Emmanouel Kriaras's *Λεξικό της σύγχρονης ελληνικής δημοτικής γλώσσας* (*Dictionary of the contemporary Demotic language*) (1995) was a serious lexicographic treatment of standard Modern Greek, and his monumental *Dictionary of medieval vulgar Greek literature, 1100–1669*, covered popular literature (written in the vernacular) of the late Byzantine and the early post-Byzantine period. The project continues, and an abridged version has already been prepared.

The *Λεξικό της Κοινής Νεοελληνικής* (*Dictionary of the common Modern Greek language*) (1998) of the Institute of Modern Greek Studies (INS), in Thessaloniki, is a scholarly descriptive dictionary of the modern language "as spoken by the average Greek of today, as written in modern Greek prose and in the daily and periodical press, as heard on radio and television." (Introduction, p. *ια*') Based on modern lexicographic and linguistic principles, it provides morphological information and paradigms, syntactic information, and many examples for senses and collocations. Its etymologies are authoritative. It was the first monolingual Greek dictionary to include phonetic transcriptions.

Anna Anastassiadis-Syméonidis (2002) edited the *Αντίστροφο λεξικό της νέας ελληνικής* (*Reverse dictionary of Modern Greek*), which contains 180 000 lemmas.

The Greek-English dictionary, compiled by Dimitrios Georgacas from the late 1960s to his death in 1990 was based exclusively on his archive, a corpus of Greek literary texts from the 19th and 20th centuries. It gives phonetic transcriptions, English definitions, examples with quotations from the literary corpus, and a historical and etymological part. Although only letter A was completed, the dictionary is a major work of bilingual lexicography and scholarship.

The Electronic Lexicography Department of the Institute for Language and Speech Processing in Athens has developed monolingual and multilingual electronic dictionaries for educational purposes, and electronic dictionaries of Greek Sign Language.

Other Types of Dictionaries

The *Αντίστροφον λεξικόν της νέας ελληνικής* (*Reverse dictionary of Modern Greek*), by Georgios Kourmoulis (1967), was the first reverse dictionary of Greek. It covers both Katharevousa and demotic. The *Αντιλεξικόν ή Ονομαστικόν της νεοελληνικής γλώσσας* of Theologos Vostantzoglou (1967), with 60 000 words, is an onomasiological dictionary modeled on Roget's *Thesaurus*. Special dictionaries include the slang dictionary *Λεξικό της πιάτσας*, by E. Zachos (1981).

Many glossaries and dictionaries exist for Greek dialects, of which two publications of the dialectal studies in the Academy are Anastasios Karanastasis's *Ιστορικόν λεξικόν των ιδιωμάτων της Κάτω Ιταλίας* (*Historical dictionary of the Greek dialects of southern Italy*) (five volumes, 1986–1992), and Athanasios Kostakis's *Λεξικό της τσακωνικής διαλέκτου* (*Dictionary of the Tsakonian dialect*) (three volumes, 1987).

External History

Attested from the 14th century B.C., Greek has continued in an unbroken line of development down to the present day, the 'ancient' period coming to a close around 300 A.D. with the end of Hellenistic Greek. In the 1700 years from the Mycenaean period to the *koinē* and beyond, the language underwent significant changes in phonology, morphology, syntax, and lexicon. A member of the Indo-European family of languages, Greek has particular affinities with Indo-Iranian; its connections with Latin, once thought to be so close, in fact largely reflect cultural interaction, rather than subgrouping features.

We do not know when the language entered Greek lands, but it was in use on the mainland and on Crete in the second half of the second millennium B.C. During the first millennium, it was spoken, in one form or another, on the Greek mainland; the Aegean islands, including Crete, Cyprus, and Rhodes; in parts of Asia Minor; and in southern Italy and northern Africa. From earliest times, Greek existed as a collection of dialects, with Attic, the dialect of Athens, eventually dominating and serving as the foundation for the Hellenistic *koinē* and its further development into later stages of the language.

Dialects

Mycenaean

Mycenaean Greek was written in a syllabic script on clay tablets used for record keeping in the Bronze Age centers on the Greek mainland and on the island of Crete. Deciphered only in 1952, these documents, although they contain no literature (which presumably at this time was still maintained exclusively in an oral tradition) and (owing to the nature of their contents) offer only limited evidence particularly of syntax and verb morphology, nevertheless provide us with an invaluable source of information regarding the development of Greek from Proto-Indo-European. Although the Linear B syllabary does not mark all contrasts (e.g., one series of signs represents both [l] and [r], and there is no differentiation of [k], [k^h], and [g]; of [p] and [p^h]; or of [t] and [t^h], although both voicing and aspiration were phonemic in the language), the script does provide a series of signs for the labiovelars (PIE $*k^w$, $*g^w$, $*g^{wh}$), which by the time of alphabetic Greek in the 8th century B.C. had developed into the phonologically conditioned series of stops [p, b, p^h/t, d, t^h/k, g, k^h].

'Historical' Dialects

The dialectal status of Mycenaean is disputed. We know that it was not the only variety of Greek spoken in the second millennium because it shows innovations not shared by all of the later-attested dialects, such as assibilation of *–t* before *-i*); debate continues as to whether it should be grouped unqualifiedly with any of the so-called historical dialects attested in the first millennium (and, with the exception of Cypriot, written in an alphabetic script), although its affinities with Arcado-Cypriot are clear. The dialects are grouped as follows: Attic-Ionic (in Attica and its chief city Athens, the Ionic islands of the Aegean, and parts of Asia Minor), Aeolic (including Boiotian, Thessalian, and Lesbian), Doric (or West Greek, in the Peloponnese, the Doric islands of the Aegean, and parts of Asia Minor), Northwest Greek (on the northern mainland), and Arcado-Cypriot (in Arcadia and Cyprus). The old view, supported by the testimony of the ancient Greeks themselves, that the dialects entered Greece in three successive waves – Attic-Ionic, Aeolic with Arcado-Cypriot, and Doric with Northwest Greek – has recently been challenged by a model that locates the dialectal differentiation in Greece itself during the course of the second millennium.

'Literary' Dialects

Certain dialects or conventionalized forms of them were associated with certain genres of literature. Thus, regardless of the native dialect of a given

External History

Attested from the 14th century B.C., Greek has continued in an unbroken line of development down to the present day, the 'ancient' period coming to a close around 300 A.D. with the end of Hellenistic Greek. In the 1700 years from the Mycenaean period to the *koinē* and beyond, the language underwent significant changes in phonology, morphology, syntax, and lexicon. A member of the Indo-European family of languages, Greek has particular affinities with Indo-Iranian; its connections with Latin, once thought to be so close, in fact largely reflect cultural interaction, rather than subgrouping features.

We do not know when the language entered Greek lands, but it was in use on the mainland and on Crete in the second half of the second millennium B.C. During the first millennium, it was spoken, in one form or another, on the Greek mainland; the Aegean islands, including Crete, Cyprus, and Rhodes; in parts of Asia Minor; and in southern Italy and northern Africa. From earliest times, Greek existed as a collection of dialects, with Attic, the dialect of Athens, eventually dominating and serving as the foundation for the Hellenistic *koinē* and its further development into later stages of the language.

Dialects

Mycenaean

Mycenaean Greek was written in a syllabic script on clay tablets used for record keeping in the Bronze Age centers on the Greek mainland and on the island of Crete. Deciphered only in 1952, these documents, although they contain no literature (which presumably at this time was still maintained exclusively in an oral tradition) and (owing to the nature of their contents) offer only limited evidence particularly of syntax and verb morphology, nevertheless provide us with an invaluable source of information regarding the development of Greek from Proto-Indo-European. Although the Linear B syllabary does not mark all contrasts (e.g., one series of signs represents both [l] and [r], and there is no differentiation of [k], [k^h], and [g]; of [p] and [p^h]; or of [t] and [t^h], although both voicing and aspiration were phonemic in the language), the script does provide a series of signs for the labiovelars (PIE $*k^w$, $*g^w$, $*g^{wh}$), which by the time of alphabetic Greek in the 8th century B.C. had developed into the phonologically conditioned series of stops [p, b, p^h/t, d, t^h/k, g, k^h].

'Historical' Dialects

The dialectal status of Mycenaean is disputed. We know that it was not the only variety of Greek spoken in the second millennium because it shows innovations not shared by all of the later-attested dialects, such as assibilation of *–t* before *-i*); debate continues as to whether it should be grouped unqualifiedly with any of the so-called historical dialects attested in the first millennium (and, with the exception of Cypriot, written in an alphabetic script), although its affinities with Arcado-Cypriot are clear. The dialects are grouped as follows: Attic-Ionic (in Attica and its chief city Athens, the Ionic islands of the Aegean, and parts of Asia Minor), Aeolic (including Boiotian, Thessalian, and Lesbian), Doric (or West Greek, in the Peloponnese, the Doric islands of the Aegean, and parts of Asia Minor), Northwest Greek (on the northern mainland), and Arcado-Cypriot (in Arcadia and Cyprus). The old view, supported by the testimony of the ancient Greeks themselves, that the dialects entered Greece in three successive waves – Attic-Ionic, Aeolic with Arcado-Cypriot, and Doric with Northwest Greek – has recently been challenged by a model that locates the dialectal differentiation in Greece itself during the course of the second millennium.

'Literary' Dialects

Certain dialects or conventionalized forms of them were associated with certain genres of literature. Thus, regardless of the native dialect of a given

author, dactylic hexameter poetry (epic, etc.) was predominantly in Ionic with a heavy admixture of Aeolic, choral poetry was in Doric, the dialogue of Athenian tragedy was in Attic (the choral lyrics were in Doric), and so on.

Phonology

Vowels

The phonological system included 10–12 vowels, subject to dialect variation: the short vowels [a, e, o, i, u] (with [u] fronted to [y] in Attic) and the long vowels [a:, e:, o:, i:, u:] (with [u:] fronted to [y:] in Attic). In addition, some dialects, including Attic, distinguished long open *e* and *o* (ɛ: and ɔ:), in addition to [e:] and [o:]. The situation was further complicated by the orthography (e.g., the long close *e* [e:] that arose from compensatory lengthening fell together with the original long *e* in some dialects and was written η, the pronunciation of which varied from higher to lower position in different dialects). Other dialects, which distinguished [e:] and [ɛ:], wrote the latter as η, the former as ει, a sign that had earlier represented the diphthong [ej] but had subsequently been reduced to a monophthong, thus allowing for the use of the digraph to represent compensatorily lengthened [e:] as well. Similarly, [o:] was written ου in those dialects that distinguished [o:] and [ɔ:] (ω). Four diphthongs remained in frequent use: [aj, oj, aw, ew] (written αι, οι, αυ, ευ). The status of υι is uncertain. The 'long' diphthongs [a:j, e:j, ɔ:j] (written αι, ηι, ωι or, with iota subscript, a Byzantine innovation, ᾳ, ῃ, ῳ) generally lost the glide or merged with the short diphthongs.

The Indo-European vocalic resonants **r̥ *l̥ *m̥, *n̥*, yielded vowel reflexes or vowel and consonant combinations (e.g., **n̥ > α/αν, *r̥ > αρ/ρα/ορ/ρο*).

A major dialectal feature of Ionic and, with exceptions, Attic is the raising of inherited [a:] to [ɛ:] (written η).

Consonants

There were nine stops, grouped in three points of articulation – labial, dental, velar – with each point of articulation having three types: voiceless, voiceless aspirate, and voiced: [p, p^h, b/t, t^h, d/k, k^h, g]. There were four resonants – the liquids [l, r] and the nasals [m, n] – and two fricatives: the dental [s] (with a voiced allophone [z] before voiced consonants) and the glottal [h], the so-called rough breathing (marked ') in word-initial position before some vowels, e.g., Ἑλλάς (*Hellas*), ἅγιος (*hagios*) 'holy', and before *r*, e.g., ῥόδον (*rhodon* 'rose') (where it may indicate not aspiration but a voiceless pronunciation). Initial [h] arose as a development from earlier [s], [j], etc. The velar nasal [ŋ] occurred as an allophone of [n] before velars and was usually written γ, e.g., ἄγγελος (*angelos*), cf. Eng. 'angel'. In the liquids λ represented a dental lateral [l], and ρ in non-initial position was apparently a voiced rolled *r*, as in, e.g., Italian. The three letters ζ, ξ, and ψ represented consonant clusters. The sound represented by ζ seems to have varied in different dialects and at different periods from [dz] to [zd], eventually simplifying to [zz] or [z]; ξ represented [ks] and ψ [ps]. The voiced semivowel [w], widely attested in Mycenaean, was dropped early in Attic-Ionic (cf. Myc. *wa-na-ka* = Hom. and Att. *anaks* ἄνακξ), but was retained by some dialects well into the historical period, where it was represented by the letter *digamma* (Ϝ).

The loss of digamma and of intervocalic *s*, etc., resulted in the vowel contractions characteristic of the later language. Many morphophonemic changes resulted in complex developments, particularly of consonant clusters. Constraints on word-final consonants left only final *-r, -s, -n*. The aspirated stops [p^h, t^h, k^h] developed by the later period into the corresponding fricatives [f, θ, χ].

Accent

Ancient Greek had a pitch accent: rising (acute ′), falling (grave ˋ), or rising-falling (circumflex ˆ), the latter restricted to long vowels and diphthongs. The accent was 'free,' subject to certain phonological and morphological constraints; it fell only on one of the last three syllables of a word and was recessive in verbs (a residue of an early stage in which the verb of a main clause was cliticized).

Morphology and Syntax

Ancient Greek has a very rich derivational and inflectional morphology. Use is made of prefixes, very rarely of infixes, and overwhelmingly of suffixes. Derivational processes depend primarily on composition and suffixation. The verbal morphology is especially complex.

Morphosyntax of Nominals

Ancient Greek has three declensional classifications for nouns and adjectives: *o*-stems, ᾱ-stems, and consonant stems. There are five cases (nominative, genitive, dative, accusative, vocative), three numbers (singular, dual, plural), and three genders (masculine, feminine, neuter). There are remnants of an instrumental case (e.g., the suffix *-phi* in Mycenaean and Homeric Greek) and the locative (e.g., *oikoi* 'at home'); otherwise, the functions of the locative, instrumental, and ablative cases reconstructed for

Proto-Indo-European are taken over by the genitive and dative in Greek. The dual category, already unstable in Homer, was eventually largely eliminated. Grammatical gender was not necessarily determined by natural gender; although terms for males and females were as a rule masculine and feminine, respectively, this was not exclusively the case, and inanimate objects could be categorized indiscriminately as masculine, feminine, or neuter.

Morphosyntax of Verbs

The verbal morphology encodes many morphosyntactic categories. Finite forms are marked for person and number; nonfinite forms include infinitives, participles, and other verbal adjectives. In addition to person and number, finite verbs are marked for tense, aspect, voice, and mood. The complexity of the Greek verbal system arises from its retention of the already complex system of Proto-Indo-European (PIE), to which is added a number of new categories of tense/aspect and voice (e.g., the future, the pluperfect, further contrasts of active, middle, and passive, etc.), and innovations in the aspectual status of the aorist and perfect. Thus, the PIE aspectual opposition of present/aorist/perfect, indicating, respectively, imperfective, perfective, and stative aspect, was maintained to a great extent, especially in the nonindicative moods and the nonfinite forms. However, in the indicative 'tenses,' the opposition of present/aorist/perfect was combined with distinctions of time that eventually overshadowed the original distinctions of aspect so that the aorist could be used simply as a past tense and the perfect came to develop a resultative use.

The tenses are present, imperfect, aorist, perfect, pluperfect, future, and future perfect. The categories of voice are active, middle, and passive (the middle indicating close involvement of the subject in the action, e.g., reflexive usage, etc.). The moods are indicative, subjunctive, optative, and imperative.

The Indo-European process of morpheme-internal vowel gradation (*Ablaut*), e.g., *e/o/Ø*, etc., was widely used in Greek. What began as a phonological process was morphologized already in the pre-PIE period and yielded many distinctions in both nouns and verbs in Greek, for example, the distribution seen in the following forms built on the root **pet* 'fly': *pétomai* 'fly,' *potḗ* 'flight,' and *pterón* 'wing'; within the verbal paradigm, examples are present *peíthō* 'I persuade,' perfect *pépoitha* 'I am persuaded.'

Syntactic Typology

Ancient Greek has a relatively free word order that resists simple classification in terms of SOV, SVO, and so on. More fruitful is a recent approach (Devine and Stephens, 2000) that sees the syntactic typology of Ancient Greek as changing from an earlier nonconfigurational type to configurationality, from a syntax of juxtaposition to a syntax of government and embedding. Particularly in its earlier stages (and in archaizing poetic traditions), Greek made pervasive use of discontinuous constituency, adjunct lexical arguments, null anaphora, and parataxis. Thus, the language of the Homeric poems, which were recorded in writing in the 8th or early 7th century B.C., but represent a prior oral tradition of a thousand years or more, is heavily paratactic, whereas 4th-century Attic prose is, by contrast, markedly hypotactic, with complex forms of subordination.

Specific features of interest in Greek syntax include the use of particles, the distribution of clitics, and the development of the article.

Greek, Modern

B D Joseph, Ohio State University, Columbus, OH, USA

General Overview

Although very much a living and vibrant language with speakers numbering in the millions around the world, Modern Greek actually began to develop thousands of years ago, when speakers of the ancient form of the language entered the Balkan peninsula some time in the early part of the second millennium B.C. These speakers moved quickly, according to most current accounts, into the southern part of the region – what is now northern and central Greece and the Peloponnesos – and into most of the neighboring islands of the Aegean Sea, including Crete as the most southerly point. This settlement area essentially defines the space where to this day the Greek language remains an enduring presence, though there has been spread into other areas, in some cases dating from ancient times.

Modern Greek is the official language of the Hellenic Republic (i.e., the Republic of Greece) where there are some 11 000 000 speakers, and also of the Republic of Cyprus, with some 600 000 speakers. In large part because of ancient colonization, Greek is found today in numerous communities and enclaves around the Mediterranean and Black Sea area, including Sicily, southern Italy, Alexandria (Egypt), and the region around the Crimean peninsula. Moreover, Greeks in modern times have migrated to many locations throughout Europe (but especially England), Australia (with a large concentration around Melbourne), and North America (particularly in New York, Chicago, Ohio, Florida, and Toronto), forming the modern-day 'Hellenic Diaspora.' Although Greek is mainly a second language in these diaspora communities, it is still robust and alive there, and these communities add perhaps as many as 2 500 000 speakers to the overall total of speakers of Greek worldwide.

The language is generally referred to as 'Greek' in English, but the linguistic autonym for Greek speakers is based on an entirely different root. Greek speakers call their language *eliniká* (i.e., 'Hellenic') or *neoeliniká* (i.e., 'neo-Hellenic'). Occasionally, the designation *roméika* is used also; it is literally, 'Romaic', a use deriving from the affinities many (Orthodox Christian) Greeks have felt for the Eastern Roman (or Byzantine) Empire, centered in Constantinople after the 4th century A.D.

The modifier 'modern' is generally used in referring to the language in English, in much the same way that the Greeks themselves often use *neo-*, literally 'new', in their self-designation (*neoeliniká*, as above). Indeed, the unadorned label 'Greek' in English usually refers to the ancient language. This usage recognizes the fact that the language has a long and rich documented history, being attested as early as the 14th century B.C. (so-called Mycenaean Greek) and continuing through ancient times and the Byzantine era up to modern times.

The modern form of the language is significantly different from its ancient Greek predecessor with regard to pronunciation and general structural features, but at the same time, as perhaps with all languages, there is noticeable continuity as well. The changes that set Modern Greek apart from the ancient language (e.g., the falling together of some eight distinct vocalic nuclei to [i], the shift from a pitch accent to a stress accent, a greater degree of analyticity in nominal and verbal constructions for earlier synthetic ones, among others) can be seen in nascent form in the period of the Hellenistic Koine. By the 10th century A.D., the language in many respects had a quite modern look to it. Still, it is customary to date the modern period of Modern Greek to approximately the 17th century, recognizing that even in the so-called Medieval Greek period, some structural differences from contemporary Greek were to be found (e.g., syntactically in the continued use of an infinitive, morphologically in the formation of the future tense, and phonologically in the expansion of a dental affricate and the elimination of a front rounded vowel), as well as numerous lexical differences.

Dialects of Modern Greek

Taken as a whole, Modern Greek exhibits great diversity across all its varieties, defined both geographically and socially. However, the considerable differences are largely masked by the dominance and ubiquity of the standard language, the variety that reflects the everyday usage of speakers in Athens and its environs, by far Greece's leading population center, with over 4 000 000 inhabitants, and the country's focal point for culture, economy, religion, and government.

Looking first at diversity from a geographic standpoint, the major modern regional dialects (following Newton, 1972a) that can be identified are Peloponnesian-Ionian Greek, traditionally viewed as the basis for the contemporary standard language; northern Greek, in a zone starting north of Attica

(where Athens is located) and extending up to and beyond Greece's second largest city, Thessaloniki; Cretan, the dialect of the island of Crete; Old Athenian, the dialect of Athens before the 1821 War of Independence and, as a result of various resettlements, found elsewhere in Greece into the early 20th century; and southeastern Greek, including Greek of the Dodecanese islands, as well as Cypriot Greek. However, modern Cypriot shows significant differences on all levels (phonological, morphological, and syntactic) that invite its classification as a separate language.

Two other important geographic varieties include (1) Tsakonian, the rather divergent form of the language, a direct descendant of the ancient Doric dialect that is spoken still in the eastern Peloponnesos; and (2) the Pontic dialects, which were once spoken along the Black Sea coast (Crimea area and Asia Minor), but are now mostly found in various parts of Greece as a result of the 1923 population exchanges with Turkey. Both Tsakonian and Pontic diverge significantly enough from the rest of Greek to merit consideration now as separate languages (though they are still clearly Hellenic).

Sociolinguistic Setting and Other Diversity

Geography and regional dialects account for only part of the diversity present in the Greek-speaking world; an additional crucial facet is the diglossia (in the sense of Ferguson, 1959) that Greek exhibits, as an outcome of centuries of cultural influence from the Classical Greek language and Classical Greece itself on modern speakers. Classical Greek and Classical Greece were treated as the prescriptive norms against which speakers of later stages of Greek generally judged themselves, resulting in a 'two-track system' for the language, with a consciously archaizing form that speakers and writers modeled on Classical Greek set against a vernacular innovative variety. With the founding of the new nation-state of Greece after the revolution of 1821, these two tracks developed into a significant register and stylistic difference between a high-style variety associated with official functions (those involving government, education, religion, and the like), known as *katharevousa* ('Puristic', literally 'the purifying' language), and the ordinary, day-to-day language of the people, known as *dimotiki* ('demotic', literally 'the popular' language). These two varieties vied for status as the primary form of the language; each had its advocates, for whom language attitudes tended to correlate with certain social attitudes and political positions, more conservative for advocates of *katharevousa* and more progressive for followers of *dimotiki*. The competition continued throughout most of the 20th century, with *katharevousa* generally being in the ascendancy for official use, but was resolved most recently by various governmental acts and actions in 1976 declaring *dimotiki* as the official language. Still, all throughout the various official and unofficial periods of diglossia, the usage that speakers exhibited has actually been mixed, showing borrowing between the two varieties, in particular with *katharevousa* forms incorporated into *dimotiki*. The present state of Standard Modern Greek is essentially *dimotiki*, but with significant borrowings from *katharevousa* involving grammar (morphology and syntax), pronunciation, and vocabulary.

Linguistic diversity for Modern Greek, therefore, involves the mixing of varieties of both a regional and stylistic/social nature and mutual interactions among them.

Structure of Modern Greek

Modern Greek's vowel system is fairly unremarkable, showing /i e a o u/ with no distinctive length or nasality. Consonants include /p t k f v θ ð s z x γ j r l m n t^s d^z/; /b d g/, although deriving in some analyses from underlying nasal plus voiceless stop combinations, are probably best taken as distinctive elements in their own right. Still, the consonants are somewhat overstocked with fricatives, by most typological standards.

Modern Greek has a distinctive stress accent, restricted to occurring only on one of the last three syllables in a word; to some extent, accent placement is tied to particular morphological categories, but in general there is some degree of unpredictability as to which of the final three syllables is to be stressed.

In its morphology, Modern Greek is for the most part synthetic and fusional, with grammatical endings marking two numbers (singular and plural) and four cases (vocative, nominative, accusative, and genitive, which covers some 'dative'-like functions) in the noun. In the verb, there is a complex interplay of realizations for tense (present, past, future), mood (indicative, imperative, subjunctive), aspect (perfective and imperfective, with the so-called perfect tense perhaps forming a third distinction), person (speaker, hearer, and other; that is, first, second, and third), and number (singular and plural). Endings carry most of the marking functions, but some categories are realized by prefixal (or prefix-like) elements, especially the future tense and subjunctive mood. Weak object pronouns under some analyses are considered to

be transitivity markers on the verb, thus possibly constituting a further inflectional category. Negation too might be considered to be realized via prefixal elements.

With regard to syntax, Modern Greek shows a significant degree of analyticity, even with its generally synthetic morphology. Sentential complementation is always via person- and number-marked finite clauses, as there is no infinitive proper in the language, and for some case functions, especially of the genitive case, prepositional phrases occur as alternatives. Word order is fairly free, responding more to pragmatic and discourse-related criteria, such as focus and topicalization, than to purely syntactic concerns. Dislocated elements are often cross-indexed, so to speak, on the verb through the use of agreeing weak pronouns (so-called object reduplication).

Much of what Modern Greek shows in the way of surface syntactic and morphological patterns that differs from Ancient Greek may be attributable to interactions between speakers of Greek and speakers of other neighboring languages in the Balkans during the medieval (i.e., pre-modern) period, though language-internal factors clearly played a major role too.

Greenberg, Joseph H. (1915–2001)

M Thomas, Boston College, Chestnut Hill, MA, USA

© 2006 Elsevier Ltd. All rights reserved.

Joseph Greenberg was a controversial, highly original, linguistic anthropologist and eminent scholar of language typology and universals, who also wrote about genetic relationships among languages.

As Greenberg himself (1986) tells the story, he started learning languages as a hobby. Before finishing high school in Brooklyn, NY, he had studied German, Latin, and Hebrew, picked up Yiddish, and taught himself some Classical Greek and Arabic. At Columbia, Greenberg took as many language courses as possible, then discovered comparative linguistics and anthropology late in his undergraduate years. A class with Franz Boas introduced him to Native American languages. He also developed an interest in Africa. Greenberg entered a doctoral program in anthropology at Northwestern, but also spent a year at Yale, where he was disappointed not to meet Edward Sapir, but did study with Leonard Bloomfield. He conducted fieldwork in Nigeria for his dissertation on the influence of Islam on African religions. Along the way he learned Hausa and puzzled over its relationship to other African languages. After five years in the Army, he accepted a position at the University of Minnesota. In 1947 he moved Columbia, then in 1962 to Stanford.

Thus, in his early career Greenberg was exposed to many languages, and to seminal figures in anthropology, American structuralism, and – through Roman Jakobson, at Columbia in the late 1940s – Prague School linguistics. All of these influences contributed to his distinctive approach to typology, universals, and genetic classification.

Greenberg's lifework may have first come to him when, as a self-taught adolescent learner of Arabic, he marveled at its similarity to Hebrew although "the reason for that similarity, of course, eluded me" (1986: 2). Greenberg devoted much of his career to defining cross-linguistic similarities and the reasons behind them. The mid-century American structuralists who trained Greenberg downplayed comparative and historical study of languages in favor of 'scientific' description. But Greenberg was reluctant to abandon his commitment to language comparison, or his curiosity about historical relations. He was attracted to Prague School contrastive studies and to Jakobsonian markedness and implicational relationships. On the other hand, he was enough of an American to question the rigor of European-style structuralism.

A breakthrough occurred for Greenberg in 1953, at a seminar where he presented descriptivist procedures for linguistic analysis to a mixed audience of scholars. After Greenberg spoke, the psychologist Charles E. Osgood responded mildly that, although those procedures seemed admirable, a more impressive goal would be for linguistics to discover "something that was true about all languages." To Greenberg, this comment "was to haunt me thenceforth and helped determine the direction of much of my future work" (1986: 13). With Osgood and James J. Jenkins, Greenberg wrote a 'Memoradum concerning language universals,' sketching out plausible universals. The memorandum was circulated among the linguists, psychologists, and anthropologists invited to a 1961 conference at Dobbs Ferry, NY, cohosted by Greenberg, to discuss language universals and their relevance to different disciplines.

The conference proceedings (Greenberg, 1966) include the memorandum and Greenberg's much-reprinted paper 'Some universals of grammar with particular reference to the order of meaningful elements,' initiating what is now recognized as Greenbergian typology. Working from published grammars, Greenberg surveyed 30 languages to distill 45 generalizations about word order, morphology, and the syntax of questions and subordination. Greenberg's universals are implicational ("If the nominal object always precedes the verb, then verb forms subordinate to the main verb also precede it"), or statistical ("With overwhelmingly greater than chance frequency, languages with normal SOV order are postpositional"), or absolute ("All language have pronominal categories involving at least three persons and two numbers"). Having identified 45 such universals, Greenberg speculated about how these facts pattern together to create coherent language types, and cautiously suggested some overarching typological principles. But his text is essentially a list of numbered universals loosely arrayed by topic. Greenberg minimized the difficulties of identifying language features, making it appear easy to decide whether (for example) objects precede or follow verbs. Moreover, he did not justify his universals with respect to external generalities, or otherwise explain why they are what they are.

Greenberg's article promised a panoramic vision of what human languages share and how they differ, then worked toward that goal using accessible terms and concepts. It launched the Stanford Project on Languages, which continued from 1967 to 1976 under Greenberg's codirection. This large, collaborative project amassed phonological, morphological,

lexical, syntactic, and semantic generalizations, published in four volumes (Greenberg, 1978). Varied as these papers are, Greenberg's influence is evident throughout, in the priority of empirical accuracy over theoretical generalization, in the concern for cross-linguistic representation, and even in the convention of presenting the universals in numbered lists.

'Data-driven' Greenbergian typology has been coolly received by 'theory-driven' Chomskyan generativism. Generativists look deeply into small numbers of languages, or even a single language – deeply enough to locate properties instantiated in native speakers' knowledge of grammar, but which are incompletely displayed in the surface facts of everyday language. To generativists, mass cross-linguistic comparisons are unlikely to locate the subtle properties that define language differences; instead, they try to discover what speakers know about language that cannot be derived by observing its use in the environment. Greenberg, not one to retreat from controversy, responded to this critique by insisting that the two approaches are complimentary, and moreover, that explanations in linguistics require access to comparative and diachronic facts (1991). Critics notwithstanding, Greenberg opened the way for modern linguistic typology, now developed richly by such varied scholars as Bernard Comrie, Matthew Dryer, John A. Hawkins, and Hansjakob Seiler.

Greenberg's research on the genetic classification is likewise both original and controversial. For Greenberg, the two branches of his work cohere; typological discoveries inform genetic research and vice versa. Greenberg brought his familiar data-intensive, low-tech, working style to bear on the classification of languages. Despite sometimes harsh criticism, he developed a technique of 'mass comparison,' searching the morphology and lexicon of many languages for shared sound/meaning correspondences. Greenberg painstakingly filled notebooks, in pencil, comparing the words and features of diverse languages. By this technique (and excluding nonlinguistic and typological evidence), Greenberg (1966) concluded that African languages comprised four families: Afroasiatic, Khoisan, Niger-Kordofanian, and Nilo-Saharan. His claim first scandalized Africanists, but has gradually achieved full acceptance.

Greenberg subsequently investigated the languages of Central and South America, Oceania, Australia, and Native America. His syntheses of large numbers of languages into small sets of families have been greeted with increasing skepticism. Scholars objected that his criteria for similarity were obscure, and that he ignored the gold standard of genetic proof, comparative reconstruction (Campbell, 1988). Moreover, some complained about factual errors (e.g., reviews in Greenberg, 1987). Undaunted, Greenberg's final work carried his method forth to postulate a breathtakingly comprehensive, 'Eurasiatic' family comprising Indo-European, Uralic, Altaic, Eskimo-Aleut, and other northern Asian languages. On his deathbed, Greenberg regretted having not worked on Southeast Asian languages. They alone remain unintegrated into his synthetic vision of the relatedness of human languages.

Greenberg (1971, 1990) reprint his varied shorter writings; Croft (2001) provides a bibliography of the later works. Greenberg, Croft, Denning, and Kemmer's (1990) Festschrift displays the range of Greenberg's influence.

Greenland, the world's largest island, is 81% covered with ice. Towns are found on the coast, mainly on the southern coast, where also the capital Nuuk (or Godhab) is situated. Greenland has a population of 56 000. Greenland was part of Denmark until 1979, when it became autonomous.

The main languages of Greenland are Greenlandic (Inuktitut), an Inuit language of the Eskimo-Aleut family, and Danish (with around 8000 speakers). Greenlandic falls into three major dialects, East, North, and West Greenlandic. North Greenlandic has fewer than 1000 speakers, and East Greenlandic around 3000 (Grimes, 2004), so that West Greenlandic with more than 40 000 speakers is the main dialect. There is also a substantial Greenlandic-speaking community in Denmark. Most Greenlandic speakers also speak Danish. Both Greenlandic and Danish are used in schools.

Greimas, Algirdas J.: Theory of the Sign

P Perron, University of Toronto, Toronto, Ontario, Canada

© 2006 Elsevier Ltd. All rights reserved.

Greimas's theory of sign builds on Saussure's, in which a sign was defined as an entity made up of something physical – sounds, letters of the alphabet, gestures, etc., – the 'signifier'; and the image or concept to which the signifier refers – the 'signified.' He gave the name 'signification' to the arbitrary dyadic relation that holds between the two. He considered these three dimensions of the sign to be inseparable, and he stressed that the linguistic system was made up of differences so that the mechanisms of language rested on two types of relations: groups of elements of the written or oral chain whose values are defined in terms of the other elements of the system – 'syntagmatic relations'; and associative relations or relations between elements of the utterance and other elements absent from the utterance – 'paradigmatic relations' (e.g., the sign *black* takes on its value in terms of all the absent colors of the chromatic paradigm).

Although Greimas's definition of sign depends in part on Saussure's, Greimas reconceptualized Saussure's theory in terms of Louis Hjelmslev's theoretical works. Under Saussurian influence, the term 'sign' was commonly linked with the minimal sign, the word, or the morpheme, and it is in this sense that language was defined as a 'system of signs.' But Saussure's notion of sign was deemed by Hjelmslev and Greimas to be restrictive because Saussure at the same time defined the sign as a totality and then separated expression from the content when establishing his analytical procedures. To avoid this contradiction, Greimas reverted to Hjelmslev's redefinition of the sign, in which the semiotic function 'semiosis' is considered as the relation of reciprocal presupposition that exists between the expression-form and the content-form whereby meaning is created at the moment of the linguistic act.

For Greimas, contrary to Anglo-American linguists for whom the sign is a given, the sign is first and foremost a construct that excludes the referent as a necessary condition for the existence of linguistics (Greimas and Courtés, 1982: 297). Moreover, for Greimas, there can exist enunciate or discourse signs, and in a seminal article, he suggested that since signs can be redefined as the conjunction of an expression-form and a content-form of varying dimensions, "a word, a sentence are signs, but they are also discourse insofar as they can appear as discrete units. Initially, poetic discourse can be considered as a *complex sign*" (1972: 10, my translation). In his theoretical writings, Greimas attempted to work out an analytical methodology based on the relationship of reciprocal presupposition between expression-form and content-form. Just as phonemes and phemes are the distinctive features of the plane of expression, sememes and semes are the distinctive features of the plane of content, or the semantic plane. In his

Although Greimas's definition of sign depends in part on Saussure's, Greimas reconceptualized Saussure's theory in terms of Louis Hjelmslev's theoretical works. Under Saussurian influence, the term 'sign' was commonly linked with the minimal sign, the word, or the morpheme, and it is in this sense that language was defined as a 'system of signs.' But Saussure's notion of sign was deemed by Hjelmslev and Greimas to be restrictive because Saussure at the same time defined the sign as a totality and then separated expression from the content when establishing his analytical procedures. To avoid this contradiction, Greimas reverted to Hjelmslev's redefinition of the sign, in which the semiotic function 'semiosis' is considered as the relation of reciprocal presupposition that exists between the expression-form and the content-form whereby meaning is created at the moment of the linguistic act.

For Greimas, contrary to Anglo-American linguists for whom the sign is a given, the sign is first and foremost a construct that excludes the referent as a necessary condition for the existence of linguistics (Greimas and Courtés, 1982: 297). Moreover, for Greimas, there can exist enunciate or discourse signs, and in a seminal article, he suggested that since signs can be redefined as the conjunction of an expression-form and a content-form of varying dimensions, "a word, a sentence are signs, but they are also discourse insofar as they can appear as discrete units. Initially, poetic discourse can be considered as a *complex sign*" (1972: 10, my translation). In his theoretical writings, Greimas attempted to work out an analytical methodology based on the relationship of reciprocal presupposition between expression-form and content-form. Just as phonemes and phemes are the distinctive features of the plane of expression, sememes and semes are the distinctive features of the plane of content, or the semantic plane. In his

early writings, he extended the parallelism and came to the conclusion that, theoretically at least, a combination of 20 or so semic categories could generate a quantity of sememes that could satisfy totally the needs of a natural language. The phonological model, based on the premise of a fundamental parallelism between two planes of language as well as the variable dimension of signs, remains the organizational principal of Greimassian semiotics. Since signs on the plane of expression signify in terms of differential gaps, and the gaps of the signifier correspond to the gaps of the signified, which in turn are interpreted as features of signification, one can analyze the manifest visual, auditory, or tactile units and decompose them into minimal subunits of semes considered as semantic features. In a later work (1987), Greimas proposed a multilevel semiotic model or grammar of analysis known as actantial theory, which can account for the organization and transformation of the minimal subunits or minimal signs.

Formerly a French possession and subsequently an English colony, since 1974 Grenada has been an independent state within the British Commonwealth. It is situated in the Caribbean and is part of the Windward Islands. The official language of Grenada is English; 95% of the 89 357 inhabitants are literate and 5699 are deaf. People of older age speak a form of Lesser Antillean Creole French, Grenada Creole French, also known as Patwa or Patois. Grenada Creole English, also known as Carriacou Creole English, is the variety of Windward Caribbean Creole English spoken on Grenada, which presents a strong influence from French Creole. The 15 radio and two television stations broadcast principally in English.

Grice, Herbert Paul (1913–1988)

P P Chruszczewski, University of Wrocław, Wrocław, Poland

© 2006 Elsevier Ltd. All rights reserved.

Herbert Paul Grice was born on March 15, 1913 in Birmingham, England, into the family of Herbert and Mabel (née Felton) Grice. His father was a successful businessman who manufactured small metal items. Herbert Paul was educated at Bristol Clifton College and at Corpus Christi College at Oxford University. While in college, Grice combined the study of classics with philosophy and later became a lecturer in philosophy at St. John's College, where he was elected a fellow in 1939. During World War II, Grice served his country in the Navy, first in the North Atlantic, then from 1942 in Navy Intelligence at the Admiralty. After his military service, Grice returned to Oxford's St. John's College. At the end of 1967 he left for the University of California at Berkeley, where he taught and conducted research, obtaining full professorship in 1975. In 1980 Grice retired from his university position, but remained active in pursuing his linguistic and philosophical investigations.

Herbert Paul Grice is generally known for his two most influential papers, 'Meaning,' published in 1957, and 'Logic and Conversation,' published in 1975. In 'Meaning', he distinguishes between two types of meaning: (1) the 'natural' or 'observable' meaning and (2) the 'nonnatural' meaning, that is, the idiosyncratic meaning of a particular communicator. In 'Logic and Conversation,' Grice argues that in order to communicate people need to cooperate while exchanging verbal information and proposes the 'cooperative principle'; "Make your conversational contribution such as is required, at the stage at which it occurs, by the accepted direction or purpose of the talk exchange in which you are engaged" (Grice, 1975: 45).

The Gricean cooperative principle is subdivided into context-related maxims. According to the maxim of quantity, one should provide the listener with just the needed amount of information. The maxim of quality states that one should produce only texts that one believes to be true. One needs also to be relevant while communicating with others; and last but not least, one should communicate in a particular manner, that is, express oneself verbally in a clear way. Grice is probably best known for presenting an idea of 'conversational implicature' in terms of this theory. For example, let us suppose that A informs B, "I'm cold," and B replies, "Here is a blanket." B has conversationally implicated that if A takes the blanket, A is no longer going to be cold.

Grice is also regarded as the father of 'intention-based semantics,' in which the phrase 'timeless meaning' (i.e., conventional meaning) is of fundamental importance. As Gaukner explains, "That a certain form has a timeless meaning is normally necessary if a speaker is to reasonably expect that an utterance of that form of words will produce the intended effect" (2004). Grice's works helped establish pragmatics as the study of meaning embedded within its context. His impact is felt in many branches of contemporary linguistics, including the study of communicational grammars of discourses, conversational analysis, and even axiology.

Grierson, George Abraham, Sir (1851–1941)

J C Wright, SOAS, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Sir George Abraham Grierson was the originator and compiler of the monumental *Linguistic survey of India* (Grierson, 1903–1927). Completed in his 77th year, the *Survey* had been proposed to him as a work for life by Professor Robert Atkinson who, at Trinity College, Dublin, first developed in Grierson an interest in linguistics.

Grierson was born on January 7, 1851, at Glanageary, County Dublin. For 23 years, while an active member of the Indian Civil Service, he produced a vast series of publications bearing on the languages and orally transmitted literatures of North India, notably the Bihar dialects, the Hindi of Oudh and Braj, Kashmiri, and Gypsy Romani. His exemplary *Bihar peasant life* (Grierson, 1885) constitutes a linguistic-geographical study of vocabulary in which the implements and procedures of an agricultural province are described and illustrated. He compiled the first extensive bio-bibliography of literature in the modern Indo-Aryan vernaculars, and conspectus accounts of their distribution and affinities.

Grierson's *Linguistic survey of India* was presented to the government of India as intended to enable British administrators to communicate directly with the local populace, but it was devised rather with a view to revealing the richness of modern India's vernacular cultures to a West hitherto mesmerized by India's past. In 1898, after protracted negotiations, Grierson was permitted to reside and work in Camberley, Surrey, where he was assisted for a time by the Norwegian Sten Konow, who contributed much of the material relating to non–Indo-Aryan languages.

In its necessarily curtailed form, the *Survey* ensured that, for every patois that could be identified, one specimen of original narrative and the translation of one standard text would be collected, along with a list of words and test sentences. The provinces of Madras and Burma and the states of Hyderabad and Mysore declined to participate. As a result, only 179 of the 188 languages currently censused could be covered, together with 544 identified 'dialects.' Some 250 gramophone records illustrate forms of speech c. 1920. The inherent problems would have been insurmountable but for the fact that so well-qualified a philologist and linguist was able, as a civil servant, to divert to the task some of the administrative resources of the Imperial Government and its allies. For all its inevitable faults in detail, traceable usually to the effect of political geography in predetermining linguistic groupings, Grierson's classification remains adequate for practical purposes (notably the subsequent censuses of India and R. L. Turner's *Comparative dictionary of the Indo-Aryan languages*, 1966–1985) and a reference point for all research involving the languages of the subcontinent – Mon-Khmer, Tai, Tibeto-Burman, Munda, Dravidian, and Iranian, as well as Indo-Aryan. Materials for a subsequent *Ethnographical and linguistic survey of Burma*, compiled by L. F. Taylor, were lost as a consequence of the Japanese invasion of Burma.

After completing the *Survey* in 1927, Grierson went on publishing specimens of Indo-Aryan literatures well into his 80s. He died on March 9, 1941.

lexicon instead of the evolution of its grammatical structure. This he had done abundantly in his *Deutsche Grammatik*, of which the second edition (1822) of Part I (unlike the 1819 edition, which was devoted to morphology) constitutes an entirely new book, almost exclusively devoted to phonology ('Von den Buchstaben,' 1822: 1–595). This area is particularly suitable for historical research, since sound changes are the most obvious features of language evolution. Yet it was no longer the area of vocalism in Germanic (the causes and mechanisms of i-umlaut and similar changes had been recognized even before the completion of the 1819 edition) but the realm of particular series of consonants, in particular the evolution of the obstruents in Germanic, which had received his special attention. In the course of his research Grimm not only provided a general framework demonstrating the systematic nature of the shift of these consonants, which set them apart from the rest of the Indo–European language family, but also established another regular *Lautverschiebung*, which he saw as forming an integral part of the former. This was the shift of the Germanic voiceless stops to corresponding affricates or (double) fricatives in the High German dialects. These consonant shifts, which Grimm saw as forming a circle, were referred to by the later 1830s as 'Grimm's Law,' both in Germany and Britain. (The term was not first introduced by Max Müller as is frequently stated in the literature.)

Although Grimm (1822: 590) conceded that the "sound shift takes place in a general way, but never fully perfectly in details," his findings contributed to the establishment of the historical component of comparative philology in a way no other pre-1875 discovery did. In addition it was the second edition of his *Deutsche Grammatik* that established the importance of phonology in historical linguistics, an area largely ignored by Bopp, but pursued vigorously by Bopp's pupil August Friedrich Pott (*see* **Pott, August Friedrich (1802–1887)**) in his *Etymologische Forschungen* (1833–1836) and, a generation later, by the most important mid-19th-century linguist, August Schleicher (*see* **Schleicher, August (1821–1868)**), in his *Compendium der vergleichenden Grammatik* (1861–1862).

A few months after the dismissal of Jacob and Wilhelm Grimm from their professorships in Göttingen in 1837, the Berlin publishers Karl August Reimer and Salomon Hirzel, owner of the Weidmannsche Buchhandlung, in an effort to find suitable employment for these two illustrious scholars, proposed the compilation of a major dictionary of the German language. The project was intended to supplant previous works in the field, and given the historical approach Grimm had been advocating and practicing since 1816, it was clear that the lexicographical undertaking was to include all words in the German language that had existed since its earliest times, even if they had fallen into disuse. The organizational and logistical problems were tremendous (see Kirkness, 1980 for details). Work on the *Deutsches Wörterbuch* occupied the brothers Grimm until the end of their lives. In 1840 both accepted calls to the University of Berlin; the concluding volume appeared 100 years after their death, in 1960.

It is impossible to assess Grimm's scholarly accomplishments in one short article, even if attention is restricted solely to his linguistic work, which was just one among many of the fields to which he made lasting contributions. Although the importance of the work of such scholars as Adelung, Vater, Bernhardi, and others (to whom Grimm was indebted in many ways) should not be underestimated, it remains a fact that it was only from the early 19th century onwards, and with Rask, Bopp, Grimm, and a few others, that linguistic studies were developed into a recognized and organized profession. The importance and novelty of the approach was recognized by Grimm's contemporaries; his work became paradigmatic in many areas of German and Germanic studies. Although he argued in favor of retaining traditional Latin grammatical terminology, to him is owed a variety of terms, such as *Umlaut*, *Ablaut*, *Anlaut*, *Inlaut*, and *Auslaut* as well as (the not so successful) *Rückumlaut*, and, of course, 'strong' and 'weak' declensions, to which may be added *Brechung* ('breaking'), a phenomenon he was the first to describe.

Gross, Maurice (1934–2001)

M Piot, University of Grenoble, Grenoble, France

© 2006 Elsevier Ltd. All rights reserved.

Maurice Gross, a leading French linguist, born in Sedan (France), on July 21, 1934, was educated in mathematics in the École Polytechnique in Paris (1955). He soon joined (1960–1964), as a translator computer scientist, the Computing Agency of the Army Laboratory dedicated to Machine Translation (French, English, German, Russian) in partnership with the CNRS. In 1961, he moved to Harvard and MIT as a UNESCO scholarship holder, where he met Chomsky and other American linguists. Going back to Paris, he joined the Blaise-Pascal Computing Laboratory, where he worked on formal grammars in association with Marcel-Paul Schützenberger. In 1966, he obtained his Ph.D. (with a comparison between French and English substantival clauses) at the University of Pennsylvania with Zellig Harris. He earned his Doctorat-ès-Lettres in 1969 from the Sorbonne for his theses *Lexique des constructions complétives*. He began as a linguistics professor (after a year as associate professor in Aix-en-Provence) at the University of Paris in 1968, founding the Linguistics Department of Vincennes with Jean Dubois and Nicolas Ruwet. Later (1972), he joined the Linguistics Department of the University of Paris 7, until his untimely death. He remained all his life very close to Harris's grammatical approaches (he also translated Harris's syntactic lectures at the University of Paris-Vincennes, 1976).

In 1967, he founded the LADL (Laboratory of Linguistics and Automatic Documentation) as part of the CNRS, and he built, with his team, an exhaustive, empirically-based inventory of the 'lexicon-grammar' of French which, 30 years later, still remains the most complete syntax-based lexicon available. Long before computers could facilitate large-scale lexically-based language study, this syntactic dictionary allowed an automatic data processing: each lexical entry (for example, a verb) is associated with all its syntactic uses in sentences, i.e., the different clauses built with this item, and these properties are mentioned using '+' or '−'. After an extensive study of French verbs on his principles, he and his team built each 'lexicon-grammar' of predicative nouns, adjectives, adverbs and conjunctions. This syntactic research on French was followed by similar researches all over the world by researchers who have adopted the Gross model of description on their own language (such as Romance languages, Greek, standard German, English, Korean, Malagasy, Arabic Languages, Mandarin (Chinese), and so on), insofar as this model of description serves as a computational model for any language. His own published papers and books reach 200 items, some of them, including two books, yet unpublished. Until his last days, he always was thinking on the results of his grammatical description and other subjects, as these unpublished works testify.

Guadeloupe: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

Part of the Leeward Islands, Guadeloupe has been under uninterrupted French control since 1816, although French presence in the archipelago goes back to 1635. The French overseas department of Guadeloupe comprises six inhabited islands. Guadeloupe proper is in fact made up of two islands, Basse-Terre and Grand-Terre, which are divided by a narrow sea channel, and one of the Guadeloupian islands, Saint Martin, is shared with the Netherlands – the southern part of the island is known as Sint Maarten, and is part of the Netherlands Antilles. The official language of Guadeloupe is French and 90% of the 444 515 inhabitants are literate. A number of Lesser Antillean Creole French dialects are spoken by approximately 335 000 Guadeloupians: Guadeloupe Creole (Patwa, Patois, Kreyol), St. Martin Creole, Marie Galante Creole, and St. Barth Creole. There is also a dialect Virgin Island Creole English spoken in Guadeloupe known as St. Barth Creole English. The 18 radio and five television stations broadcast mainly in French, but also in Lesser Antillean Creole French.

Guam: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

Southernmost of the Mariana Islands, Guam is situated in the northern sector of the Pacific Ocean approximately 3300 miles west of Hawaii, 1500 miles east of the Philippines, and 1550 miles south of Japan. Ferdinand Magellan's visit of 1521 is the first recorded Western contact with the island. Guam was formally claimed by Spain in 1565, but following the Spanish-American War in 1898, it was ceded to the United States, who purchased it from Spain in 1899. During World War II, Guam fell under Japanese control for a 3-year period. Today, Guam is an organized, unincorporated territory of the United States that comes under the jurisdiction of the Office of Insular Affairs, a division of the Department of the Interior. The official languages on Guam are English and Chamorro, an Austronesian language that shows Spanish influence. Both are taught in school and appear in official documents. About 50% of the population communicates in Chamorro and about 80% of ethnic Chamorros have some command of the language. Chamorro is gaining in importance and it is taught at the University of Guam.

Guaraní

W F H Adelaar, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Guaraní (or *Avañe'ẽ*) is the name of a language spoken in parts of the South American lowlands, in particular in the basin of the Paraná and Paraguay rivers. It is one of the official languages of Paraguay, where it is the mother tongue of a majority of the population. The present number of speakers of Guaraní is estimated at 5 000 000. It survives as a minority language in neighboring areas of Argentina (Corrientes, Misiones) and Brazil (Mato Grosso do Sul, Paraná). In Bolivia, Guaraní (*guaraní boliviano*) is the name used for the closely related Chiriguano language. Originally an Amerindian language, Guaraní is now used by most layers of the Paraguayan population, regardless of their Indian or mixed background. They often speak a variety of Guaraní with a heavy Spanish admixture, called *jopará*. More conservative varieties of Guaraní are spoken by tribal groups such as the Chiripá (called Nhandéva in Brazil), the Mbyá and the Paĩ-Tavyterã (or Kaiová). The purity of the Guaraní literary language is watched over by writers and academic institutions.

The Guaraní language is part of a larger family, Tupi-Guaraní, which has a wide distribution in the South American lowlands. The latter also includes Tupinambá, the language that was used as a general language (*língua geral*) along the coasts of Brazil before the 19th century. Tupi-Guaraní, in its turn, is part of a larger stock named Tupí, which may be distantly related to the Cariban and Macro-Ge families. The original area of diffusion of both Tupi-Guaraní and its Tupí sister languages appears to be the Guaporé basin in southwestern Brazil (state of Rondônia). The expansion of the Tupi-Guaraní peoples may have occurred shortly before the European conquest. The strong position of Guaraní in Paraguay is related to the consequences of Jesuit missionary policy during the 17th and 18th centuries (*see* **Paraguay: Language Situation**). The first authoritative grammar of Guaraní was written by a Jesuit, Antonio Ruiz de Montoya (1640).

Modern Paraguayan Guaraní differs from the language described by Montoya in that it has lost some of its original morphophonemic complexity. Guaraní is a mildly polysynthetic language with a loosely structured morphology. It uses both prefixes and suffixes, the former being more tightly bound to the root than the latter. Guaraní prefixes indicate person (of subject, object, and possessor), mood (subjunctive, imperative), reflexive, reciprocal, accompaniment, and causative (except for transitive stems). There are two portmanteau prefixes that indicate the combination of a first person actor with a second person patient, e.g., *po-hecha* [pohe'ʧa] 'I see you (plural)' (*po-* '1st person actor with 2nd person plural patient'). Suffixes indicate case, diminutive, collective, causative (of transitive stems), future tense, mood (wish, intention, etc.), nominalization, subordination, and several other verbal categories. Some grammatical categories (aspect, number, most tenses) are indicated by elements that are best interpreted as separate words, as in *o-mba'apo hína* [õmbaʔa'po 'hĩnã] 'he is working' (*o-* '3rd person actor; *hína* 'progressive aspect'). Negation is usually indicated by a combination of a prefix and a suffix, as in *nd-o-hó-i* [ndo'hoj] 'he does not go' (*nd(a)-..-i(ri)* 'negation'; *o-ho* 'he goes'). Noun incorporation (both of subject and object) is frequent, especially in the colloquial language. Most incorporated nouns refer to body parts; e.g., *che-akã-rasy* [šẽãkãra'sï] 'I have a headache' (*che-* '1st person subject'; *akã* 'head'; *(-r)asy* 'hurt').

Like many other South American lowland languages, Guaraní features a so-called active/stative system. That is, transitive verbs are inherently active, but intransitive verbs can be classified either as active or as stative; compare active *a-guata* [aɣ^{w}a'ta] 'I walk' (*a-* '1st person singular actor') and stative *che-mandu'a* [šẽmãndu'a] 'I remember' (*che-* '1st person singular subject'). Adjectives (quality verbs) can be treated as a subclass of the stative verbs. Possessed nouns can also express the notion 'to have'; e.g., *che-róga* [še'roɣa] 'my house' (*che-* '1st person singular possessor,' *(-r)óga* 'house'), but also 'I have a house.' This makes it difficult to distinguish between stative verbs, on one hand, and expressions of possession, on the other.

Many nouns and stative verbs are subject to an alternation of their initial consonant (the most frequent set is *t-/r-/h-*) depending on the construction in which the form occurs; e.g., *téra* 'name,' *che-réra* 'my name,' *héra* 'his/her name.' Most prefixed forms take *-r-*; forms with initial *r-* also indicate the core of a genitive construction, in which the modifier precedes the modified; e.g., *yvága rape* [ï'vaɣa ra'pe] 'the road to heaven' (*yvaga* 'heaven,' *tape* 'road').

Grammatical relations, except subject and inanimate object, are indicated by case markers, postpositions, or combinations of both. Case markers tend to merge with pronouns or pronominal prefixes into special forms; for instance, *ha'e* [ha'ʔe] 'he, she, it' with ablative *-gui(ve)* [ɣ^{w}i'(ve)] is realized as *(i)chugui* [(i)šu'ɣ^{w}i]; with comitative *-ndi(ve)* [ndi'(ve)] as *hendive* [hẽndi've], etc.

Guaraní is widely known from the linguistic literature as an example of the existence of prosodic nasality or nasal harmony (a common feature in Amazonian languages). It has six oral and six nasal vowels. Prosodic nasality takes its source from a (stressed) nasal vowel or a nasal consonant and spreads leftward covering the root that contains the source as well as all its prefixes. Suffixes show a more independent behavior: they may adapt to the root or maintain their own nasality/orality structure. When nasality is generated by a nasal consonant (/m/, /n/, /ŋ/, /ŋ^{w}/) the latter marks the beginning of an oral domain, hence it is realized as half-nasal half-oral [mb, nd, ŋg, ŋg^{w}], e.g., in *marangatu* /maraŋa'tu/ [MÃŘÃŋga'tu] 'holy' (the nasal domain is indicated in small caps). Guaraní roots generally have final stress. When stress is penultimate, rightward nasal spread can occur as well. Some suffixes are affected by rightward spread, e.g., *kuña* + *-pe* → *kuña-me* /ku'jã-me/ [kũ'ñãmẽ] 'to the woman' (*-pe* 'dative').

Guatemala: Language Situation

N C England, University of Texas at Austin, Austin, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Twenty-four languages are spoken in Guatemala: Spanish, the Arawakan language Garífuna, the language isolate Xinka, and twenty-one Mayan languages. Approximately half of the population of Guatemala is indigenous, totaling over seven million people (estimates of the indigenous population range from 40% to 60%). Estimates of the number of speakers of indigenous languages in 2001 (Richards, 2003) give figures of a little over three million, or only 50–60% of the indigenous population at that time.

Garífuna (Carib, Black Carib, and Caribe) is the language of an Afro-Caribbean group (Garífuna) located in the port areas of Livingston and Puerto Barrios that is relatively small in Guatemala. Few of its members are speakers of Garífuna. The group has ties to the larger Garífuna population of Honduras and to Garífuna communities in Belize and Nicaragua. The Garífuna were latecomers to Guatemala, arriving in 1805 (Richards, 2003: 54). The Garífuna language is Arawakan (a very large South American language family), and it became the language of this Afro-Caribbean group after Africans, brought to the Caribbean by the slave trade and ship-wrecked, intermarried with Arawakan speakers on the island of Saint Vincent, British West Indies. They were expelled from Saint Vincent in 1797 (Campbell, 1997: 402) and became established in the coastal areas of Central America shortly thereafter.

Xinka (Xinca) is a moribund language in southeast Guatemala. It once consisted of four related languages, all but one of which are probably now extinct, and has no known other affiliations (Campbell, 1997: 166). Xinka pre-dated Mayan groups in the area and probably at one time had a larger extension, because toponyms from Xinka extend into El Salvador and Honduras. Xinka speakers likely also had a simpler technology than did the Mayas, because most Xinka terms for domesticated plants come from Mayan languages (Campbell, 1978). The remaining Xinka speakers are estimated to be fewer than ten.

Twenty-one Mayan languages are recognized by the Academia de las Lenguas Mayas de Guatemala. They belong to five of the six branches of the Mayan language family (see **Figure 1**) and are spoken by what some estimate to be the majority population of Guatemala. The language names and numbers of speakers are given in **Table 1** (population estimates for 2001 from Richards, 2003). The language names are spelled according to the norms established by the Academia de Lenguas Mayas de Guatemala; alternative spellings are given in parentheses (the

Figure 1 The Mayan language family (Kaufman, 1974: 85).

Ethnologue list of Mayan languages is notoriously inaccurate and will not be used here).

The exact number of Mayan languages spoken in Guatemala has been an issue of debate in recent years. In particular, the language Achi is linguistically a dialect of K'iche' but for sociolinguistic and political reasons is now considered to be a separate language, and the language Akateko until very recently was considered by its speakers to be Q'anjob'al. Discussions about the language/dialect status of several varieties of other languages are on-going. One current in that discussion is in favor of unification of language varieties to the extent possible; there have thus been proposals to consider Poqomam and Poqomchi' to be one language instead of two. At the same time, an opposite current promotes separation of languages as a marker of local identities. The most extreme case of proposed separation has been that of Chalchiteko, a dialect of Awakateko spoken by part of the population of the town of Aguacatán (the only town where Awakateko is spoken).

Language shift into Spanish is reducing the number of speakers of indigenous languages in Guatemala. Shift, in most instances, has been fairly recent (within the last 20 years), and Mayas themselves are not fully aware of the extent of the shift. Although the fact that children are not learning the language in many areas is self-evident, Mayas still tend to think of their communities as composed entirely of speakers of a Mayan language. The extent of shift into Spanish differs

Table 1 Mayan languages of Guatemala

Language	*Number of speakers*
Achi (Achí)	51 593
Akateko (Acateco)	5 572
Awakateko (Aguacateco)	16 272
Ch'orti' (Chortí)	9 105
Chuj	38 253
Ixil	69 137
Itzaj (Itzá)	123
Kaqchikel (Cakchiquel)	475 889
K'iche' (Quiché, K'ichee')	922 378
Mam	519 664
Mopan (Mopán)	468
Popti' (Jakalteko, Jacalteco)	38 350
Poqomam (Pocomam, Pokomam)	9 548
Poqomchi' (Pocomchí, Pokomchí)	69 716
Q'anjob'al (Kanjobal)	99 211
Q'eqchi' (Kekchí)	726 723
Sakapulteko (Sacapulteco)	3 940
Sipakapense (Sipacapense, Sipacapeño)	6 344
Tektiteko (Teko, Tectiteco)	1 241
Tz'utujil (Tzutujil, Tzutuhil)	47 669
Uspanteko (Uspanteco)	1 231

significantly for different regions and languages. In general, proximity to a major urban center or an international border increases the degree of language shift and loss, but local factors may speed up or retard the extent of the shift. Languages themselves range from moribund (Xinka) to highly endangered (Itzaj (Itzá), Mopan (Mopan), and Garífuna) to moderately or slightly endangered. Even the languages with the largest number of speakers include geographical areas that show advanced language loss (for instance, the city of Quetzaltenango in the K'iche' area). In spite of increased shift, a majority of the population in a majority of Mayan towns speaks a Mayan language.

Mayan languages have a series of plain voiceless stops and affricates matched by a series of glottalized stops and affricates, glottal stops, voiceless fricatives, and several voiced nasals, liquids, and glides. Most Mayan languages distinguish five long and five short vowels. Major word classes include nouns, transitive verbs, intransitive verbs (quite small; fewer than 50 roots), positionals (very large; 400–600 roots), adjectives (small; fewer than 50 roots), 'affect words' (large; more than 400 roots), and adverbs. They have a moderate amount of inflectional (mostly prefixing) and derivational (mostly suffixing) morphology, are verb-initial (either VOA or VAO), show ergative cross-referencing of arguments on verbs, and have passive and antipassive voices as well as several other voices (agent focus and applicative) depending on the language. Stative predicates are nonverbal.

Guatemalan Spanish is spoken natively by the non-indigenous population (Ladinos) and as a second language, and increasingly, a native language by part of the indigenous population. It is a distinct dialect of Spanish. It is characterized, among other things, by a phonology that is distinctly non-Caribbean (no *s* dropping and slower rate of enunciation); characteristic vocabulary, some of which is shared with Mexico or other countries in Central America; the use of a partitive or pleonastic possessive ("*tengo una mi camisa que me gusta mucho/I have a shirt that I like a lot*"); and the use of the *vos* pronoun and verbal forms for the marked second person singular, while *usted* is used for the unmarked second person singular. Spanish is the official language of Guatemala and the language for most official functions of the government, although bilingual education has brought the use of indigenous languages into the schools (starting about 20 years ago) and provision for the use of legal interpreters is currently beginning to be made.

Guillaume, Gustave (1883–1960)

J Hewson, Memorial University of Newfoundland, St. John's, NF, Canada

© 2006 Elsevier Ltd. All rights reserved.

Gustave Guillaume was born December 16, 1883. His early education remains obscure, but in 1914 he became a student of Antoine Meillet (1866–1936; *see* **Meillit, Antoine (Paul Jules) (1866–1936)**) at the Ecole des Hautes Etudes in Paris, at Meillet's invitation. In 1919 he published *Le problème de l'article et sa solution dans la langue française* (awarded the Prix Volney), the first extensive examination of article function; articles are actualizers, which when added to an underlying noun, or noun in tongue (i.e., *langue*), creates a surface noun phrase, or noun in discourse (discourse replaces Saussure's term 'parole'; *see also* **Saussure, Ferdinand (-Mongin) de (1857–1913)**; **Saussurean Tradition in 20th-Century Linguistics**).

In 1929 he published *Temps et verbe. Théorie des aspects, des modes et des temps*, in which he presented verbal systems as cognitive systems having successive developmental stages, which can be detected by complexity of form and surface usage. Language is no longer seen as static, but as an activity, the creation of discourse. In 1931 he became vice-president of the Société Linguistique de Paris, and in 1934 its president.

Subsequent to the death of Meillet, he was appointed lecturer at the Ecole des Hautes Etudes in 1938, and taught there until his death in February, 1960. The classes had a regular clientele, some of whom attended year after year. During these 22 years, he further developed the view that a language is a cognitive structure, in which content is primary, and morphosyntax, since its only role is to make the content perceivable, is secondary. His Law of Coherence states that a content system (e.g., nominal number) is fully coherent, so that irregular plurals (e.g., mice, teeth) are just as regular in their cognitive content as other plurals. His Law of Simple Sufficiency states that the morphosyntax easily tolerates irregularity; it only has to be regular enough to reflect sufficiently the coherence of the content system that it marks. He also developed his views on the act of language, the cognitive activity of the speaker in creating discourse, a study to which he gave the name of 'psychomechanics,' since it deals with mental mechanisms.

In his last years he published one book and some 20 articles, gathered into a posthumous volume (1964). In his last decades his ideas began to be disseminated by others, notably Moignet, Stefanini, Molho, in France, and Roch Valin in Canada. On his death he left his papers, including the draft text of every lecture given during the 22 years at the Hautes Etudes, to Valin, who subsequently founded the Fonds Gustave Guillaume at Laval University in Quebec City as a research center in psychomechanics. By 2000, 16 volumes of the lectures had undergone joint publication in Canada and in France, with another 19 still to come. A volume of important excerpts has also appeared (1973); it was translated into English (1984), and then into half a dozen other languages. In 2003 an important manuscript that he had completed just before his death was published: *Prolégomènes à la linguistique structurale 1. Essais et mémoires de Gustave Guillaume*, a profound and coherent presentation of his linguistic thought, with a second volume in 2004, which also contains notes for two further volumes that he had planned. There are further volumes to come, and the fact that the value of these is undiminished after almost fifty years is an indication that Guillaume was a most original penetrating thinker, as recognized by his faithful audience at the Hautes Etudes (many of whom had distinguished careers of their own).

Language Endangerment and State of Documentation

Several Guinean languages or varieties of languages are in danger of extinction. Language endangerment in the multilingual context of Guinea is mostly due to language shift to contact languages with higher prestige or weight. In the south of the country, however, in areas adjacent to Sierra Leone and Liberia, prolonged civil wars leading to the killing or relocation of parts of the population contribute as external factors to language death. The most threatened languages are spoken on the coast, where they are in contact with Soso, which spreads rapidly. Thus, some varieties of the Atlantic language Baga are already extinct, and others immediately endangered. The Atlantic languages Mmani, Nalu, and Landoma are also being replaced by Soso. In the Fuuta Jalon area, Pulaar is eliminating the Jalonke variety of Yalunka as well as the Atlantic languages Basari and Konyagi and pockets of other Mande languages. Toward the Malian border, varieties of Maninka attract speakers to the detriment of other languages. All the endangered languages of Guinea are not well described or altogether undescribed; in the cases of Mmani and Jalonke, a documentation and description is under way. For at least one variety of each of the major languages of Guinea, a grammatical description exists – although often with a limited scope. Even for these languages, more comprehensive descriptions are not available, however, and the documentation of corpora of primary data is practically nonexistent to date.

Guinea-Bissau: Language Situation

J Lingna Nafafe, University of Birmingham, Birmingham, UK

© 2006 Elsevier Ltd. All rights reserved.

Guinea-Bissau has more than 23 major spoken languages and are presented here in their importance in terms of speakers, Creole, Balanta, Fula, Manjaco (Mandjak), Mandinga (Mandinka), Papel, Beafada (Biafada), Mancanha (Mankanha), Bijaco, Felupe (Ejamat), Portuguese, Mansonca, Banhum, Nalus (Nalu), Soninke, Pajadinka (Badjara), Baiote (Bayot), Cassanca, Cobiana (Kobiana), Bassari (Basari), Sarakule, Suso (Susu), Djacanca, Cassamacunda; though some authorities say there are as many as 31 different languages in the country. Among these, however, only four of them are written languages with agreed alphabets – Balanta, Bijaco, Creole, and Papel – each of which has a limited number of available literatures in the form of short stories, poems, and the Christian Bible (the New Testament) (Augel, 1996). The aim of this article is to review critically one of these written languages, Creole, by examining its meaning, etymology, and structure according to linguistic theory, and to review its use as the national language of Guinea-Bissau.

The term *creole* in the archaic Portuguese (Crioulo/Criolo) from 1632 to 1643 signified a mixed-race

person, as well as a male Negro born in Brazil. The term also stood for 'a white man or woman originating from the colonies, and in 1873, the slave who is born in the house of the master' (Corominas, 1934 and Vieira as quoted in Valkhoff, 1966). It was not, however, until the end of the 17th century that the term *creole* was used in writing to signify a language, which is a usage found, for example, in Coelho's work on Guinea-Bissau (1684); though it was still possible that the term may have existed long before it came to be written down in the seventeenth century.

Etymologically, the word *Creole* derives from the Latin *creare,* meaning 'to beget' or 'create'. The term it came to infer a language born out of the interaction between the Portuguese mercantile settlers who resided among the natives in Guinea-Bissau soon after the first contact in 1446 (Lingna Nafafé, 2001). It was in some of the old commercial towns and market centers in Guinea-Bissau, such as São Domingos, Cacheu, São Filipe, and Geba, that Creole emerged among these settlers. There are those, however, who espouse the view that Creole as a language originated in Cape Verde and was later taken into the mainland of Guinea-Bissau by the Cape Verdean merchants (Lobba and Mendy, 1994).

Other theories have also been proposed (Couto, 1992). Among them are five significant hypotheses. (1) The *monogenetic hypothesis* suggests that the Creole language had its origin as a pidgin of Portuguese (Valkhoff, 1966; Schuchardt, 1980; Bollée, 1977; Maurer, 1987; Perl, 1990). (2) There is the *continental hypothesis* that says Creole originated in mainland Guinea-Bisau and was subsequently taken to the Cape Verde; thus the Africans taken from Guinea-Bissau brought with them the Creole language (Barros, 1897 and 1899; Bull, 1989). (3) There is also the opposite view, an *insular hypothesis,* that states the Creole language originated in the Cape Verde and was then taken by Cape-Verdeans to Guinea-Bissau (Nolasco da Silva, 1970; Carreira, 1972; Quintino, 1964). (4) The *ambiguous hypothesis* suggests that Creole came about simultaneously from Cape Verde and Guinea-Bissau (Rougé, 1986). (5) There is a hypothesis based on *knowledge of the language* that states that pidgin, which became the base for Creole, originated in Portugal when interpreters who had been kidnapped from Guinea-Bissau exchanged their knowledge of the language, and thereafter Creole was taken to Africa (Zurara, 1949; Naro, 1978).

Today, Creole is the lingua franca in Guinea-Bissau, spoken by 60% of the population. Guinea-Bissau Creole as a language has a definite grammatical structure, syntax, and phonetics that are much closer to Guinea-Bissau languages. It borrows vocabulary extensively from Portuguese and its African counterpart (Barros, 1897 and 1899; Bull, 1989). However, although Creole is widely spoken by the majority of the people in the country, it is not yet being used as the language of education (Massa, 1996). This prospect has been hampered by political motives that emerged from the liberation movement of the 1960s (Cabral, 1974).

Cabral's contention was that Creole was based on the use of Portuguese as a language of scientific enquiry as opposed to the Balanta or Mancanha languages (Cabral, 1974). Cabral was one of the founders and a leader of PAIGC – the national party of Guinea-Bissau, which fought for national independence from Portugal. According to him, the colonizers' language could be regarded as a useful tool for the development of Guinea-Bissau society. He stated that 'Portuguese [language] is one of the best things that the whites [Europeans] have left us with . . . [it] can express concrete truths, relatives, for example, in science. For instance, we say that the Moon is a natural satellite of the Earth. Try saying 'natural satellite' in Balanta or in Mancanha!' (Cabral, 1974). It must be remembered that Cabral was writing at the time of the resistance movement, whose general sentiment was to reject what was viewed as imperialist, hence, colonialist. The cry of re-Africanization was a cry to return to Guinea-Bissau roots, that is, to Guinean culture. (Lingna Nafafé, 2001). Even so, if such borrowing is possible and acceptable, as Cabral proposed, it follows that the word *satellite* can be used in Balanta or Mancanha, for it is a Latin word that has already found its way into the Portuguese language.

Inside the country there has not been a clear discontinuity with Cabral's rationale. This has to be explained on the basis of the socio-political milieu of the minority elite in power who still regard the Portuguese language as a carrier of knowledge, even though it is only spoken by a minority of Guinea-Bissau's population. The debate on the importance of the Portuguese language in the country continues. However, it is not likely that Creole will soon threaten Portuguese as the language of formal education and the official language of Guinea-Bissau.

Gujarātī belongs to the southwestern family of Modern/New Indo-Aryan, a subgroup of the Indo-Iranian branch of Indo-European languages. The official language of Gujarat state, it is spoken across South Asia in Maharashtra (especially Bombay), Rajasthan, Sind, lower Punjab, Madhya Pradesh, and in Karnataka and among the Parsi, Hindu, Muslim, and Jain diaspora in the Persian Gulf, East and South Africa, Britain, North America, and Australia. There were approximately 45 479 000 speakers reported in 1997 (*Indian Missions Abroad*).

History and Literature

Scholars historically distinguish Old Gujarātī (12th–15th centuries); Middle Gujarātī (15th–18th centuries); and Modern Gujarātī (18th century onward). Its antecedents are traceable to a distinct Old Western Rajasthānī literary form, despite the attestation of Jain Prākrit treatises and studies by Middle Indian grammarians of *Nāgara Apabhraṁśa*, a literary *Apabhraṁśa* of Gujarat. The 12th-century *Bharateśvarabāhubalirāsa* (1185) is the earliest work written in Gujarātī. Prose and verse compilations written from the 13th century onward exist and include the seasonal poem *Vasantavilāsa* and the 14th-century commentary, the *Ṣaḍāvaśyakabālabodhavṛtti*. Narasiṃ ha Mehtā's (c. 1414–1480) devotional ballads marked a new era in poetry, acquiring pride of place in its literary annals. The Gujarātī daily, *Mumbai Samācār* (established in 1822), is one of the oldest newspapers in Asia. Bombay Parsis were pioneers in Gujarātī and Urdū theater from the 1850s.

Dialects

Gujarātī spoken along the Baroda-Ahmedabad corridor is regarded as the standard/prestige dialect. (Whether the register of Nāgarī Brāhmaṇs carries

Guinea: Language Situation

F Lüpke, School of Oriental and African Studies, London, UK

© 2006 Elsevier Ltd.. All rights reserved.

Overview and Major Languages

The republic of Guinea with its capital Conakry is located on the Atlantic coast of West Africa and has approximately 8 000 000 inhabitants. According to the Ethnologue (2004), 33 languages, including the official language French and Guinean Sign Language, are used in the country. Information on numbers of speakers and on criteria for identifying languages is unreliable, however. The colonial language French is used in administration and formal schooling but is not understood by the vast majority of the population. Schooling rates and school life expectancy are extremely low, and the scope and success of adult literacy programs are restricted. Therefore, the number of Guineans with a limited competence in French and resulting literacy in the roman script is low and stagnating, with estimates ranging from 28 to 35% (Ethnologue, 2004) to 43% (UN Statistics Division, 2003). The indigenous languages of Guinea all belong to the Mande and Atlantic branches of the Niger-Congo language phylum and have lexically and grammatically influenced each other considerably due to language contact.

Major Languages

Three of the vernacular languages are used as regional *linguae francae* in Guinea and partly also in neighboring countries. These languages are the Pulaar (Fuuta Jalon) variety of Fula, with more than 2 million speakers, Maninka, with close to 2 million speakers, and Soso (Susu) with approximately 800 000 speakers in Guinea. Fula is a major African language distributed in a dialect continuum over the entire Sahel belt. The Guinean variety of Fula is mainly spoken in the Fuuta Jalon, a mountainous area in the north of the country, but also by speech communities in the capital. Maninka belongs to the Manding dialect cluster, which covers large parts of Mali, Eastern Senegal, and the north of Côte d'Ivoire and is spoken in Eastern Guinea. Soso is the only vehicular language that is almost exclusively present in Guinea. Soso is spoken on the coast, in and around the capital Conakry. None of the indigenous languages is currently used as a medium of formal education or in official contexts. The national language policy of introducing eight languages into primary education, Pulaar (Futa Jalon), Kankan Maninka, Soso (Susu), Kisi (Northern Kissi), Guinea Kpelle, Loma, Konyagi (Wamei), and Basari was discarded after the death of the first president after independence, Sékou Touré, in 1984. Attempts to develop indigenous languages by equipping them with orthographies based on the roman alphabet have largely failed, partly because of competing existing literacies using nonroman scripts. Once the language of the theocratic Islamic kingdom of the Fuuta Jalon, Pulaar has a longstanding written tradition using an adapted Arabic script, the so-called Ajami, which is still prestigious and thriving. Due to the location of most Guinean languages in the sphere of influence of Islam, Q'uranic schooling and resulting literacy in Arabic are widespread and of greater weight than formal schooling throughout the country, except for mainly Christian areas in the south. Apart from standardized writing traditions such as Pulaar Ajami, literacy in Arabic is also often informally exploited for the writing of other Guinean languages in Arabic letters. For Maninka, the indigenous script Nko is still marginally in use and competes with Arabic writing traditions.

Mande Languages

Fourteen, or about half of the languages attested in Guinea, are Mande languages. With the exception of Dan and Mano, which belong to the Eastern branch of Mande and are spoken mainly in Côte d'Ivoire, they are Western Mande languages. Most of the other Mande languages are also attested in surrounding countries, e.g., Kpelle and Koranko (Kuranko) in Sierra Leone or Jahanka in Mali. Although also spoken beyond the borders of Guinea, Maninka, Soso, and possibly also Yalunka have more speakers in Guinea than outside.

Atlantic Languages

Seventeen, or slightly more than half of Guinean languages, belong to the Atlantic branch of Niger-Congo. Languages of both the Northern and the Southern branch of Atlantic are attested. By far the most important Atlantic language of Guinea is the Fuuta Jalon variety of Fula, also called Pulaar, followed by Northern Kisi (Northern Kissi) in terms of numbers of speakers. Some Atlantic languages, such as the Baga languages and East Limba, are confined to Guinea. Other language areas stretch across the borders into neighboring countries, such as Basari into Senegal and Landoma into Guinea Bissau.

Language Endangerment and State of Documentation

Several Guinean languages or varieties of languages are in danger of extinction. Language endangerment in the multilingual context of Guinea is mostly due to language shift to contact languages with higher prestige or weight. In the south of the country, however, in areas adjacent to Sierra Leone and Liberia, prolonged civil wars leading to the killing or relocation of parts of the population contribute as external factors to language death. The most threatened languages are spoken on the coast, where they are in contact with Soso, which spreads rapidly. Thus, some varieties of the Atlantic language Baga are already extinct, and others immediately endangered. The Atlantic languages Mmani, Nalu, and Landoma are also being replaced by Soso. In the Fuuta Jalon area, Pulaar is eliminating the Jalonke variety of Yalunka as well as the Atlantic languages Basari and Konyagi and pockets of other Mande languages. Toward the Malian border, varieties of Maninka attract speakers to the detriment of other languages. All the endangered languages of Guinea are not well described or altogether undescribed; in the cases of Mmani and Jalonke, a documentation and description is under way. For at least one variety of each of the major languages of Guinea, a grammatical description exists – although often with a limited scope. Even for these languages, more comprehensive descriptions are not available, however, and the documentation of corpora of primary data is practically nonexistent to date.

Guinea-Bissau: Language Situation

J Lingna Nafafe, University of Birmingham, Birmingham, UK

© 2006 Elsevier Ltd. All rights reserved.

Guinea-Bissau has more than 23 major spoken languages and are presented here in their importance in terms of speakers, Creole, Balanta, Fula, Manjaco (Mandjak), Mandinga (Mandinka), Papel, Beafada (Biafada), Mancanha (Mankanha), Bijaco, Felupe (Ejamat), Portuguese, Mansonca, Banhum, Nalus (Nalu), Soninke, Pajadinka (Badjara), Baiote (Bayot), Cassanca, Cobiana (Kobiana), Bassari (Basari), Sarakule, Suso (Susu), Djacanca, Cassamacunda; though some authorities say there are as many as 31 different languages in the country. Among these, however, only four of them are written languages with agreed alphabets – Balanta, Bijaco, Creole, and Papel – each of which has a limited number of available literatures in the form of short stories, poems, and the Christian Bible (the New Testament) (Augel, 1996). The aim of this article is to review critically one of these written languages, Creole, by examining its meaning, etymology, and structure according to linguistic theory, and to review its use as the national language of Guinea-Bissau.

The term *creole* in the archaic Portuguese (Crioulo/Criolo) from 1632 to 1643 signified a mixed-race

Gujarati

B K Waghmar, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Gujarātī belongs to the southwestern family of Modern/New Indo-Aryan, a subgroup of the Indo-Iranian branch of Indo-European languages. The official language of Gujarat state, it is spoken across South Asia in Maharashtra (especially Bombay), Rajasthan, Sind, lower Punjab, Madhya Pradesh, and in Karnataka and among the Parsi, Hindu, Muslim, and Jain diaspora in the Persian Gulf, East and South Africa, Britain, North America, and Australia. There were approximately 45 479 000 speakers reported in 1997 (*Indian Missions Abroad*).

History and Literature

Scholars historically distinguish Old Gujarātī (12th–15th centuries); Middle Gujarātī (15th–18th centuries); and Modern Gujarātī (18th century onward). Its antecedents are traceable to a distinct Old Western Rajasthānī literary form, despite the attestation of Jain Prākrit treatises and studies by Middle Indian grammarians of *Nāgara Apabhraṁśa*, a literary *Apabhraṁśa* of Gujarat. The 12th-century *Bharateśvarabāhubalirāsa* (1185) is the earliest work written in Gujarātī. Prose and verse compilations written from the 13th century onward exist and include the seasonal poem *Vasantavilāsa* and the 14th-century commentary, the *Ṣaḍāvaśyakabālabodhavṛtti*. Narasiṃ ha Mehtā's (c. 1414–1480) devotional ballads marked a new era in poetry, acquiring pride of place in its literary annals. The Gujarātī daily, *Mumbai Samācār* (established in 1822), is one of the oldest newspapers in Asia. Bombay Parsis were pioneers in Gujarātī and Urdū theater from the 1850s.

Dialects

Gujarātī spoken along the Baroda-Ahmedabad corridor is regarded as the standard/prestige dialect. (Whether the register of Nāgarī Brāhmaṇs carries

'RP' status remains debatable). Other dialects are Suratī (southern Gujarat), Carotarī (Charotari; central Gujarat), Kāthiāwārī (Saurashtra), and Pāṭānī (northern Gujarat). Pakistani Gujarātī is probably a Pāṭānī subdialect, and code switching is waning as the younger generation shifts to Urdū and provincial languages. Muslim speakers there and elsewhere obviously adopt Perso-Arabic lexicons – its largest word stock after Sanskrit – especially in religio-cultural discourse. Parsi Gujarātī, an ethnolect of the subcontinent's Zoroastrians is, however, readily intelligible. East African Gujarātī now contains Swahili loanwords. Kacchī (Kachchi) is semantically intermediate between Gujarātī and Sindhī and is also influenced by Mārwārī.

Grammar

Phonetically, Gujarātī is unique for murmured vowels developed from final /h/ and two open vowels, /ɛ/ and /ɔ/. An absence of contrast exists between short and long /*i*/ and /*u*/ vowels. Variable or invariable substantives and adjectives, as well as pronominals, have three genders (including the neuter) and two numbers; they inflect for direct and oblique forms, the latter with post-positions and clitics. Verbal forms have temporal, modal, and aspectual contrasts. Combinations of verbal nouns and adjectives with auxiliaries produce an elaborate variety of obligational and desiderative forms, and the vocabulary is rich in passive, causative, and double causative verbs (Cardona, 1965). Vector/compound verbs, a common New Indo-Aryan feature, are employed in restricted contexts with specific semantics.

Orthography

A manuscript dated 1592 (Mistry, 1996) attests that an alphasyllabic script derived from a Devanāgarī variant has been employed for writing Gujarātī and Kacchī since the 16th century. A cursive style replaced the standard Sanskrit script used in prose and verse when printing began during the 1830s. Independent and conjunct forms are expressed by 45 symbols: 8 vowels, 34 consonants, *anusvāra*, *visarga,* and a velar nasal grapheme. Written from left to right, Gujarātī is conspicuous for its absence of head strokes and varying phonemic modifications. As in other Brāhmī-derived scripts, the post-consonantal /*a*/ is evidently assumed in a consonant lacking diacritics. Devanāgarī-derived numerals were adopted with modified shapes for the digits 3, 5, 6, and 9.

Gullah

T Hopkins, Florida International University, Miami, FL, USA

© 2006 Elsevier Ltd. All rights reserved.

Gullah is the name of the language spoken by the former African slaves and their descendants (also called Gullahs) living along the southeastern U.S. Atlantic coastline from the northern tip of North Carolina to Jacksonville, Florida, especially in the Sea Islands off the coast of South Carolina and Georgia and the bordering mainland areas (e.g., the low country). The Gullah language and its speakers are also respectively known as Geechee and Geechee(s), a local in-group term, and because of its negative connotation it is not used by outsiders. Other contemporary terms used to refer to the Gullah language and its speakers have included Sea Island Creole and Sea Islanders, but these terms have largely been restricted to the academic literature. Another more recent term that has sometimes been used to identify the Gullahs is Native Islanders, employed largely on Hilton Head Island to distinguish the native Gullah Sea Islanders from the influx of outsiders that began settling on the sea islands in the 1950s. However, this term has not received widespread acceptance among the Gullah population and Gullah still seems to be the preferred ethnic classification for the language and its speakers. Gullah has historical and linguistic links with Afro–Seminole, an offshoot of Gullah spoken by black Seminoles and their descendants, who were forced out of northern Florida to the west in the 1830s, and are now living in central Oklahoma, western Texas, and northern Mexico. The exact number of Gullah speakers today is uncertain because no census has attempted to distinguish the Gullahs from other African Americans living in the region.

History

The Gullahs are descendants of Africans brought from the Caribbean and directly from West Africa to provide the slave labor force for a plantation agricultural system, supported by English planters who began settling in the low country region in the late 1600s. The low country's rich fertile soil was ideal for the prosperous production of such plantation crops as rice, indigo, and the long-stapled Sea Island cotton for which the Sea Islands became known. The success of the plantation system was owed not only to the slave labor force but also to the agricultural and technical skills of the Africans, particularly in rice cultivation. Following the U.S. Civil War in 1865, the English planters abandoned their plantations, leaving the freed Africans and their descendants to eke out a living of their own. They engaged in small-scale farming, hunting, and fishing, and the relative isolation of the Sea Islands allowed them to preserve many of the traditions and customs of their African ancestors. Today, fish netting, basket weaving, woodcarvings, and quilting are some of the customs that characterize the rich cultural lifestyle of the Gullah people.

The etymology of the term Gullah has not yet been determined. Gullah may have derived from Ngola, the name of an African tribe in the Hamba basin of Angola, a West African region from which many of the Africans were transported, or it may have originated from Gola, the name of an African tribe and language near the Liberia-Sierra Leone border in West Africa. The etymology of Geechee is also unknown. Geechee may have derived from the Ogeechee River plantation in Georgia, the word gidzi in Mende to mean a country called Kissy (Liberia), or it may have come from the name of a tribe and language in Liberia. Equally obscure is how or when Gullah became the local ethnic classification for the enslaved Africans and their descendants living in the low country and their language. Historical citations show its first appearance in the literature in 1822, when the Charleston City Council records made reference to Gullah Jack and his company of Gullah or Angola Negroes. This indicates that its early use was associated with a particular group of Africans. However, the Gullah people and their language are far more diverse as both their historical development and language reveal.

Language Development

Gullah is the only English-based creole in the United States, although its origins are still speculative. Three hypotheses have been proposed of its development. One hypothesis suggests that Gullah developed from the Caribbean English spoken by the Africans and their descendants on plantations in the Caribbean and was brought with the African slaves when transported to the low country and subsequently learned and linguistically influenced by the Africans who were later imported into the region. Another hypothesis is that Gullah originated in a pidgin that developed on the West African coast and was brought with Africans imported to the low country. A third hypothesis suggests that Gullah developed on the plantations in the low country out of contact between English-speaking settlers and the various West African languages of the African slaves. Whatever the source, the retention of Africanisms in all components of the Gullah grammar is a common thread, and it is largely

these features, commonly associated with an African substratum, that is often used to distinguish Gullah from its English lexifier source.

Linguistic Characteristics

Gullah differs from General American English most obviously in its phonology. Some of these features include the use of the voiced bilabial fricative [**β**] or the voiced labiodental frictionless continuant [**ʋ**] for the voiced labiodental fricative [**v**] in English, e.g., [βɛri] cf. 'very,' [səʋænə] cf. 'Savannah'; the use of the voiced palatal nasal [**ɲ**] in, e.g., [ɲustə] cf. 'used to'; and the absence of interdental fricatives in, e.g., [tɪn] cf. 'thin' and [di] cf. 'the.' The prenasalized and labiovelar stops [**kp/gb**] were reported in early Gullah phonology but these sounds were largely used in the Africanisms, and although Africanisms are still present in the Gullah lexicon, they do not appear to be in widespread use among the Gullah today.

The Gullah lexicon is largely English. From his research conducted in the late 1930s, Lorenzo Turner was the first linguist to document over 4000 Africanisms in the Gullah lexicon, many of them used as basket names (e.g., Gullah nicknames). Today you can still hear in normal everyday conversations such African retentions as *buckra* 'white man,' *tita* 'elder sister,' *dada* 'mother or elder sister,' *nyam* 'eat/meat,' *sa* 'quickly,' *benne* 'sesame,' *una* 'you,' and *da* the verb 'to be.' Other Gullah Africanisms such as *cooter* 'turtle,' *tote* 'to carry,' *okra* 'plant food,' *gumbo* 'stew,' and *goober* 'peanut' are widely used in mainstream American English. In addition to direct loans, the Gullahs also employ a large number of calques, e.g., *day clean* 'dawn,' *day broad clean* 'full daylight,' *first dark* 'sunset,' *night shut-in* 'midnight,' *sweet mouth* 'flattery,' *bad mouth* 'to denigrate,' *i foot broke* 'to become pregnant,' *big eye* 'greedy,' and *hard head* 'dumb.'

Its most interesting features morphosyntactically include the pronominal form **unə** 'you' (2nd person sg/pl); nə 'and' (conj); də 'the verb be'; bɪn 'was'; sɛ/fə 'that' (complementizer); dɛm to refer to '& company' when postposed to proper animate nouns as in Suzi dem 'Susie and others' and 'those' as a demonstrative determiner to common nouns as in dem boy 'those boys.' Like its English lexifier creoles, Gullah also employs several preverbal auxiliaries within its tense, aspect and modal verbal paradigm. The primary auxiliaries are *də, ə, bɪn, don, dəz,* and *go,* which can occur alone or in combination with each other to express a wide range of tense, modal, and aspect meanings in past/nonpast contexts. These same forms function as lexical verbs. As an auxiliary [*də*] in *I də go* generally indicate durative and habitual meanings cf. 'I am/was going' and 'I generally go,' respectively. Habitual meaning is also expressed with the auxiliary [*d*ʌz]; the auxiliary [*də*] can also express iterative and perfective meanings. Its phonological variant [*ə*] indicates durative, habitual, iterative, and perfective meanings. The auxiliary [*don*] expresses perfective meaning in *I don go* cf. 'I have gone'; the auxiliary [*bɪn*] in, e.g., *I bɪn go* indicates anterior meaning cf. 'I went/had gone'; the auxiliary [*go*], as well as auxiliary [*ə*], expresses future meaning as in *I go go* or *I ə go* cf. 'I will/would go.' Gullah is not homogeneous, so the use of these grammatical forms and meanings may vary depending on the region (e.g., the sea island or mainland area the Gullah speaker originated) and sociocultural factors (e.g., age, education, socioeconomic status, etc.).

In the mid-1950s, developers launched the Sea Islands on an explosive growth in development and population called progress, which led to an unprecedented assault on the relatively stable Gullah people and their way of life. The Sea Islands, which had until then been isolated, were now connected by causeways and bridges to the mainland (only two islands, Daufuskie Island, South Carolina, and Sapelo Island, Georgia, still remain unattached to the mainland but have not escaped development). The possible extinction of the Gullah population was threatened and local organizations, such as the Penn Center, the Gullah Coalition, and Gullah Festival, were inaugurated and are now contributing to the preservation of the Gullah language and cultural identity.

Gundert, Hermann (1814–1893)

K Karttunen, University of Helsinki, Helsinki, Finland

© 2006 Elsevier Ltd. All rights reserved.

Hermann Gundert, a German missionary and pioneer of Dravidian linguistics, was born as the son of a merchant and founder of the Württemberg Bibelanstalt. He was educated at Stuttgart Gymnasium and, from 1827, at Maulbronn Seminar. After studies of theology at Tübingen, he passed the theological exams and received a Ph.D. there in 1835. He left immediately for India and started working at the British Mission in Tirunelveli under Karl Rhenius, who was also a Tamil scholar. After a brief time in Chittur, Tamil Nadu, he moved in 1838 to Basler Mission in Malabar (North Kerala). There he learned Malayalam, eventually to great perfection. He worked mainly in Tellicherry (now Talasseri). He was an eager educationalist and became Government's School Inspector for Malabar and Kanara in 1857. In 1859 an illness forced him to return to Germany, where he headed Calwer Verlag from 1860 onward. Gundert was one of the very first Western scholars to study the Malayalam language, and his grammar and dictionary remained for a long time the standard works in the field. The most important is the large dictionary, based on both extensive reading (with numerous text references) and wide experience of various forms of spoken language. He developed a special transcription to indicate the right pronunciation beyond the mechanical transliteration of the Malayalam script and strove to determine correct etymology for each work. In addition to the Bible translation (New Testament 1868, parts of the Old Testament) he also wrote a number of religious works in Malayalam. Many of his works appeared in the 1840s and 1850s in small lithographed editions in Mangalore and Talasseri. The biography of Hermann Mögling (1811–1881), his missionary friend and a noted Kannada scholar, appeared in 1882. His published diaries are an important source of his life and of 19th century South India.

Hermann Gundert, a German missionary and pioneer of Dravidian linguistics, was born as the son of a merchant and founder of the Württemberg Bibelanstalt. He was educated at Stuttgart Gymnasium and, from 1827, at Maulbronn Seminar. After studies of theology at Tübingen, he passed the theological exams and received a Ph.D. there in 1835. He left immediately for India and started working at the British Mission in Tirunelveli under Karl Rhenius, who was also a Tamil scholar. After a brief time in Chittur, Tamil Nadu, he moved in 1838 to Basler Mission in Malabar (North Kerala). There he learned Malayalam, eventually to great perfection. He worked mainly in Tellicherry (now Talasseri). He was an eager educationalist and became Government's School Inspector for Malabar and Kanara in 1857. In 1859 an illness forced him to return to Germany, where he headed Calwer Verlag from 1860 onward. Gundert was one of the very first Western scholars to study the Malayalam language, and his grammar and dictionary remained for a long time the standard works in the field. The most important is the large dictionary, based on both extensive reading (with numerous text references) and wide experience of various forms of spoken language. He developed a special transcription to indicate the right pronunciation beyond the mechanical transliteration of the Malayalam script and strove to determine correct etymology for each work. In addition to the Bible translation (New Testament 1868, parts of the Old Testament) he also wrote a number of religious works in Malayalam. Many of his works appeared in the 1840s and 1850s in small lithographed editions in Mangalore and Talasseri. The biography of Hermann Mögling (1811–1881), his missionary friend and a noted Kannada scholar, appeared in 1882. His published diaries are an important source of his life and of 19th century South India.

Gur Languages

J Bendor-Samuel, Summer Institute of Linguistics, High Wycombe, UK

© 2006 Elsevier Ltd. All rights reserved.

There are some 85 Gur languages within the Volta-Congo branch of the Niger-Congo family. These languages are used in an area that stretches from southeast Mali across the northern Ivory Coast, a large part of Burkina Faso, all of northern Ghana, northern Togo, northern Benin, and into northwest Nigeria. They predominate within the parallels 6°W and 2°E and 8°N and 14°N, the savannah lands north of the forest belt where the Kwa languages are spoken. The name 'voltaïque' is used in French.

The Speakers

The number of speakers of Gur languages is probably in the region of 12 to 15 million people. There is a wide range in the size of the Gur language groups; some are large, such as the Moore in eastern Burkina Faso numbering some four million; others are much smaller with only a few thousand speakers.

Gur Studies

The earliest record of Gur languages is found in S.W. Koelle's *Polyglotta Africana*, published in 1854, which includes word lists from 10 Gur languages. There was, however, little further mention of Gur languages until the 20th century. Westermann (1927) recognized the validity of Gur as a subfamily. Greenberg (1963) and Bendor-Samuel (1971) confirmed this classification and added considerable detail to earlier work.

The first in-depth study of any Gur language was the extensive work done by Manessy (1975, 1978) and Prost in the 1970s. The Summer Institute of Linguistics began research in Gur languages in northern Ghana in the 1960s; their efforts have produced several studies in recent years (see Naden, 1989).

Languages and Their Classification

Most of the Gur languages belong to two main groups – Central Gur and Senufo – but there are several languages that do not fall into either group. Furthermore, although there is little doubt about the grouping together of the languages in Central Gur and similarly of the languages in Senufo, this bringing together of these two major groups of languages into a single subfamily, Gur, is being increasingly questioned. However, because no other relationship to any other language group is any closer, Senufo remains within Gur for the time being.

Central Gur languages are found in northern Ghana, eastern Burkina Faso, and northern Togo and Benin and break down into two main clusters, Northern and Southern. In the Northern cluster, the Oti-Volta group predominates, with 27 out of 29 languages. These 27 languages can be subdivided into six unequal clusters with the largest, known as Western, having 13 languages, whereas the next largest, Gurma, comprises six languages. The Oti-Volta group includes a number of major languages, such as Moore, Dagaari, Dagbani, Frafra, Mampruli, Kusal (Kusaal), and Konkomba. It is noteworthy that the linguistic relationship among languages in the Oti-Volta group is considerably closer than that among languages in the Grusi group.

In the Southern cluster, the Grusi group comprises 20 of the 29 languages. The Grusi group is more scattered, with the seven eastern languages of the group being completely separated from the four northern and nine western languages by a substantial block of Oti-Volta languages.

Central Gur includes another dozen languages outside the Oti-Volta and Grusi groupings.

The Senufo group comprises 20 languages, of which 10 are related more closely to each other and form a subgroup, Senari. The Senufo languages are found on the western side of the Gur group in the northern Ivory Coast and southwestern Burkina Faso.

A further nine Gur languages do not belong to any of the groupings so far set up within Gur. Detailed studies of many more Gur languages are needed so that the relationships of the languages to each other can be established more clearly.

Structural Features

Phonetics and Phonology

Although there is a great deal of diversity among the Gur languages, a subgroup, such as Oti-Volta, includes languages with many features in common.

Consonant sets often include voiced and voiceless plosives and fricatives and nasals at five points of articulation: labial, alveolar, palatal, velar, and

labiovelar, plus l, y, and w. Phonetic [r] often occurs as a non-initial allophone of /d/.

The geographically contiguous northern and eastern Grusi languages display a vowel harmony system. A systematic contrast in vowel length is common throughout the Gur languages, as is the syllabic nasal.

All Gur languages are marked by contrastive tones, the domain of which is usually the syllable, but may be the word or the morpheme; these tones usually carry grammatical rather than lexical implications. There is no one tonal system; both terrace systems with two tones and downstep and systems with up to four contrastive pitch levels are found.

Both CV and CVC roots occur, as well as C(V) suffixes. In many languages, transitional vowels are inserted to avoid consonant clusters.

Grammar and Syntax

Most Gur languages have singular and plural class suffixes, and in some languages, pronouns and other NP elements concord with the head noun. The contrast between imperfective and neutral forms is very common and usually occurs by means of verbal extensions, though a tone change or vowel lengthening is also found. Other verbal categories are usually shown by particles, auxiliaries, or occasionally tone.

Aspect rather than tense is marked, though 'past' may be contrasted with 'nonpast' or 'future' with 'nonfuture,' and there are often time-depth particles (e.g., 'one day away' may be 'tomorrow' with future or 'yesterday' with nonfuture).

SVO is the predominant word order in Gur languages, though Senufo languages show SOV word order.

Guthrie, Malcolm (1903–1972)

S C O'Rourke, Yale University, New Haven, CT, USA

© 2006 Elsevier Ltd. All rights reserved.

Malcolm Guthrie is widely known for his extensive and methodical research into the comparative linguistics and (pre)history of the Bantu languages of sub-Saharan Africa. Born February 10, 1903 in Hove (East Sussex), England, and having grown up in Ipswich (East Suffolk), Guthrie earned a B.Sc. in metallurgy at Imperial College London. In 1925 he went on to prepare for the ministry at Spurgeon's College, London, where his linguistic prowess became apparent in his study of Greek, Hebrew, and Latin. Guthrie later served as a Baptist pastor in Rochester (Kent) for several years.

Continuing his religious work, Guthrie served as a missionary with the Baptist Missionary Society at locations in the present-day Democratic Republic of the Congo, including Kinshasa (formerly Léopoldville), beginning in 1932. His work in the field spawned a lasting interest in the Bantu languages and it was not long after his arrival in Africa that he published a grammar and dictionary of Lingala (1935, subsequently revised and reprinted in French), a language which would be the subject of much of his later research, along with Chibemba (Bemba). In 1935 Guthrie took up studies at what would become the School of Oriental and African Studies (SOAS/University of London), most notably under Ethel O. Ashton (known for her work on Kiswahili (Swahili) and Luganda (Ganda)), while on furlough from his

labiovelar, plus l, y, and w. Phonetic [r] often occurs as a non-initial allophone of /d/.

Malcolm Guthrie is widely known for his extensive and methodical research into the comparative linguistics and (pre)history of the Bantu languages of sub-Saharan Africa. Born February 10, 1903 in Hove (East Sussex), England, and having grown up in Ipswich (East Suffolk), Guthrie earned a B.Sc. in metallurgy at Imperial College London. In 1925 he went on to prepare for the ministry at Spurgeon's College, London, where his linguistic prowess became apparent in his study of Greek, Hebrew, and Latin. Guthrie later served as a Baptist pastor in Rochester (Kent) for several years.

Continuing his religious work, Guthrie served as a missionary with the Baptist Missionary Society at locations in the present-day Democratic Republic of the Congo, including Kinshasa (formerly Léopoldville), beginning in 1932. His work in the field spawned a lasting interest in the Bantu languages and it was not long after his arrival in Africa that he published a grammar and dictionary of Lingala (1935, subsequently revised and reprinted in French), a language which would be the subject of much of his later research, along with Chibemba (Bemba). In 1935 Guthrie took up studies at what would become the School of Oriental and African Studies (SOAS/University of London), most notably under Ethel O. Ashton (known for her work on Kiswahili (Swahili) and Luganda (Ganda)), while on furlough from his

mission work. After his service as a missionary came to an end in 1940, he became a lecturer and, in 1942, senior lecturer at SOAS upon his return to England. Guthrie published a Lingala translation of the New Testament in 1942. He returned to Africa in 1942 to conduct linguistic fieldwork on a variety of Bantu languages and remained there until 1944. The data gathered during that visit would play a major role in Guthrie's later work, especially on Chibemba and his comparative studies of Bantu.

After returning to England once again, Guthrie was awarded a doctorate by the University of London in 1945 for his thesis entitled 'The tonal structure of Bemba.' Tonology would be of lasting interest to Guthrie. His growing attention to the areas of comparative language studies and classification resulted in the appearance of *The classification of the Bantu languages* in 1948. Guthrie became Reader in Bantu Languages in 1947 and beginning in 1950 and for the next 18 years, he headed the Department of the Languages and Cultures of Africa at SOAS. From 1951 until his retirement in 1970, Guthrie was Professor of Bantu Languages in the same department, which grew dramatically under his leadership. He also served on a wide variety of school (SOAS), university (London), and external administrative boards and committees and was Master of Downing College at Cambridge University from 1957 to 1972.

Although much of Guthrie's work is focused on particular languages such as Chibemba and Lingala, his comprehensive research on comparative Bantu encompassed over 200 languages. Guthrie established genetic relationships between Bantu languages with his two-stage method, which first involved collecting into comparative series cognate lexical items (those with similar meaning and which could be related by regular sound correspondences) from various languages. The relationships between the lexical items in each series were then symbolized using starred forms from the hypothetical proto-language referred to as Common Bantu. This work enabled Guthrie to hypothesize, in the second stage, about the origins of the Bantu languages and their speakers. The fruits of Guthrie's line of research using his empirical methodology would first appear in 1967 in his highly anticipated *Comparative Bantu,* still a standard reference and driving force in the field of African linguistics.

In 1968 Guthrie was elected a Fellow of the British Academy. His wife since 1931, Helen Margaret (née) Near, died that same year. Guthrie himself died November 22, 1972 from a heart attack. A great deal of his work on further comparative studies and on Chibemba, Lingala, and the Teke languages was left unfinished or still in the planning stages.

The Language and Its Speakers

Guugu Yimithirr (Gu:guyimidjir) (hereafter GY) is the language originally spoken in the area between the Annan and Jeannie Rivers on the coast of northeast Queensland and inland. Most of its modern speakers now cluster around Cooktown, at the mouth of the Endeavour River. The language name combines *guugu* 'word' or 'language' with the comitative *yimi-thirr* 'this way' – thus, 'this kind of language' or 'speaking this way.' (Contrast the name of its southern sister Kuku-Yalanji, which has *yala* for GY *yii* 'this, thus.') GY contributed Australia's most widespread loanword to the languages of the world, via the word *gangurru* [IPA *g'aŋuru*] 'large grey wallaroo,' which was recorded as 'kangaroo' by members of Captain Cook's crew during their stay on the shores of the Endeavour in 1770. Speakers of the language were spared further contact with Europeans for about 100 years, when gold was discovered inland at the Palmer River in the mid-1870s. The consequent gold rush and invasion of the territory by settlers decimated local Aboriginal populations, and within 10 years the few surviving speakers of GY lived in scattered hunter-gatherer bands pushed off their lands or on the fringes of Cooktown and other smaller towns. A Lutheran mission established on barren land at Cape Bedford in 1885 became a refuge for the remaining GY speakers, and GY was the lingua franca of the community as legislation relocated Aboriginal children from a wide area – including many who spoke different languages – at the mission school. The earliest written information about GY derives from the Cape Bedford missionaries, systematized by W. E. Roth, the first Northern Protector of Aborigines. The 20th century saw a severe GY diaspora, as speakers of the language who had migrated to Cooktown and Cape Bedford were forcibly relocated to southern Queensland during World War II, and returned to their homeland in only a fraction of their already reduced numbers in the 1950s. Nowadays, though most GY speakers still live around Cooktown, others are scattered through other Queensland Aboriginal communities, and as far away as Melbourne and New Zealand. Despite repeated predictions, starting in the 1920s, that GY was on the verge of extinction, the language remains a central feature of life at the Hopevale community north of

The Language and Its Speakers

Guugu Yimithirr (Gu:guyimidjir) (hereafter GY) is the language originally spoken in the area between the Annan and Jeannie Rivers on the coast of northeast Queensland and inland. Most of its modern speakers now cluster around Cooktown, at the mouth of the Endeavour River. The language name combines *guugu* 'word' or 'language' with the comitative *yimi-thirr* 'this way' – thus, 'this kind of language' or 'speaking this way.' (Contrast the name of its southern sister Kuku-Yalanji, which has *yala* for GY *yii* 'this, thus.') GY contributed Australia's most widespread loanword to the languages of the world, via the word *gangurru* [IPA *g'aŋuru*] 'large grey wallaroo,' which was recorded as 'kangaroo' by members of Captain Cook's crew during their stay on the shores of the Endeavour in 1770. Speakers of the language were spared further contact with Europeans for about 100 years, when gold was discovered inland at the Palmer River in the mid-1870s. The consequent gold rush and invasion of the territory by settlers decimated local Aboriginal populations, and within 10 years the few surviving speakers of GY lived in scattered hunter-gatherer bands pushed off their lands or on the fringes of Cooktown and other smaller towns. A Lutheran mission established on barren land at Cape Bedford in 1885 became a refuge for the remaining GY speakers, and GY was the lingua franca of the community as legislation relocated Aboriginal children from a wide area – including many who spoke different languages – at the mission school. The earliest written information about GY derives from the Cape Bedford missionaries, systematized by W. E. Roth, the first Northern Protector of Aborigines. The 20th century saw a severe GY diaspora, as speakers of the language who had migrated to Cooktown and Cape Bedford were forcibly relocated to southern Queensland during World War II, and returned to their homeland in only a fraction of their already reduced numbers in the 1950s. Nowadays, though most GY speakers still live around Cooktown, others are scattered through other Queensland Aboriginal communities, and as far away as Melbourne and New Zealand. Despite repeated predictions, starting in the 1920s, that GY was on the verge of extinction, the language remains a central feature of life at the Hopevale community north of

Cooktown, and there are currently more than 1000 speakers of the language, which has undergone rapid change over the past half-century.

Genetic Relations

GY is fairly typical of northern Paman languages, and is very closely related to Kuku Yalanji, still a relatively healthy language spoken in the rainforest to the south, with which it has perhaps 40%–50% lexical overlap. GY has a fairly typical Australian phonemic inventory. Although most stems are disyllabic and consonant initial, GY is closely related to the now extinct 'initial dropping' languages originally spoken to the north at Barrow Point and Flinders Island. Early accounts describe two varieties of GY, one *thalun-thirr* or 'coastal' and the other *waguurr-ga* 'inland,' though most diagnostic coastal lexical items have given way in modern speech to forms judged to be from the inland dialect. The language is now frequently written in a practical orthography which distinguishes two laminal series of stops and nasals (*th* and *nh* for laminodentals [d̪] and [n̪], and *j* and *ny* for laminopalatals [ɟ] and [ɲ], respectively), although earlier orthographies still survive, including one developed by missionaries which omits laminal (and other) contrasts entirely. Rhotics contrast between an alveolar trilled *rr* and a retroflex *r* [ɽ]. There is a typical three-way vowel contrast between *i*, *u*, and *a*, and vowel length is phonemic. There is further a complex interaction between vowel length, canonical stress and syllable patterns, and suffixing morphology. (Long vowels are doubled in the practical orthography; in this article a colon marks a 'lengthening' suffix, and a dollar sign a shortening one – see below.)

Basic Facts

GY is wholly suffixing, with free personal pronouns (which follow a nominative/accusative case-marking pattern – contrasting with ergative/absolutive morphology on other nominal elements) and no bound pronominal forms. Pronouns, normally only referring to animate entities, distinguish three persons, three numbers (singular, dual, and plural), and, for some speakers, also an inclusive/exclusive distinction in nonsingular first person. The case system is elaborate, with a variety of 'local' (locative/allative, ablative [= causative], superessive, abessive, adessive [= goal]) and peripheral syntactic cases (dative, purposive, instrumental) in addition to those marking the core syntactic relations of subject and object. This case system is elaborated still further with the morphologically hypertrophied cardinal direction roots, detailed below. Genitive constructions allow dual case marking, where a possessed nominal functions in some further case-marked role, as in the following examples (which also show the ergative/absolutive patterning of nouns and the nominative/accusative pattern of pronouns).

(1) nyulu yarrga thadaara biibaa-:ga-mi.
3S.NOM *boy.ABS* *go.REDUP.NONP* *father-GEN-LOC/ALL*
'the boy is going to his father's place.'

(2) jirraayn-da nyulu ngaliinh bama
man-ERG *3S.NOM* *2DU.ACC* *man.ABS*
ngarrbal daama-y
strange.ABS *spear-PAST*
galga thawuuny-ga-mun
spear *friend-GEN-INST*
'the man speared me and a stranger with a friend's spear.'

Verbs fall into three main conjugations, with several minor additional patterns. Morphologically productive verbal categories are again numerous, including past and nonpast tenses, repetitive and continuous aspects, and such moods as contrafactual, desiderative, cautionary, precautionary or 'lest' forms, and a morphologically incorporated negative (in addition to a periphrastic negative construction). A multifunctional verbal suffix -:*thi* marks a syntactically complex reflexive/reciprocal construction, as outlined below.

Word order is completely free, and there is no discernable favored or unmarked order for clausal or, indeed, phrasal constituents. Each word of a discontinuous nominal constituent, including determiners and adjectives, can be marked individually for case. Animate noun phrases frequently appear with both a full nominal head as well as the appropriate case form of an apparently pleonastic pronoun, so that the nominative/accusative case-marking pattern of pronouns frequently coexists within the same clause with the ergative/absolutive morphology on other nominal constituents.

Shortening vs. Lengthening Suffixes and the Rhythmic Canons

GY shows an intriguing interaction between suffixation, vowel length, and stress. Virtually all monosyllabic lexical words have stressed long vowels, and long vowels are usually also stressed. The language

seems to favor a syncopated syllabic pattern, with alternate syllables short and long, unstressed and stressed. Thus, for example, the progressive aspect is formed by a complex partial reduplication of disyllabic verb stems to produce trisyllabic stems, whose middle syllable is a lengthened (and stressed) version of the original second syllable. Thus, *balgal* 'he'll make it' vs. *balgaalgal* 'he is making it.' In addition, suffixes differ according to how they affect stress and length in the stem to which they attach. Most suffixes engender length (when it is not already present) on all disyllabic stems ending in a nonnasal consonant. Thus, *gambul* 'belly' + *-hi* 'LOC' → *gambuulbi* 'in the belly.' Other 'lengthening suffixes' additionally engender length even on disyllabic vowel-final stems. Thus, *yugu* 'fire' + *-:ngu* 'PURPosive' → *yuguungu* 'for the fire.' Still other 'shortening' suffixes shorten the long vowel in the second syllable of a disyllabic stem. Thus, *buurraay* 'water' + *-$a* 'PURP' → *buurraya* 'for water.'

The Morphology and Semantics of Cardinal Directions

Rather than base locative expressions on body-relative or egocentrically anchored perspectives, GY, like many other Australian languages, uses locational descriptors which insistently incorporate cardinal directions. Four lexical roots, *gungga-*, *jiba-*, *naga-*, and *guwa-*, correspond roughly to the English directions north, south, east, and west, respectively, except that the GY terms denote compass quadrants rather than idealized points. In virtually all circumstances, GY speakers keep track of cardinal orientation and incorporate the appropriate directional terms into descriptions of both distant places and immediate locations. In answer to a question like 'Where are you going?' one will answer, for example, *nagaar bayan-bi* 'east to the house.' To tell someone to move a bit 'that way' one must add the correct direction: *yarrba guwa-manaayi* 'move a bit that way to the west' (literally, 'thus west-be').

Whereas ordinary nominal expressions have just a single LOCative/ALLative form, and another ABLative form, the directional roots have more elaborated morphological possibilities. The LOC/ALL forms, for example with the root *naga* 'east,' number three:

(3) LOC/ALLforms
naga (0-form, 'east from a point')
naga-ar (R-form, 'to a point east')
naga-alu (L-form, 'east, over some point or obstacle')

Though all denote, in this case, motion in an easterly direction from some origo, each incorporates a different perspective or set of locational presuppositions. The least marked 0-form concentrates on the starting point of the trajectory, or emphasizes setting out toward the east. The second R-form focuses on the end point of the trajectory, also in the east, or emphasizes arrival. The third L-form is the most highly marked, presupposing some known or inferable location to the east through or beyond which the current trajectory is conceived to pass. Similar elaboration extends to ablative and other locational case morphology, providing delicate resources for GY directional precision.

The Syntax and Semantics of the 'Reflexive' Suffix *-:thi*

GY transitive verbs ordinarily require animate subject NPs, whose referents are in an agent thematic role, conceived of as consciously and voluntarily controlling an action performed on some normally distinct object – the theme or patient argument.

(4) nyundu minha wagi naaybu-unh
2s.NOM *meat*.ABS *cut*.PAST *knife*-INST
'you cut the meat with a knife.'

GY has a productive 'reflexive' construction, with the lengthening suffix *-:thi,* which encodes a basic variant of this situation, when agent and patient arguments are coreferential:

(5) ngayu(-ugu) wagi-ithi naaybu-unh
1s.NOM(-EMPH) *cut*-REFL *knife*-INST
'I cut myself with a knife.'

Interestingly, GY uses the same verbal inflection, with varying case forms on the accompanying arguments, to encode other sorts of situation which depart from the canonical transitive situation characterized above. Thus, for example, in a situation appropriate to what in other languages might be encoded by a passive construction – for example, when there is no agent, or when the agent only accidentally acts, or when the organization of the discursive context promotes the object of the action to a position of prominence – GY uses the same *-:thi* suffix on the verb.

(6) nganhi wagi-ithi naaybu-unh
1s.ACC *cut*-REFL *knife*-INST
'I got cut on the knife (by accident).'

Similarly, in a kind of generalized action in which no specific agent can be singled out, GY also has recourse to *-:thi.* A typical example might be

(7) nyulu gunda-athi
3s.NOM hit-REFL
'he had a fight/was in a fight.'

There is also a small group of GY verbs which occur **only** in 'reflexive' form with *-:thi*, mostly denoting actions typically performed without conscious outside agency ('come to an end,' 'explode,' 'finish,' among others).

Language Situation and Sociolinguistic Features

Because of the particular history of its speech community, and the rapidly shifting conditions under which it is learned and spoken, GY is a language in a dramatic state of flux and variation. The mix of 'tribal' origins of its modern-day speakers, and the range of circumstances in which it serves as a medium of interaction, have produced different levels or registers in which GY and different varieties of Aboriginal and standard English combine.

Traditionally in this part of the Cape York peninsula, Aboriginal people were polyglots, often practicing linguistic exogamy and able to communicate as they traversed dialect and language areas. Even within single dialects, other socially significant linguistic varieties, such as the so-called mother-in-law or brother-in-law languages, provided linguistically marked ways of displaying deference to certain classificatory kinsmen, or of marking intimacy with others. Historically, as speakers of different Aboriginal languages (as well as creolized varieties of other contact languages) either congregated or were forcibly brought together at the Cape Bedford mission, GY became the native language of many people who still had ancestral ties to other 'tribal' languages. As knowledge faded of these other languages, so too did the specialized subvarieties of GY disappear, since they were systematically linked to social practices and processes of transmission which were radically altered by the sometimes violent upheavals in Aboriginal society.

In modern Hopevale, and around Cooktown, where the great majority of current GY speakers live, the language is still widely used, although it has a diglossic functional relationship with English. In the somewhat anarchic conditions of language acquisition in this fragmented speech community, the language is also undergoing probably accelerated simplification, as paradigms once fraught with irregularity are allowed to conform to more productive morphosyntactic patterns. Moreover, different generations in the community, with different kinds of schooling and a variety of personal backgrounds and competence in Australian English, mix English and GY freely in a typified and self-identifying variety of Hopevale English which combines GY pronouns and individual lexical items with a largely English syntax.

Guyana: Language Situation

E B Carlin, Leiden University, Leiden, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

The sole official language of Guyana is English, a reflection that this country was a British colony (British Guiana) from 1803 to 1966, when it became independent. The population of just over 700 000 is multicultural, with the largest sector (50%) of the population of East Indian origin, the second largest (36%) of Creole (African) origin, 7% of Amerindian origin, and 7% of white, mixed, and Chinese origin. The majority of the population live in the coastal area, and the interior of the country is inhabited mostly by Amerindians.

Besides the official language, English, which is the medium of instruction in education and the language of the mass media, a widespread language in Guyana is the lingua franca, Creolese (Guyanese Creole English), an English-based creole language. Most cultural and/or ethnic groups, however, have their own languages. Creolese is used for interethnic communication and in informal settings; in addition, Creolese is used in several radio programmes. There are several varieties of Creolese that are attributable to the location (urban versus rural) and ethnic background of the users; these varieties form a creole continuum. The East Indian section of the population uses Hindi or Urdu for religious and ritual purposes, and many use Guyana Overseas Hindi, closely related to Surinamese Sarnami, in informal settings. In general, Guyana boasts a high literacy rate (*ca.* 95%), albeit mostly in English.

The largest number of different languages is spoken by the Amerindian groups, totalling ten languages. Six of the Amerindian languages belong to the Cariban language family, two belong to the Arawakan language family, and two are isolates. An overview of the Amerindian languages is given below, with alternative names in parentheses. Although there are few data on actual speaker numbers for the Amerindian languages, each language is followed by two numbers, first the number of the ethnic group (E), and the approximate number of speakers (S), where known. All of these languages are seriously endangered and are being replaced by English and/or Creolese. One factor that plays an important role in the spread of Creolese is that large portions of the population in and near the urban centers are of mixed origin. In particular, the Lokono and Warao now form highly mixed communities.

Cariban family:	Kari'na (Carib) (E: 3000); Akawaio (Kapon) (E: 3500); Patamona (Kapon) (E: 5000); Makushi (Pemon) (E: 7000; S: <5000); Arekuna (Pemon) (E and S: 450); Waiwai (E and S: 300)
Arawakan family:	Lokono (Arawak) (E: 15 000; S: <1000); Wapishana (E: 7000; S: <5000)
Isolates:	Warao (E and S: no data); Taruma (E and S: 5)

The status of the Amerindian languages is very low, and since the language of education is English, these languages are rapidly losing ground to English, although in recent years attempts have been made to produce teaching materials in some of the languages (e.g., Makushi and Wapishana).

Gyarmathi, Sámuel (1751–1830)

V E Hanzeli

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 3, pp. 1516–1517, © 1994, Elsevier Ltd.

Gyarmathi, medical doctor and pioneer of descriptive and comparative linguistics, was born in Kolozsvár (Rumanian: Cluj; German: Klausenburg), Transylvania on July 15, 1751, son of a Calvinist, middle-class family. He was educated in the colleges of Kolozsvár and Nagyenyed (Rumanian: Aiud; German: Strassburg), whose liberal curriculum, dominated by the philosophy of Christian Wolff, included a solid preparation in the natural sciences. He studied medicine on an Imperial scholarship at the University of Vienna and graduated M.D. in 1776. During his later life he was attached to the household of important noble families in Transylvania, appointments which allowed him to devote most of his time to his favorite endeavor: language studies. He died in the town of his birth on March 4, 1830.

In 1794 he published the first comprehensive grammar of Hungarian and the first 'grammaire raisonée' of a Central European language *Okoskodva Tanító Magyar Nyelvmester* (*Hungarian Grammar Taught Rationally*). After studying in Göttingen under A. L. Schlözer he wrote the first comparative study of the Finno–Ugric language family (1799), based on both lexicon and grammatical structure (following the more narrowly based model of J. Sajnovics (*see* **Sajnovics, Janos (1735–1785)**). His *Vocabularium* (1816) was the first attempt at an etymological dictionary of Hungarian. He also translated works of J. H. Campe, and played an important role in the Hungarian language reform movement. He was a member of the Society of Natural History of Jena, and a corresponding member of the Learned Society of Göttingen.

1981. In 1985 he was a visiting professor at the University of Warsaw.

Geach has written influentially on many topics in the history and philosophy of logic. He did much to show that the problems regarding the meaning of linguistic expressions that have exercised medieval logicians are the same as the problems addressed by modern ones. He also argued that several central elements of the pre-Fregean logical tradition, in particular the theory of the distribution of terms, are ill-conceived and unsound. Geach strongly opposed the dominant trend in British philosophy during the 1950s and 1960s known as 'ordinary language philosophy,' especially the then popular view that ordinary language has nothing to do with formal logic. His *Reference and generality* (1962) was meant as an extended proof to the contrary, containing as it does numerous applications of logical techniques to the analysis of English sentences. Geach's observations and theses in this area have greatly stimulated research in formal semantics. The most famous example of this is his discussion of the nature of reference involved in the sentence 'Any man who owns a donkey beats it' (1962: 117), which has engendered a widespread concern with so-called 'donkey sentences' and with the semantics of anaphoric pronouns in general.

Geach has also applied methods of logical analysis to the philosophy of mind (*Mental Acts*, 1957) and to the philosophy of religion (*God and the Soul*, 1969). In ethics (*The Virtues*, 1977), he has sought to revive an Aristotelian type of doctrine of the virtues.

Gəʿəz

S Weninger, Philipps-Universität, Marburg, Germany

© 2006 Elsevier Ltd. All rights reserved.

Gəʿəz (Gəʿəz, Classical Ethiopic, Old Ethiopic) is the classical language of Ethiopia. Gəʿəz belongs to the Northern branch of Ethio-Semitic, which is part of South Semitic, a subgroup of the Semitic languages. The earliest extant texts are inscriptions from the 3rd century found in Northern Ethiopia, especially in the city of Aksum. From this time, Gəʿəz maintained its exclusive status as a medium of formal communication, until the 19th century, when it gave way to Amharic. Within the Ethiopian Orthodox Church it still holds a position comparable to the status of Latin in Catholicism. Gəʿəz was also the liturgical language of the Jewish community of Ethiopia, the Betä ʾƎsraʾel.

Gəʿəz is written in a quasi-syllabic script, developed on the basis of the Sabaean alphabet. Each sign represents either a combination of a consonant and a vowel or a simple consonant, e.g., አቡነ፡ ዘበሰማያት፡, representing the sequence *ʾa-bu-nä zä-bä-sä-ma-ya-t*, pronounced *ʾabunä zäbäsämayat* (‘Our father who art in heaven’). In its classical form, Gəʿəz phonology comprises 26 consonants plus a set of four labialized velar obstruents and seven vowels. Noteworthy are sets of lateral, pharyngeal, and laryngeal obstruents as well as a set of ejectives. In the traditional pronunciation as practiced by learned Ethiopians, many consonantal distinctions are lost under the influence of modern Ethio-Semitic languages.

Gəʿəz has a rich morphology based on the common Semitic system of three or four consonantal roots and vocalic patterns, with prefixes and suffixes used both in derivation and inflection, as in *ṣäḥafä* ‘he wrote’, *ṣäḥafku* ‘I wrote’, *nṣḥf* ‘we shall write’, *ṣäḥafi* ‘scribe’, and *mäṣḥaf* ‘book’. Grammatical categories of the noun are gender (male/female), number (singular/plural), and case (nominative-genitive/accusative). The verb has five tense–aspect–mood (TAM) categories (perfect, imperfect, jussive, imperative, and converb). Other categories of the verb are person, number (singular/plural), and gender (male/female, also for second person!). The syntax is based on a rather loose verb-subject-object word order, and agreement is not strict.

The vocabulary of Gəʿəz is to a large degree common Semitic. However, loanwords from Cushitic languages, especially Central Cushitic languages, form a sizable part of the Gəʿəz lexicon. Contacts with the Church of Alexandria paved the way during late antiquity for many Greek and, during the Middle Ages, Arabic loanwords. On the one hand, Gəʿəz shares many typological features with the Asian Semitic languages, such as Arabic or Hebrew. On the other hand, it shows features known from the modern Ethio- Semitic languages, which belong to the Ethiopian language area, also shared by the Cushitic languages, with their subject-object-verb syntax. The converb, already present in Gəʿəz, is typical for this area.

Gelb, Ignace J. (1907–1985)

G Buccellati, University of California, Los Angeles, CA, USA

© 2006 Published by Elsevier Ltd.

Coming from a strong philological background, Gelb developed an ever greater interest in theory, which he felt would help him better understand the data. This was within the atmosphere of great intellectual ferment that characterized the University of Chicago in the formative period of Gelb’s intellectual career, i.e., from the 1940s to the 1960s (and that, linguistically, can be characterized as Bloomfieldian structuralism). Within the Oriental Institute itself, other great Assyriologists were developing analogous interests, in particular Thorkild Jacobsen and Erica Reiner. This developing interest in theory took him in two major directions: the social sciences and linguistics. As a result, he did seminal work in both areas within the field of Assyriology, pioneering especially the application of a coherent methodology to explain structural relationships within the data. Besides linguistics, he contributed immensely to the study of socioeconomic structures in ancient Syro-Mesopotamia. His philological control of the data remained unparalleled throughout his career, lending an even greater credibility to his efforts.

He was born October 14, 1907, in Tarnow, Poland. He left when he was 18 to study first in Florence, Italy, and then in Rome, where he studied Semitic philology, and became particularly close to Giorgio Levi della Vida; he concluded his studies with a doctorate (laurea) from the University of Rome in 1929. He then went to the Oriental Institute of the University of Chicago, where he remained for the rest of his life. As a traveling fellow and research Associate from

H

Haas, Mary Rosamond (1910–1996)

A Kaye, California State University, Fullerton, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

Haas, one of the products of Edward Sapir's Yale years, was, like her mentor, a linguist who knew many languages. She is best known for her research in four areas: (1) fieldwork, grammars, dictionaries, and diachronic investigations of various American Indian languages, such as Nitinat (the language of her first co-authored publication with Morris Swadesh, then her husband [Haas Swadesh and Swadesh, 1932]), based on fieldwork done on Vancouver Island the previous year), Tunica (a language isolate spoken in Louisiana – the subject of her 1935 Yale Ph.D. dissertation), Biloxi, Choctaw, Creek (Muskogee), Hichiti, Koasati, Mobilian Jargon (Mobilian), etc.; (2) studies on Thai, and to a lesser extent Burmese, such as a co-authored Thai reader (Haas and Subhanka, 1945), a co-authored textbook (Haas and Subhanka, 1946, 1948), an analysis of the Thai writing system (Haas, 1956b), and a comprehensive dictionary (Haas, 1964); (3) general historical linguistic theory and methodology (typical are Haas, 1966a and 1969); and (4) applied linguistics (Haas, 1943, 1953b).

Haas was born on January 23, 1910 in Richmond, Indiana. She attended Earlham College in her hometown, majoring in music and classics and graduating in 1930. Having read William Dwight Whitney and Henry Sweet while still an undergraduate, she became interested in linguistics and comparative philology, and in 1930 enrolled at the University of Chicago to study under Carl Darling Buck. She completed a course in Germanic linguistics (taught in German [German, Standard]) there with Leonard Bloomfield, but upon taking a course in the anthropology department with Edward Sapir, in which his book *Language: An introduction to the study of speech* (1921) was meticulously discussed, she was enthusiastically converted to Sapirian linguistic anthropology.

She accompanied her husband and Sapir (the newly appointed Sterling Professor of Linguistics and Anthropology) to Yale in 1931, where she took courses with Yale's other well-known linguists: Edgar H. Sturtevant, Eduard Prokosch, and Franklin Edgerton. Under Sapir's tutelage, she began her fieldwork in 1932 on the isolate Tunica with its last speaker, eventually publishing a grammar (Haas, 1941, a revised version of her dissertation), short sketch (Haas, 1946b), dictionary (Haas, 1953a), and collection of texts (Haas, 1950). She also did fieldwork on another endangered language, the isolate (now extinct) Natchez, in the 1930s, demonstrating her broad interests in the field of American Indian languages and following in Sapir's footsteps. She eventually became an authority on the Muskogean family, reconstructing Proto-Muskogean (Haas, 1946a, 1947, 1949, 1956). She also made contributions to the study of other American Indian families, such as Algonkian (Haas 1958a, 1958b, 1966b, 1967) and Hokan (especially Karuk (Karok); see the last three essays in Haas, 1978).

When World War II broke out, Haas was recruited in 1940, as were so many other of her contemporaries, to investigate and teach languages deemed important for the war effort. She began in 1940 to prepare pedagogical materials for the teaching of spoken Thai, first in Washington, D.C., and then at the University of Michigan from 1941–1943. After revising these materials, she went to the University of California, Berkeley to join the staff of the Army Specialized Training Program (the Director was A. L. Kroeber). She remained in Berkeley on an American Council of Learned Societies fellowship, and in 1946 became a research associate in the Department of Oriental Languages. She was appointed lecturer in Thai in 1947, and in the following year she was promoted to assistant professor of Thai and linguistics. Her work on Thai and Burmese focused on tonology, grammatical analysis (e.g., numeral classifiers; see Haas 1951), linguistic anthropology, sociolinguistics, writing essays on interlingual word taboos, word games, disguised speech, etc. She also pioneered applied linguistics by explaining how linguists could serve as teachers of foreign languages (Haas, 1943, 1953b). Similar topics were very much a pivotal part of her American Indian research; e.g., numeral classifiers, male/female language, sibling

terms used by marriage partners, etc. (many of her best-known essays are reprinted in Haas, 1978).

In 1953, Haas moved to the newly established Department of Linguistics at UC Berkeley as associate professor. She was acting chair of linguistics during 1956 and 1957 and chair from 1958 to 1964. She and Murray B. Emeneau founded the Survey of California Indian Languages in 1953; its first grantee was William Bright (the longtime editor of *Language*), who worked on Karuk for his Ph.D. dissertation. Many Berkeley Ph.D. dissertations were sponsored by the Survey, and some of those were published in the University of California Publications in Linguistics series. She was professor of linguistics at UC Berkeley from 1957–1977, and was chosen to serve as the Faculty Research Lecturer (the most prestigious honor bestowed on a Berkeley faculty member) for 1964 and 1965, which resulted in Haas (1969). She was elected to the American Academy of Arts and Sciences in 1974 and the National Academy of Sciences in 1978. She also held fellowships from the Guggenheim Foundation and the Center for Advanced Studies in the Behavioral Sciences. She was vice president of the Linguistic Society of America in 1956 and its president in 1963. She was also the Linguistic Society of America Professor in 1970.

Among her numerous awards, she received honorary doctorates from Northwestern University (1975); University of Chicago (1976); Earlham College (1980); and Ohio State University (1980). She was named Distinguished Lecturer of the American Anthropological Association in 1976, and when she retired the following year was awarded the Berkeley Citation (the highest honor the University can bestow) as well as the Wilbur Lucius Cross Medal by the Yale Graduate School Association. After retirement, she also accepted many visiting professorships in the United States and abroad. She was the recipient of three Festschrifts (e.g., Shipley, 1988).

Haas died on May 17, 1996 in her home in Berkeley. Further details of her life and career may be found in Golla *et al*. (1997).

Habermas, Jürgen (b. 1929)

J Maat, Universiteit van Amsterdam, Amsterdam, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Jürgen Habermas is one of the foremost social theorists and political philosophers of postwar Germany. He was born in Düsseldorf on June 18, 1929, and grew up in the town of Gummersbach. In the autumn of 1944, at the age of 15, he was sent to the front to serve as an assistant in the sickbay. He returned home in February 1945, three months before the final collapse of the Third Reich. Finishing his secondary school in the following years, he learned to appreciate the 'bourgeois constitutional state' as a historic achievement. He went to the University of Göttingen in 1949, spent a short period studying in Zürich and moved to Bonn in 1950, where he studied philosophy, history, psychology, German literature, and economics with Erich Rothacker and Oskar Becker. In a newspaper article published in 1953, he exposed Heidegger's association with Nazism. After obtaining his Ph.D. in 1954, he worked as a journalist. He married Ute Wesselhoeft in 1955; they had a son and two daughters. In 1956, Habermas became a research assistant to Theodor Adorno at the Institute for Social Research in Frankfurt, which was led by Adorno and Max Horkheimer. Thus involved with the Frankfurt school of philosophy, he developed a neo-marxist critical theory of society, which emphasized the importance for democracy of a public debate that is undistorted by financial and administrative powers. Because of a conflict with Horkheimer, he resigned in 1959 and managed to get a scholarship to finish the thesis for his second doctorate (Habilitation), which he obtained in 1961 under the supervision of Wolfgang Abendroth (*Strukturwandel der Öffentlichkeit*, 1962). At the recommendation of Hans-Georg Gadamer, Habermas was appointed professor of philosophy at Heidelberg in 1961. Taking sides with Adorno in the so-called 'Positivismusstreit,' he argued against Popper's critical rationalism that a critical social theory differs essentially from natural science. He stayed at Heidelberg until 1964, when he had the opportunity to become professor of philosophy and sociology at the University of Frankfurt. In the following period, he further established himself as a leading intellectual, whose views were influential, though not uncontroversial, in the student protest movement of the late 1960s. In this period he also traveled to the United States, where he held various visiting positions.

Habermas left the university in 1971 to become co-director, with Carl Friedrich von Weizsäcker, of the 'Max Planck Institute for research of the life conditions of the scientific-technical world' at Starnberg. During this period, he initiated a research program that he has been pursuing for the rest of his career, and which centers around communicative action. In 1981, he published his magnum opus, the 2-volume *The theory of communicative action* (Habermas, 1981). In 1983 he returned to the University of Frankfurt, where he once again became professor of philosophy. This period was marked by his vigorous defense of the emancipatory potential of modernist thought against the attacks by postmodernist, deconstructivist thinkers (*The philosophical discourse of modernity*, Habermas, 1985), and by the elaboration of his theory of communicative action in the field of ethics (*Justification and application: remarks on discourse ethics*, Habermas, 1991) and philosophy of law (*Between facts and norms: contributions to a discourse theory of law and democracy*, Habermas, 1992). After his retirement in 1994, he continued to write influentially on a number of political and cultural issues, such as the social implications of developments in biomedical science, and the political consequences of terrorism.

From a linguistic perspective, Habermas's main accomplishment was his attempt to put insights gained from the study of everyday linguistic practice at the heart of a theory of rational action and of society at large. Drawing on the work of Bühler, Austin, and Searle, he used a typology of speech acts to characterize the kind of rationality which underlies communicative action, and which he viewed as a potential for emancipation. He started from a distinction between success-oriented action and consent-oriented action. The former is exemplified both by

Jürgen Habermas is one of the foremost social theorists and political philosophers of postwar Germany. He was born in Düsseldorf on June 18, 1929, and grew up in the town of Gummersbach. In the autumn of 1944, at the age of 15, he was sent to the front to serve as an assistant in the sickbay. He returned home in February 1945, three months before the final collapse of the Third Reich. Finishing his secondary school in the following years, he learned to appreciate the 'bourgeois constitutional state' as a historic achievement. He went to the University of Göttingen in 1949, spent a short period studying in Zürich and moved to Bonn in 1950, where he studied philosophy, history, psychology, German literature, and economics with Erich Rothacker and Oskar Becker. In a newspaper article published in 1953, he exposed Heidegger's association with Nazism. After obtaining his Ph.D. in 1954, he worked as a journalist. He married Ute Wesselhoeft in 1955; they had a son and two daughters. In 1956, Habermas became a research assistant to Theodor Adorno at the Institute for Social Research in Frankfurt, which was led by Adorno and Max Horkheimer. Thus involved with the Frankfurt school of philosophy, he developed a neo-marxist critical theory of society, which emphasized the importance for democracy of a public debate that is undistorted by financial and administrative powers. Because of a conflict with Horkheimer, he resigned in 1959 and managed to get a scholarship to finish the thesis for his second doctorate (Habilitation), which he obtained in 1961 under the supervision of Wolfgang Abendroth (*Strukturwandel der Öffentlichkeit*, 1962). At the recommendation of Hans-Georg Gadamer, Habermas was appointed professor of philosophy at Heidelberg in 1961. Taking sides with Adorno in the so-called 'Positivismusstreit,' he argued against Popper's critical rationalism that a critical social theory differs essentially from natural science. He stayed at Heidelberg until 1964, when he had the opportunity to become professor of philosophy and sociology at the University of Frankfurt. In the following period, he further established himself as a leading intellectual, whose views were influential, though not uncontroversial, in the student protest movement of the late 1960s. In this period he also traveled to the United States, where he held various visiting positions.

Habermas left the university in 1971 to become co-director, with Carl Friedrich von Weizsäcker, of the 'Max Planck Institute for research of the life conditions of the scientific-technical world' at Starnberg. During this period, he initiated a research program that he has been pursuing for the rest of his career, and which centers around communicative action. In 1981, he published his magnum opus, the 2-volume *The theory of communicative action* (Habermas, 1981). In 1983 he returned to the University of Frankfurt, where he once again became professor of philosophy. This period was marked by his vigorous defense of the emancipatory potential of modernist thought against the attacks by postmodernist, deconstructivist thinkers (*The philosophical discourse of modernity*, Habermas, 1985), and by the elaboration of his theory of communicative action in the field of ethics (*Justification and application: remarks on discourse ethics*, Habermas, 1991) and philosophy of law (*Between facts and norms: contributions to a discourse theory of law and democracy*, Habermas, 1992). After his retirement in 1994, he continued to write influentially on a number of political and cultural issues, such as the social implications of developments in biomedical science, and the political consequences of terrorism.

From a linguistic perspective, Habermas's main accomplishment was his attempt to put insights gained from the study of everyday linguistic practice at the heart of a theory of rational action and of society at large. Drawing on the work of Bühler, Austin, and Searle, he used a typology of speech acts to characterize the kind of rationality which underlies communicative action, and which he viewed as a potential for emancipation. He started from a distinction between success-oriented action and consent-oriented action. The former is exemplified both by

instrumental actions using nomological knowledge of nature, and by strategic actions aimed at achieving coordination between rational agents. By contrast, consent-oriented action consists of a cooperative attempt to reach agreement about the interpretation of the situation that confronts the participants in communication, and about the best plans for action in that situation. When individuals engage in this kind of communicative action, there are three types of speech acts involved: constative, regulative, and expressive speech acts. Every speech act, regardless of type, is related to three sorts of validity claims, which can be accepted or rejected by the hearer. Thus, the hearer can reject a speech act for not being right with respect to norms (for example, an order can be unacceptable in a certain context), for not being truthful (when there is doubt about the intentions of the speaker), or for not being acceptable with respect to truth (for example, when the speaker assumes certain conditions to be fulfilled which in fact are not) (*Theorie des kommunikativen Handelns*, Habermas, 1981, I: 369–452).

Hahn, Adelaide E. (1893–1967)

J Kegl, University of Southern Maine, Portland, ME, USA

© 2006 Elsevier Ltd. All rights reserved.

E. Adelaide Hahn's life (1893–1967) spanned that period in the history of linguistics when diachronic studies of language change gave way to synchronic structural studies of linguistic variation. It was also the beginning of the period in which structural linguistics gave way to generative linguistics. She was criticized at one point for being "behind the times" (obituary, Lane, 1967) because of her diachronic, as opposed to structural, approach to the study of classical languages in her 1953 book, *Subjunctive and optative: their origin as futures*. In reality, she proved to be quite ahead of the times throughout her long, prolific, and illustrious career, incorporating linguistic inquiry into her study of the classics, opening many doors that had previously remained closed to women in her field, and founding a groundbreaking undergraduate specialization in linguistics at Hunter College (also in 1953). Hahn was among the first group of women admitted to the New York Oriental Club in 1940. She went on to be the first woman to hold office in that organization when she was elected as vice president in 1952. She herself recognized the significance of being the first woman to hold office in the organization's 110-year existence. Also a charter member of the Linguistic Society of America, Hahn was the first woman to serve on its executive committee (1930, 1934) and be elected as its vice president in 1940, and as its first female president in 1946. In 1951, she held the prestigious Hermann and Clara H. Collitz professorship at the LSA Linguistics Institute held in Berkeley, California.

Hahn was an active participant in the Linguistic Society of America, presenting at almost every annual meeting and teaching (and learning) at nearly every Linguistics Institute held by that organization. Those who attended these events remember not only her incomparable linguistic and classical expertise, but also her outgoing personality and her trademark hats; she came to every event with a trunk full of hats for every occasion.

Hahn will always be inextricably tied to Hunter College in New York. After being home-schooled until the age of 13 by her mother, who was a Hunter graduate, Hahn entered Hunter College High School. After graduating, she went on to major in both Latin and Greek at Hunter College in 1915 and gained a master's degree in classics from Columbia University in 1917. She subsequently began teaching French at Hunter College. In 1921, she took an appointment there teaching Latin and Greek and eventually completed her dissertation at Columbia in 1929, *Coordinate and non-coordinate elements in Virgil*. Hahn remained at Hunter until her death in 1967. Her final book, *Naming constructions in some Indo-European languages*, was published posthumously in 1969.

Hahn was also a pioneer in bringing linguistics and the classics to the attention of lay audiences. She started by regularly publishing notes in the *Classical Weekly* and later moved on to writing regular letters to the editor in a number of popular New York newspapers, bringing classics to the forefront by showing allusions to classical literature in the modern writings of the day. She pre-figured the 'linguist's column' we now see carried on by individuals such as William Safire. It's impossible to think of this major figure and outstanding personality as 'old-fashioned.'

Haiti: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

Haiti occupies the western part of the island of Hispaniola, which was discovered by Christopher Columbus in 1492 and immediately claimed by him for the Spanish crown. The native Arawak Amerindians, who had given the name to the island ('*aiti* means 'mountainous'), were virtually wiped out within 25 years of Spanish occupation. French presence on the island grew from the beginning of the 17th century and in 1697 the Spanish ceded the western third of Hispaniola to the French. Haiti became one of the richest colonial possessions in the world; the staggering wealth generated by the colony was due in great part to the importation of African slaves. Guided by Toussaint L'Ouverture, the slaves rebelled in 1793 and defeated the French, gaining independence for the country in 1804. Continued political unrest, often plagued by violence, has turned Haiti into the poorest country in the western hemisphere, with 80% of the 7 656 166 inhabitants (July 2004) living in abject poverty.

The official languages of Haiti are French and Haitian Creole French. Literacy rates are between 23% and 33%. Haitian Creole French shows the influence of three West African languages: Wolof, Fon (Fon-Gbe) and Éwé. It is the mother tongue of the entire population, but there is bilingualism in French. In 1961, Haitian Creole French was granted legal and educational status, which has resulted in a growing literature in the language; despite this, it is still perceived as having a lower social status than standard French. The 67 radio and two television stations also broadcast in Haitian Creole French. Used as a second language only, Haitian Vodoun Culture Language, also called Langay or Langaj, is employed in religious rites, songs, and dances and it includes some Haitian Creole French words, as well as others which may have African or American Indian influence.

Hale, Kenneth L. (1934–2001)

J Kegl, University of Southern Maine, Portland, ME, USA

© 2006 Elsevier Ltd. All rights reserved.

Born in Evanston, Illinois, he moved at age six to the family ranch in Arizona, where his first brush with language diversity began: as a student at the Verde Valley School in Sedona, Arizona, he got to know his roommates by getting to know their languages – first Hopi, then Jemez. At Tucson High School he learned Navajo, Tohono O'odam, Pachuco, Polish and any other language that came his way. At a time when educators were cautioning immigrant parents not to raise their children bilingual because it might hinder their acquisition of English, Hale was proving that he learned faster by working on more than one language at a time. Time and decades of research have proven him right.

For Hale, the study of language and culture always went hand in hand. He combined the study of anthropology and native American languages at the University of Arizona and received his B.A. in 1955. But he was also a full participant in the culture around him, spending his weekends bull-riding at 'jackpot' rodeos. In his senior year he won the bull-riding event at the University of Arizona rodeo and proudly wore the trophy belt buckle for the rest of his life.

Hale attended graduate school in linguistics at Indiana University, at the time a leading center in the study of native American languages. He studied under Charles Voegelin and received his M.A. in 1956 ('Class II prefixes in Navajo') and Ph.D. in 1959 ('A Papago grammar'). He taught at the University of Illinois and the University of Arizona before moving to the linguistics department at the Massachusetts Institute of Technology (1967–1999), where he combined cutting-edge theory with elegant field work.

Haitian Creole French shows the influence of three West African languages: Wolof, Fon (Fon-Gbe) and Éwé. It is the mother tongue of the entire population, but there is bilingualism in French. In 1961, Haitian Creole French was granted legal and educational status, which has resulted in a growing literature in the language; despite this, it is still perceived as having a lower social status than standard French. The 67 radio and two television stations also broadcast in Haitian Creole French. Used as a second language only, Haitian Vodoun Culture Language, also called Langay or Langaj, is employed in religious rites, songs, and dances and it includes some Haitian Creole French words, as well as others which may have African or American Indian influence.

Hale, Kenneth L. (1934–2001)

J Kegl, University of Southern Maine, Portland, ME, USA

© 2006 Elsevier Ltd. All rights reserved.

Born in Evanston, Illinois, he moved at age six to the family ranch in Arizona, where his first brush with language diversity began: as a student at the Verde Valley School in Sedona, Arizona, he got to know his roommates by getting to know their languages – first Hopi, then Jemez. At Tucson High School he learned Navajo, Tohono O'odam, Pachuco, Polish and any other language that came his way. At a time when educators were cautioning immigrant parents not to raise their children bilingual because it might hinder their acquisition of English, Hale was proving that he learned faster by working on more than one language at a time. Time and decades of research have proven him right.

For Hale, the study of language and culture always went hand in hand. He combined the study of anthropology and native American languages at the University of Arizona and received his B.A. in 1955. But he was also a full participant in the culture around him, spending his weekends bull-riding at 'jackpot' rodeos. In his senior year he won the bull-riding event at the University of Arizona rodeo and proudly wore the trophy belt buckle for the rest of his life.

Hale attended graduate school in linguistics at Indiana University, at the time a leading center in the study of native American languages. He studied under Charles Voegelin and received his M.A. in 1956 ('Class II prefixes in Navajo') and Ph.D. in 1959 ('A Papago grammar'). He taught at the University of Illinois and the University of Arizona before moving to the linguistics department at the Massachusetts Institute of Technology (1967–1999), where he combined cutting-edge theory with elegant field work.

Hale continued to research Native American languages throughout his life, including not only languages of the Southwest, but also those as distant as Aleut, Penobscot, and the Misumalpan languages of Nicaragua. His language studies in Nicaragua defined the field of language research there. His most recent work on Ulwa (formerly called Southern Sumu) produced not only a dictionary and grammar sketch, but also established its status as a language independent from Mayagna (Sumu).

At every research site, Hale inspired and left behind specialists, where possible, native-speaking linguists to carry on the work. At MIT he set up the first program to train native speakers to become linguists. Hale single-handedly revolutionized the study of Native American languages by swelling the ranks of leading researchers with more than 25 native speakers who could mine the intricacies of their language in a way no others could. Bookshelves are not filled with dusty volumes disseminating Ken Hale's works, rather the field is infused with the linguists he has produced and the data he has so carefully left behind for us to continue to mine.

In addition to his status as a leading scholar in the study of native American languages in the United States and Central America, Hale is best known for his groundbreaking work on the historical reconstruction of Australian aboriginal languages. His conviction that the more languages you know the easier it is to know them allowed him to piece together complex evidence from disparate languages, revealing their genetic relation to one another. This evidence was obscured by phenomena such as the widespread deletion of initial syllables and an ever-changing lexical landscape resulting from taboo word avoidance, but a broad-based perspective on variation and an in-depth view of the cultures involved allowed the relevant patterns to emerge.

In the 1980s Hale spearheaded the Warlpiri Dictionary Project, designed to build a monolingual dictionary of Warlpiri for native speakers. His innovative lexicographic methods were narrative based, where the use of a given lexical item in context by a native speaker would trigger investigation into its meaning, grammar, and usage. The narrative elicited in that endeavor would present the next set of lexical items for study, and so on. For Hale, the lexicon was just one anchor point for delving into a more comprehensive consideration of all aspects of the language and culture.

Hale mentored almost every major figure currently investigating the aboriginal languages of Australia. His mark on this field is foundational and unmistakable. Since his first National Science Foundation–funded trip to Australia in 1959, Hale canvassed the country writing grammar sketches of over a hundred languages and conducting intensive grammar investigations into many more, including Arrente, Warlpiri, Lardil, Ngarluma, Kunwinyku, Mara, Garrwa, various Wik dialects and and Djabugay. Many of these languages, as was the case for Linngithigh, were endangered. The last native speakers passed their treasured knowledge on to Hale, who learned and documented them. The Institute for Aboriginal Studies in Canberra currently houses and maintains his legacy of work on these languages. Many languages (American and Australian) became extinct on October 8, 2001 when Hale took his last breath.

Hale saw the genius in every language, worked to preserve endangered languages, and always placed a priority on serving the mandate of the communities he studied. Many of the languages Hale studied can trace the development of their writing systems as well as literacy programs back to his initial influence.

In 1981 Hale was appointed the Ferrari P. Ward Professor of Linguistics at MIT. He was elected to the American Academy of Arts and Sciences in 1989 and to the National Academy of Sciences in 1990. He was elected President of the Linguistic Society of America for the years 1994–95. Numerous *Festschriften* have been compiled in his honor. His publications number over 160 scholarly articles, one book published after his death, and several edited volumes.

Hall, Robert A., Jr. (1911–1987)

M Danesi, University of Toronto, Toronto, ON, Canada

© 2006 Elsevier Ltd. All rights reserved.

Robert A. Hall was a leading figure in American structuralism. His work on the reconstruction of Proto- Romance (Hall, 1950, 1976, 1984), on the nature and use of pidgins and creoles (Hall, 1966), and his defense of the American structuralism (Hall, 1987a, 1990), constitute, arguably, his most important achievements. He was also well known among students and colleagues as a mordant critic of generative linguistics (1987b). Hall also published several widely read and utilized textbooks from 1948 to 1968 (Hall, 1948, 1960, 1964, 1968) in which he explained the main concepts and techniques of American structuralism to a broad audience. He also wrote extensively on the Italian language, literary criticism, and foreign language teaching (a bibliography of his published works can be found in Danesi, 1987).

Hall was born on April 4, 1911, in Raleigh, North Carolina. He graduated with a B.A. from Princeton University in 1932. He received his A.M. from the University of Chicago the year after, and a Doctor of Letters from the University of Rome in 1934. At Princeton he majored in French and German literature. He was introduced to linguistics by Harry Hoijer while in graduate school at the University of Chicago. Hoijer's lectures, which were based on Edward Sapir's (1884–1939) textbook *Language* (1921), convinced Hall to change his area of specialization from literary criticism to linguistics. While at Chicago, he also took a course on the history of the French language with T. Atkinson Jenkins. Jenkins's focus on the role of etymology in the formal study of language fostered in Hall an abiding interest in historical linguistics and, especially, in the theory of linguistic reconstruction. This led him in the early 1950s to undertake extensive work on Proto-Romance.

From 1937 to 1946 Hall held teaching positions at the University of Puerto Rico, Princeton University, and Brown University. From 1946 to his retirement in 1977 he taught linguistics and Italian at Cornell University. At Cornell he developed a close personal and professional relationship with Charles F. Hockett (1914–2000).

As a summer lecturer at the Linguistic Institutes of Indiana University and the University of Michigan, he became a leading figure in the teaching of linguistics across the United States. It was at the 1938 Linguistic Institute that he became fascinated by Leonard Bloomfield's (1887–1949) ideas on applying linguistic ideas to language teaching, although he apparently argued with Bloomfield over the teaching of grammar to school-age children (Danesi, 1987: 55). During World War II Hall was put in charge of the U.S. Army's Italian courses at Yale University and the U.S. Navy's Pidgin English courses at Columbia, both of which were a consequence of his growing reputation as a researcher in applied linguistics and language teaching methodology. At various times in his career, Hall held executive positions in the Linguistic Society of America, the American Association of Teachers of Italian, the Wodehouse Society, and the Linguistic Association of Canada and the United States.

Throughout his academic career, Hall emphasized the need to be wary of turning linguistics into a formal discipline akin to mathematics and formal logic. Like other structuralists, he argued that any theoretical paradigm should be based on the painstaking collection and analysis of real data, not the idealizations of linguists themselves. He thus became an acerbic critic of generative linguistics and, especially, of Noam Chomsky's (b. 1928) anti-structuralist claim that an understanding of language as a universal faculty could be attained by studying syntactic rules as general principles of language design. Chomsky saw the efforts of American structuralists as well-meaning, but ultimately useless, because they revolved around making inventories of the isolated facts of language.

Chomsky's proposal became attractive in the early 1960s, since it gave eloquent expression to the age-old belief in Western philosophy that the rules of grammar corresponded to universal mental forms. Hall challenged the Chomskyan paradigm throughout the latter part of his career (Hall, 1987a, 1987b), arguing that abstract syntactic principles do not explain the semantic richness of languages, nor do they explain why languages change. As Bloomfield and Sapir before him had shown, in all sentences, the meaning of the constituent words, their relation to each other, and the forms they assume all affect syntax. This is not to imply that Hall denied the importance of studying universals in language structure. In one of his last works (1987b) he raised important questions about language: Are there general principles that underlie the grammatical rules of languages? Do these mirror historical and social processes? Do speakers of isolating languages perceive the role of sentence formation differently from speakers of agglutinating languages? Due in part to the efforts and persuasive counterarguments put forward by

Hall and other neo-Bloomfieldians, contemporary linguistic theory and methodology have, since Hall's death, become more eclectic and less partisan to one school of thought or the other than they ever were at any time in recent history.

Hall became a leading figure in the debate, in large part because of his engaging writing style, which was always lucid, terse, witty, and often tongue-in-cheek. His mastery of language could be seen saliently in his more popular writings. At times, his deeply-rooted joviality rose to the surface in amusing ways, as when he assumed the pseudonym of 'Berto Sala' for two of his fiction works (Hall, 1959, 1981). This was the Italian calque of his name (*Berto* = Robert, Sala = *Hall*).

Perhaps Hall's greatest contribution to the profession of linguistics was his popularizing of linguistic science to a broad audience of general readers with two early books, *Leave your language alone!* (1948) and *Linguistics and your language* (1960). At the time 'linguists' were viewed by people to be 'speakers of different languages' and commonly confused with 'polyglots.' Hall's books went a long way toward dispelling that confusion and establishing linguistics as a 'science of language' within the popular imagination. Hall's overall view of linguistics can be best summed up in a phrase he wrote in the former book: "The contribution of linguistics is simply part of the effort of all science in modern democratic society to find out the truth and to act upon it" (Hall, 1948: 249). Hall passed away on December 2, 1997.

Halle, Morris (b. 1923)

F Katada, Waseda University, Tokyo, Japan

© 2006 Elsevier Ltd. All rights reserved.

Morris Halle, the initiator of and chief driving force of Generative Phonology, was born July 23, 1923, in Latvia. In 1940, he immigrated to the United States and studied engineering at the City College of New York (1941–1943), then served in the U.S. Army (1943–1946). He sought an M.A. degree in linguistics at the University of Chicago (1946–1948), then went to Columbia University to study with Roman Jakobson (1948–1949), and subsequently followed Jakobson to Harvard, from which he received a Ph.D. in linguistics (1955). During his student years, Halle worked for electronic acoustic projects at the MIT Research Laboratory and was hired in 1951 by the Language Department, primarily to teach German and Russian. In 1961, Noam Chomsky and Halle initiated a Ph.D. program in linguistics at MIT, which has trained many outstanding linguists. Halle was President of the Linguistic Society of America (1974). He retired from teaching at MIT in 1996; he is currently Professor of Linguistics, Emeritus.

Halle's decisive contribution, as the leading figure in the shift away from behavioristic structuralist phonology to mentalistic generative phonology, is traced back to his work on Russian voicing assimilation in the late 1950s. He advanced a syllogistic argument against the then dominant American structuralist phonology, maintaining that their biuniqueness requirement between phones and phonemes, and hence their notion of phonemes as minimal units of surface

Morris Halle, the initiator of and chief driving force of Generative Phonology, was born July 23, 1923, in Latvia. In 1940, he immigrated to the United States and studied engineering at the City College of New York (1941–1943), then served in the U.S. Army (1943–1946). He sought an M.A. degree in linguistics at the University of Chicago (1946–1948), then went to Columbia University to study with Roman Jakobson (1948–1949), and subsequently followed Jakobson to Harvard, from which he received a Ph.D. in linguistics (1955). During his student years, Halle worked for electronic acoustic projects at the MIT Research Laboratory and was hired in 1951 by the Language Department, primarily to teach German and Russian. In 1961, Noam Chomsky and Halle initiated a Ph.D. program in linguistics at MIT, which has trained many outstanding linguists. Halle was President of the Linguistic Society of America (1974). He retired from teaching at MIT in 1996; he is currently Professor of Linguistics, Emeritus.

Halle's decisive contribution, as the leading figure in the shift away from behavioristic structuralist phonology to mentalistic generative phonology, is traced back to his work on Russian voicing assimilation in the late 1950s. He advanced a syllogistic argument against the then dominant American structuralist phonology, maintaining that their biuniqueness requirement between phones and phonemes, and hence their notion of phonemes as minimal units of surface

contrast, was untenable. He thus suppressed the external orientation of phonemes, expressed the phonetic output in terms of features, and linked the morphophonemic level directly to the phonetic output by the internal orientation of 'rules.' With this work as an onset, a decade later, generative phonology emerged in its earliest form, set forth by Chomsky and Halle (1968).

Throughout the evolution of generative phonology, Halle's work, ranging from the acoustic and articulatory properties of speech to the theoretical bases of the field, has concerned phonetic universals in line with features, the nature of rules, and the prosodic structures underlying stress and accent. The results of his theoretical studies have been illustrated and defended in detailed accounts of appropriate phonological aspects of individual languages, most notably of English and Russian, and Proto-Indo-European. The work of his students, who themselves have been movers of the field, underscores Halle's contribution as an influential educator. The development of the theory of distributed morphology and the elucidation of the nature of metrical verse also owe much to Halle's lasting contribution.

Halliday, Michael A. K. (b. 1925)

M Cummings, York University, Toronto, Canada

© 2006 Elsevier Ltd. All rights reserved.

M. A. K. Halliday was born in Leeds, UK. His father was Wilfrid J. Halliday, a teacher of English and Latin at Pudsey Grammar School and co-editor of the northern counties volume of the *Survey of English dialects* (1962). He was educated at Rugby School (1938–1942), then studied Chinese, as part of his military service, at the School of Oriental and African Studies (SOAS), University of London (1942–1943). After enlisting with the British Army in 1944, he worked with Military Intelligence in India, then returned to SOAS in 1945 as an instructor in Chinese in the military service courses. In 1947 he enrolled in the University of Peking and also taught English there; in 1948 he took his external London B.A. in Chinese. His postgraduate work for the University of London started at Peking University and continued at Lingnan University (Canton). But after his return to London in 1950, he transferred to Cambridge University, where he undertook a dissertation on the 14th-century Mandarin 'Secret History of the Mongols' under the supervision of J. R. Firth of the University of London. He became Assistant Lecturer in the Department of Chinese at Cambridge (1954) and received his Ph.D. in 1955. In 1958 he gave up his Cambridge position to take the post of Lecturer in the Department of English Language and General Linguistics, University of Edinburgh, and became Reader there in 1960. This period saw the development of his 'scale-and-category grammar,' whose principles are set out in his 1961 publication. In 1963 he moved to University College, London, as Director of the Communication Research Centre. There he was subsequently appointed Professor and founding Chair of the Department of General Linguistics (1965) and Director of the Nuffield/Schools Council Programme in Linguistics and English Teaching (1964–1970). In the latter period, the scale-and-category grammar gave way to its successor, 'systemic-functional grammar.' Halliday resigned his chair in 1971, and until 1975 undertook temporary positions at various

In 1958 he gave up his Cambridge position to take the post of Lecturer in the Department of English Language and General Linguistics, University of Edinburgh, and became Reader there in 1960. This period saw the development of his 'scale-and-category grammar,' whose principles are set out in his 1961 publication. In 1963 he moved to University College, London, as Director of the Communication Research Centre. There he was subsequently appointed Professor and founding Chair of the Department of General Linguistics (1965) and Director of the Nuffield/Schools Council Programme in Linguistics and English Teaching (1964–1970). In the latter period, the scale-and-category grammar gave way to its successor, 'systemic-functional grammar.' Halliday resigned his chair in 1971, and until 1975 undertook temporary positions at various

universities (Brown, Nairobi, Illinois, Essex) and at the Center for Advanced Study in the Behavioral Sciences (Stanford). In 1976 he took up the position of Professor and founding Chair in the Department of Linguistics at the University of Sydney, NSW, where he remained until retirement in 1988. Subsequently he has held temporary positions at universities in Singapore, China, Japan, and the UK. He has received honorary degrees from universities in Australia, Canada, China, France, Great Britain, Greece, and India. He continues to reside in the Sydney area.

The scale-and-category grammar had its origins in the work of J. R. Firth, particularly his 'system-structure' theory. Halliday's scale-and-category model had a division of language into three strata: the intermediate level of grammar and lexis (together, 'form'); the upper level of context, which relates form to the situations of its use; and the lower level of substance in which language is encoded as sounds or written symbols. The grammar has four primary categories: unit, structure, class, and system. The units of inclusiveness—sentence, clause, group, word, and morpheme—are arranged on a scale of rank, on the principle that each higher unit includes one or more instances of the next lower unit. Each unit has its own distinctive structure potential, consisting of an inventory of structural elements. Each structural element is realized by a unit at the next lower rank, unless a 'rank shift' occurs: when the element consists of some unit at the same rank as, or higher rank than, its own unit. Particular units are also classified on the basis of their syntax (distribution in the next higher unit) and morphology (their distinctive structure potential). Classes and sub-classes are arranged on a scale of delicacy, from the most general classes to the most specific. System represents the paradigmatic relationship within sets of features at increasing degrees of delicacy. The scale of exponence arranges structural elements and the units they consist of successively in top-to-bottom description.

Systemic-functional grammar is a natural development of scale-and-category grammar. Whereas in scale-and-category system is one of four primary categories, in the later development it is the sole primary category. System represents paradigmatic choice at all levels and at all ranks. Choice in one system may imply a further systematic choice of terms; the logical dependency of one system on another is a network, which in principle is elaborated synoptically to comprise in a single network all paradigmatic choices at each stratum of a single language. The relation between the paradigmatic and the syntagmatic components of the grammar is handled by realization rules, which take as input combinations of choices within the network and produce strings of structural elements as output within units at whatever rank.

Function in systemic-functional grammar is understood in two senses. The primary or 'meta'-functions divide the general meaning of discourse into three parts: ideational meaning, itself split into experiential meaning (i.e., propositional) and logical meaning, then interpersonal, and finally textual. These functional divisions permeate the grammar from top to bottom. Any whole utterance or any single form may have propositional content and logical structuring and also implications for social intercourse, and at the same time possess important text-forming features. The second meaning of function is as a term for the elements of structure within units, e.g., subject within clause, or modifier within group.

Systemic-functional grammar has been extended into a number of other important language-related disciplines, such as clinical research and practice, discourse studies, educational theory, and natural language computation. Within the latter it has led to the development of the Nigel grammar component of the Penman text generation system.

Hamann, Johann Georg (1730–1788)

G Moretti, 'L'Orientale' University, Rome, Italy

© 2006 Elsevier Ltd. All rights reserved.

Johann Georg Hamann's contribution to the European and German period best known as *Sturm und Drang* was of significant importance. Hamann had a personal relationship with Kant (*see* **Kant, Immanuel (1724–1804)**), Herder (*see* **Herder, Johann Gottfried (1744–1803)**), and Jacobi, and his influence was also felt by Goethe and Schelling. Hegel and Kierkegaard were among those who later read and studied his works.

Hamann worked most of his life as an employee of the Prussian Customs outside of the official academic world. This personal aspect of his life, coupled with the undisputed obscurity of his works, their intentional unsystematic structure, and the sarcasm that at times distinguishes them, could lead us to pose the legitimate question of why his contribution is so highly regarded. We seek an answer in Hamann's own writings, which scholars have been studying for some time, mostly in an attempt to free his thought from the careless allegation of 'irrationalism' that usually stifles any need for further study. Hamann's thinking, as a whole, and particularly relating to his ideas on language, becomes evident in those writings in which the author discusses both Kant's critical thought (regarding the relationship between reason, language, and human existence and as expressed in his *Kritik der reinen Vernunft*) and that of Herder (regarding the origins of language and his 1772 *Preisschrift*). Hamann's assertion, which is unwavering and constant, is that it is not possible to 'conceptually' make a distinction between reason and language, as if the qualities belonging to the former were in some way different from the actual historical interaction of the latter, and that language has a divine source as proof of the necessary, founding interdependence between the creature and the Creator.

Handling Variation in Speech and Language Processing

S King, University of Edinburgh, Edinburgh, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The companion article (*see* **Speech Technologies: Language Variation**) describes the many sources and types of variation in spoken language that affect speech technology systems. In this article, we look at how such systems handle this variation.

Why Is Variation Generally Seen As a Problem?

Most speech and language processing systems involve some sort of pattern matching, whether that is explicit in terms of rules or finite state machines, or implicit via a model, such as the hidden Markov model. These rules or models are usually tailored to some data set (for statistical models, this tailoring is called training). Variation poses two distinct problems in this case.

Firstly, variation in the training data means that the rules or model must have sufficiently broad coverage to fit all of the data, and this breadth can lead to a system in which distinctions between classes become less clear. In the case of modeling data using statistical distributions, this ambiguity means larger variances, which in turn leads to more overlap between the distributions associated with different classes. Larger variances will lead to poorer performance in classification of unseen ('test') data.

Secondly, if the test data varies with respect to the training data, those rules or models that may be a good fit to the training data will not be such a good fit to the test data; again, this imprecision leads to poorer performance in terms of accuracy.

So, it appears that variation causes serious problems for these systems: more variation will almost always lead to worse performance. How can systems deal with variation, and in particular, how can accuracy be maintained even in the face of variation?

Further Reading

These articles are suggested reading on speech technology: (*see* **Speech Technologies: Language Variation; Natural Language Processing: Overview; Speech Recognition: Statistical Methods**). The textbooks listed in the bibliography offer further reading and references back to the original research papers for each technique: Jurafsky and Martin's book (2000) is recommended as a general introduction; Holmes and Holmes's book (2001) has more detail; Huang, Acero, and Hon's book (2001) is the most comprehensive. Suggested reading on variation includes: (*see* **Variation and Language: Overview; Corpora; Accent; Dialect Atlases; Subjective and Objective Measures of Variation**).

Speech Recognition

There are three distinct approaches to handling variation in automatic speech recognition (ASR) systems. Variation can be essentially ignored, the system can try to remove it through some pre-processing step, or the statistical model can be adapted to better model

work on the dialect of the Albanian-speaking population of Vaccarizzo. This subject became the topic of his doctoral dissertation, which he completed in 1954.

Handling Variation in Speech and Language Processing

S King, University of Edinburgh, Edinburgh, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

The companion article (*see* **Speech Technologies: Language Variation**) describes the many sources and types of variation in spoken language that affect speech technology systems. In this article, we look at how such systems handle this variation.

Why Is Variation Generally Seen As a Problem?

Most speech and language processing systems involve some sort of pattern matching, whether that is explicit in terms of rules or finite state machines, or implicit via a model, such as the hidden Markov model. These rules or models are usually tailored to some data set (for statistical models, this tailoring is called training). Variation poses two distinct problems in this case.

Firstly, variation in the training data means that the rules or model must have sufficiently broad coverage to fit all of the data, and this breadth can lead to a system in which distinctions between classes become less clear. In the case of modeling data using statistical distributions, this ambiguity means larger variances, which in turn leads to more overlap between the distributions associated with different classes. Larger variances will lead to poorer performance in classification of unseen ('test') data.

Secondly, if the test data varies with respect to the training data, those rules or models that may be a good fit to the training data will not be such a good fit to the test data; again, this imprecision leads to poorer performance in terms of accuracy.

So, it appears that variation causes serious problems for these systems: more variation will almost always lead to worse performance. How can systems deal with variation, and in particular, how can accuracy be maintained even in the face of variation?

Further Reading

These articles are suggested reading on speech technology: (*see* **Speech Technologies: Language Variation; Natural Language Processing: Overview; Speech Recognition: Statistical Methods**). The textbooks listed in the bibliography offer further reading and references back to the original research papers for each technique: Jurafsky and Martin's book (2000) is recommended as a general introduction; Holmes and Holmes's book (2001) has more detail; Huang, Acero, and Hon's book (2001) is the most comprehensive. Suggested reading on variation includes: (*see* **Variation and Language: Overview; Corpora; Accent; Dialect Atlases; Subjective and Objective Measures of Variation**).

Speech Recognition

There are three distinct approaches to handling variation in automatic speech recognition (ASR) systems. Variation can be essentially ignored, the system can try to remove it through some pre-processing step, or the statistical model can be adapted to better model

the noisy data. Often, many approaches are applied in a single system (Furui, 2001: 343).

Ignoring Variation

Since the ubiquitous model for ASR, the hidden Markov model, is a statistical model (*see* **Speech Recognition: Statistical Methods**), variation in training data does not prevent use of the usual training methods, such as Baum-Welch parameter estimation.

The most common form of variation is corruption of the speech signal with additive noise or convolutional (channel) noise. A simple approach to building a recognizer that will work with noisy data is to train it on similar noisy data. For example, a recognizer for telephone-quality speech would be best trained on such speech, and not on clean speech collected in a recording studio. However, any variation in the noise between training and test data will lead to a significant degradation in accuracy; in situations where the type of noise varies (e.g., recognition of mobile telephone speech), such an approach will not be successful. Because noisy speech data is difficult to collect, it is often artificially constructed by adding noise to clean speech, and/or passing the speech down a real or simulated telephone line.

When the type of noise is not known in advance, the system may be trained on a data set consisting of sub-sets, each of which contains a different type of noise. The resulting system will be more robust to previously unseen noise types.

Of course, there are other types of variation than additive or convolutional noise. Variations within and between speakers, between differing microphones, and in the type of speech (e.g., read text versus spontaneous conversation) also present challenges. It is possible to ignore all of these and simply train the system on data that matches the test data as closely as possible. However, when this training is impractical or impossible, such as when the variation changes over time, other techniques must be employed.

Removing Variation from the Signal

For speech transmission systems, like telephone networks, noise must be removed from the speech signal to improve intelligibility for the listener. However, in ASR it is not necessary to produce a clean speech waveform, only a parameterization of the signal, such as a sequence of cepstral vectors (*see* **Speech Recognition: Statistical Methods**). Therefore, techniques can be applied during or after parameterization of the waveform.

- **Cepstral mean subtraction** After parameterization, normalization is commonly applied. Even simple forms of normalization such as cepstral mean normalization, in which the long-term average of the cepstral vectors is subtracted from the cepstral vector for each frame, can be highly effective for removing channel variation and some speaker variation (Furui, 2001: 341).
- **Vocal tract length normalization (VTLN)** A difference in vocal tract length, such as between males and females, causes a shift in the formant space. A simple way of compensating for this disparity is to apply a speaker-specific frequency warping during parameterization. The warping factor can be estimated automatically from a small sample of speech.
- **Echo canceling and dereverberation** In telephony, signals are reflected back from the receiver along the telephone line, causing echos that impair intelligibility. Automatic echo cancellation is employed to remove these signals. Similar techniques may be applied before ASR. Echos also occur when speech waves are reflected off surfaces prior to being recorded by the microphone. The delay time between direct and reflected versions of the speech arriving at the microphone is much shorter than the echoes in telephony. This *reverberation* causes serious problems for ASR systems.
- **RASTA filtering** During parameterization, filtering can be applied. In RASTA filtering, bandpass filters are applied to remove both very slow and very rapid variations in the parameters, because these variations cannot be attributed to the speech signal (Hermansky and Morgan, 1994).

Adapting Hidden Markov Models

It is common for a system to have a large, well-trained set of hidden Markov models (HMMs) but be faced with test data that does not match the models well enough to enable high-accuracy recognition. There may be either speaker or noise mismatch. One approach taken in this type of situation is to adapt the models to the test data. This solution requires some adaptation data, for which we may or may not know the correct word sequence. To use methods that require a known word sequence in situations where this information is not available, an initial recognition pass can be used to give a noisy (errorful) estimate of the word sequence.

- **Maximum *a posteriori* (MAP)** Given some data with a known word sequence, the HMM parameters can be adjusted to maximize the likelihood of the new parameter values, given the adaptation data. This method can only adapt the parameters of the HMMs involved in modeling

the particular word sequence of the adaptation data – which will generally be a very small subset of all the system's parameters. Therefore, this method tends to be very slow.

- **Maximum likelihood linear regression (MLLR)** With only a limited amount of data, it is not feasible to retrain all parameters of a large set of HMMs. MAP adaptation only adjusts the parameters of those models corresponding to the adaptation data; in contrast, MLLR applies a transformation to all the parameters of the entire system at once. This transform is linear, and there may be either a single global transform matrix or a number of transforms applied to different classes of models. The transform can be learned from only small amounts of adaptation data.
- **Parallel model combination** This technique is only useful for adapting to noise, rather than speaker variation. If a model is available for the noise alone, it may be combined with a model for clean speech to produce a model of noisy speech. To obtain the model of noise at recognition time, it is necessary to locate parts of the signal without speech and use them to train the model. When the speech level relative to the noise (signal-to-noise ratio, SNR) is low, this technique is not trivial to do automatically.

Adapting the Language Model

Language models for ASR are usually N-gram models (*see* **Language Processing: Statistical Methods**) trained on very large amounts of data (e.g., 100 million words). Since there is no speech corpus sufficiently large, these models are invariably trained on text corpora, which usually means either newspaper text or text drawn from the World Wide Web. This text data will differ from transcriptions of speech, so some form of adaptation may be applied to make the models a better match for spoken language.

- **Pooling training data** One simple technique is to pool large amounts of text data with small amounts of speech transcriptions. When computing the N-gram counts, the speech data is usually more heavily weighted to compensate for the small quantity available.
- **Language model interpolation** An alternative to pooling data is to train two language models, one on each type of data, then interpolate the probabilities predicted by each model. The interpolation weights can be set to maximize the probability of some held-out data not used during training.
- **Cache-based adaptation** Within a single passage of speech, certain words will be temporarily much more likely than was observed in the training data. Cache-based models exploit this: words seen so far (in the recognizer output) are stored in a cache and used to train a low-order language model (a bigram or unigram). The probabilities predicted by this cache model are then interpolated with those from a general model.
- **Topic adaptation** Adaptation can also help in situations where the speech to be recognized changes topic from time to time, such as in broadcast news, causing sudden changes in the probabilities of some words. For example, as the topic shifts from sports results to the stock market, the probabilities of football players' names will decrease and the probabilities of company names will increase. To adapt to a given topic, we need some more data from this topic to train the language model. Information retrieval (*see* **Document Retrieval, Automatic**) techniques can be used to find this data.

Preventing Variation at the Source

It is sometimes simpler and more effective to prevent variation at the source, rather than attempt to remove it later.

- **Choice of microphone** Close-talking microphones produce a much better signal-to-noise ratio than lapel or desk-mounted ones. Directional or noise canceling microphones are designed to be much more sensitive to signals coming from a single direction (the speaker) than to ones coming from other directions (background noise) (Huang, Acero and Hon, 2001; Sect. 10.2).
- **Microphone arrays** In some situations, the use of multiple microphones can help reduce the amount of noise captured by the system (Huang *et al.*, 2001: section 10.4). Microphone arrays consist of two or more microphones spaced some distance apart. Just as humans use binaural hearing to localize sounds, a microphone array uses the arrival time difference of a signal between the various microphones to localize sounds. By 'beamforming,' the array can accept signals from just one direction and reject signals from other directions. Microphone arrays can also help remove reverberation by beamforming towards only the direct-path speech signal.
- **Dialogue design** In practical dialogue systems deployed today, the machine always has the initiative. This initiative allows the system designers to manipulate the dialogue in order to dramatically reduce the difficulty of the ASR task. For example, while a human telephone banking teller may ask the customer "How may I help you?", an automated system may ask "What sort of transaction would you like to make?". By effectively limiting the

range of possible answers, the system is able to impose a much more restrictive language model during ASR, and hence achieve a lower error rate. The language model will be switched at each turn in the dialogue.

Speech Synthesis

- **System architecture** By carefully structuring the architecture of a text-to-speech (TTS) (*see* **Speech Synthesis**) system, it is possible to partition the linguistic resources required by the various modules such that maximal re-use can be achieved. For example: the statistical models and/or rules used for expanding abbreviations may be shared across all accents of a language; the phoneme inventory may be shared across all speakers of a particular accent.
- **Pronunciation dictionary** Writing pronunciation dictionaries for tens of thousands of words by hand is extremely time-consuming and therefore expensive. It also takes a great deal of expert knowledge and, because consistency is important, cannot usually be distributed to a large team of people. However, a close match between the speaker and the pronunciation dictionary is crucial. To resolve this conflict, a method has been developed to generate accent- or speaker-specific dictionaries from a single language-specific but accent-independent 'meta-dictionary' using a relatively small set of rules and settings (Fitt & Isard, 1999).
- **Pitch marking** Most concatenative speech synthesis systems (*see* **Speech Synthesis**) require accurate pitch marking of the speech waveforms in the inventory. It is difficult to construct an automatic pitch marking algorithm that works "out of the box" for all speakers. Usually, some parameters, like the minimum and maximum expected pitch period durations, must be tuned to the individual speaker.

Other Speech Technologies

While variation is almost always a problem for ASR, sometimes variation between speakers is actually very useful.

- **Speaker identification** Identifying who is talking is a useful task in its own right (*see* **Speaker Recognition and Verification, Automatic**). The obvious application is security, e.g., telephone banking, building access control. Two distinct tasks can be identified: speaker identification ("Which one of a set of speakers is talking?") and speaker verification ("Is the speaker who they claim to be?"). Somewhat surprisingly, the parameterization of speech used for speaker-independent ASR is often the most effective one for speaker identification or verification, and similar statistical models are used (HMMs). However, discriminative training techniques (*see* **Speech Recognition: Statistical Methods**) are usually required to get high accuracy.
- **Speaker tracking** In multi-party speech, such as in a business meeting, we may wish to simultaneously recognize the speech of all speakers and annotate the resulting output with speaker identity. Since speakers overlap a great deal, we must use the different characteristics of each individual speaker (e.g., F0) to do this (possibly in combination with speaker location information obtained from a microphone array).
- **Speaker characteristic identification** Rather than the actual identity of the speaker, we may only be interested in certain characteristics. For example, a system may try to guess the gender of a speaker, and then use gender-specific models for recognition. Since most ASR systems are language-specific, a language guesser must be employed as an initial step when multiple languages are to be recognized. Automatically determining the accent of a speaker has applications in dialectometry (*see* **Dialect Atlases**).

Conclusion

While variation, from whatever source, can cause major problems for spoken language systems, a wide range of techniques are available to minimize the degradation in performance. These include: preventing variation; removing it from speech signals; transforming parameterized speech; adjusting the parameters of the statistical models.

Handwriting Recognition, Automatic

S Srihari, State University of New York at Buffalo, Amherst, NY, USA

Handwriting is a means of recording personal information as an aid to memory, as well as a means of communication with others. A pen together with paper or a small note-pad is often more convenient than a computer keyboard. Automatic recognition of handwriting has significance in reading handwritten notes in a personal digital assistant, postal addresses on envelopes, amounts in bank checks, forms, field notes, historical records, etc. The ultimate handwriting computer will have to process handwriting in an unconstrained environment, deal with many writing styles and languages, work with arbitrary user-defined alphabets and understand any handwritten message by any writer.

Fundamental characteristics of handwriting are that it consists of artificial graphical marks on a surface; its purpose is to communicate something; and this purpose is achieved by virtue of the mark's conventional relation to language. Each script has a set of icons, which are known as characters or letters, that have certain basic shapes. There are rules for combining letters to represent shapes of higher-level linguistic units. For example, there are rules for combining the shapes of individual letters so as to form cursively written words in the Latin alphabet.

Several types of analysis, recognition and interpretation can be associated with handwriting. Handwriting recognition is to transform written language in its spatial form of graphical marks into symbolic representation. For languages based on the Latin alphabet, the basic units of this symbolic representation are characters. Due to nonseparability of cursively written characters, recognition of words may be performed holistically; however, the resulting word is represented in terms of its characters. Handwriting interpretation is to determine the meaning or implication of a body of handwriting, e.g., determining the destination bar code of a handwritten address. Handwriting recognition and interpretation are processes whose objectives are to filter out the variations so as to determine the message—which are aided by knowledge of the subject domain, e.g., in the case of the physician's prescription, where a pharmacist uses knowledge of drugs. Handwriting identification is to determine the writer of a handwritten document from among a set of known writers. Signature verification is to determine whether or not a questioned signature matches the genuine signature samples of a given person. In contrast to recognition and interpretation, identification and verification are processes that determine the special nature of the writing of a specific writer. All of the above processes depend upon features extracted from the writing, some of which are illustrated in **Figure 1**.

Handwriting Input

Handwriting data is converted to digital form either by scanning the writing on paper or by writing with a special pen on an electronic surface such as a digitizer combined with a liquid crystal display. The two approaches are distinguished as static or off-line and dynamic or on-line handwriting, respectively. In the dynamic case, the two-dimensional coordinates of successive points of the writing as a function of time are stored in order, i.e., the order of strokes made by the writer is readily available. In the static case, only the completed writing is available as an image. The dynamic case deals with a spatiotemporal representation of the input, whereas the static case involves analysis of the spatioluminance of an image. The raw data storage requirements are widely different. The data requirements for an average cursively written word are: in the dynamic case, a few hundred bytes, typically sampled at 100 samples per second, and in the static case a few hundred kilobytes, typically sampled at 300 dots per inch. Paper documents, which are an inherently analog medium, can be converted into digital form by a process of scanning and digitization. This process yields a digital image. For instance, a typical 8.5×11-in page is scanned at a

resolution of 300 dots per inch to create a gray-scale image of 8.4 Mb.

Recognition rates are reported for either character recognition given a fixed alphabet or word recognition given a fixed set of words (or lexicon). Recognition rates are much higher for the dynamic case, e.g., static word recognition rates with lexicon sizes of 10 100 and 1000 were 95%, 85%, and 78%, respectively, for the top choice, whereas the dynamic word recognition rate for a lexicon of size 21 000 was 80%.

Dynamic recognition systems are available in personal digital assistants (PDAs) and tablet PCs. The performance of PDAs is acceptable for processing hand-printed symbols, and, when combined with keyboard entry, a powerful method for data entry has been created. Static recognition systems have made a significant economic impact for constrained domains such as postal addresses and courtesy amounts on bank checks.

Dynamic Handwriting Recognition

Dynamic recognition deals with the automatic processing of a message as it is written, using a digitizer or a stylus that captures information about the pen tip, generally its position, velocity or acceleration as a function of time. The sampled data is preprocessed for noise reduction, trace normalization and segmentation into units. Noise arises due to digitizer quantization, the digitizing process, erratic hand or finger movements, inaccuracies of the pen-up/pen-down indicator, etc. Noise reduction deals with data smoothing, signal filtering, and breaking connections. Normalization accounts for baseline drift, writing slant and script size.

Segmentation is at the message and word levels. Message segmentation processes are line detection, word segmentation, separating nontextual gesture commands, etc. Words are segmented into characters and sub-character strokes. Tentative segmentation is corrected during classification. Segmentation can be avoided by holistic recognition, particularly for small vocabularies. Some methods combine holistic recognizers with segmentation-based algorithms.

A pen-based computer needs to process a handwritten message as it is produced. The steps, ranging from various shape classification processes to ultimate shape recognition, will have to cope with the variability of message production. Some sources of variability are geometric, allographic and neurobiomechanical. Geometric variations refer to position, size, baseline orientation and slant. Allographic variations deal with the various models that are associated with a single character by different populations of writers. Neurophysiological and

Figure 1 Examples of handwriting features.

biomechanical factors affect both the execution of an action plan or the production of individual strokes.

Recognition methods are either structural or statistical. Structural methods use rules to describe character shape. The rules are embellished by probabilities to capture variations of characters and words. Statistical methods represent shape by a feature list and classes by probability distributions in multidimensional feature space. Statistical methods can be grouped into generative and discriminative.

Generative methods are Bayesian methods, principal component analysis, cluster analysis, etc. Discriminative methods are exemplified by linear discriminant functions and support-vector machines. Artificial neural networks are implicitly generative. For instance, Kohonen self-organized feature maps are used to detect shape prototypes in a training set of characters – which is analogous to k-means or hierarchical clustering.

The hidden Markov model (HMM) is a doubly stochastic process that can be based on either discrete or continuous symbols. The former converts the feature vector into a discrete symbol using vector quantization. Symbol probabilities are for stroke shapes in a sliding window. The continuous approach uses variances and covariances of features to estimate the probability of the occurrence of an observed feature vector, which is usually assumed to be Gaussian. The goal of the HMM algorithm is to find the probability that a specific class is the most likely to occur given a sequence of observations. The essence of this approach is to determine the *a posteriori* probability for a class, given an observed sequence where the jump from one state to another is described by a Markov process. HMMs can be incorporated into a stochastic language model.

Cursive script recognizers do not yet take into account contextual anticipatory phenomena: for example, once handwriting is well learned, the neuromuscular effectors involved in that task normally act concurrently to speed up the execution. This generally leads to co-articulation and context effects. The sequence of strokes is not produced in a purely serial manner, i.e., one after the other, but parallel articulatory activity does occur, and there is important overlap between successive strokes or graphemes. The production of an allograph is thus affected by the surrounding allographs: it depends both on the preceding and following units. Many methods take into account the effect of the previous stroke over the actual stroke being processed but often neglect the simultaneous effect of the forthcoming stroke.

Personal adaptation can improve accuracy and usability of dynamic systems. A basic user-dependent system comes with a set of recognizable allographs for each character, but it allows the user's definition of his own set of symbols or gestures to take user preferences into account. This allows taking into account cultural determinants, handwriting learning systems as well as personal styles and evolution of handwriting habits over a long period of time.

Signature Verification

In signature verification, a test, or questioned, signature is compared with one or a few reference specimens collected from an enrolled user. It requires the extraction of writer-specific information from the signature signal, irrespective of its handwritten content.

Signature verification is based on the assumption of handwriting being singular, exclusive and personal. Signature verification presents a double challenge. The first is to verify that what has been signed corresponds to the unique characteristics of an individual, ignoring the content of the writing. Rejection of an authentic signature is a false negative. The second and more demanding task is avoiding the acceptance of a forgery as authentic, which is referred to as a false positive.

Tolerance levels for signature verification is smaller than that for handwriting recognition. Some applications may require an error of 1 in 100,000 for false negative and even less for false positive. A trade-off exists between the errors. Signature verification systems work with an error margin of about 2–5% between the two errors.

Evaluation of signature verification algorithms raises several difficulties. Theoretically, it is not possible to measure the false-positive rate, since it is not possible to define a good forger and prove existence/nonexistence of a forger. Practically, several methods have been proposed. The simplest ones rely on the use of random forgeries, i.e., picking a random true signature of a person and considering it as a forgery of the signature of another person. Many studies incorporate unskilled forgeries, and, in some rare cases, highly skilled forgeries. Definitions of random, skilled and unskilled imitations vary.

Principal verification methods are probabilistic classifiers, time warping or dynamic matching, signal correlation, neural networks, hidden Markov models, Euclidian or other distance measures, hierarchical approach combining a few methods, and Baum-Welch training. At the analysis level, the main approaches have focused on spectral analysis, cosine transforms, direction encoding, velocity, timing and shape features sets, shape features force, pressure and angles functions.

Dynamic signature verification occupies a specific niche among identification systems. On the one hand,

they differ from systems based on the possession of something (key, card, etc.) or the knowledge of something (passwords, personal information, etc.) because they rely on a specific well-learned gesture. On the other hand, they also differ from systems based on the biometric properties of an individual (fingerprints, voice print, retinal prints, etc.) because the signature is still the most socially and legally accepted means for identification. Its unique, self-initiated motoric act provides an active means to simultaneously authentify both a transaction and a transactioner.

Static Handwriting Recognition

The central tasks in off-line handwriting recognition are character recognition and word recognition. A necessary preliminary step to recognizing written language is the spatial issue of locating and registering the appropriate text when complex, two-dimensional spatial layouts are employed, a task referred to as document analysis.

Preprocessing operations performed prior to recognition are thresholding, or converting a gray-scale image into a binary black-white image; noise removal, extraction of foreground textual matter by removing, say, textured background, salt-and-pepper noise and interfering strokes; line segmentation, the separation of individual lines of text; word segmentation, the isolation of textual words; and character segmentation, the isolation of individual characters, typically those that are written discretely rather than cursively.

Thresholding is to extract the foreground (ink) from the background (paper). The histogram of gray-scale values of a document image typically consists of two peaks, a high peak corresponding to the white background and a smaller peak corresponding to the foreground. So the task of determining the threshold gray-scale value (above which the gray-scale value is assigned to white and below which it is assigned to black) is one of determining an optimal value in the valley between the two peaks. The gray-scale histogram defines the optimal threshold as one that maximizes the between-class variance, where the distributions of the foreground and background points are regarded as two classes. Each value of the threshold is tried, and one that maximizes the criterion is chosen. Improvements to this basic idea, such as handling textured backgrounds, measure attributes of the resulting foreground objects to conform to standard document types.

Stroke connectivity has to be preserved during noise removal. Digital capture of images can introduce noise from scanning devices and transmission media. Smoothing operations are used to eliminate artifacts introduced during image capture. Adaptive stroke filling with a neighborhood operator emphasizes stroke connectivity and prevents aggressive overfilling.

Interference of strokes from neighboring text lines is a problem that is often encountered. One approach is to follow strokes in thinned images to segment the interfering strokes from the signal. Thinning algorithms hold the promise of converting static handwriting to dynamic data, although artifacts such as spurs limit their use.

Segmentation into lines is more difficult than in the case of printed text. If the writing is on ruled lines, line segmentation is accomplished by examining the horizontal histogram profile at a small range of skew angles. When lines of text undulate up and down, ascenders and descenders frequently intersect characters of neighboring lines. One method is based on the notion that people write on an imaginary line that forms the core upon which each word of the line resides. This imaginary baseline is approximated by the local minima points from each component. A clustering technique is used to group minima of components to identify text lines.

Line separation is followed by a procedure to separate text into words. The focus is on identifying physical gaps assuming that gaps between words are larger than gaps between characters (Figure 2). However, exceptions are commonplace because of flourishes in writing styles with leading and trailing ligatures. Another method incorporates cues that humans use and does not rely solely on the one-dimensional distance between components. Writing style in terms of spacing is captured by characterizing the variation of spacing between adjacent characters as a function of the corresponding characters themselves. The notion of expecting greater space between characters with leading and trailing ligatures is incorporated into the segmentation scheme.

Isolation of words in a textual line is usually followed by recognizing the words themselves. Most recognition methods call for segmentation of the word into its constituent characters. Segmentation points are determined using features such as ligatures and concavities. Gaps between character segments

Figure 2 Word separation based on gaps.

(a character segment can be a character or a part of character) and heights of character segments are used in the algorithm.

Character Recognition

The basic problem is to assign the image of a handwritten character to its symbolic class. We discuss here some of the issues in the recognition of English orthography in its handwritten form. The typical classes are the upper and lower case characters, the ten digits and special symbols such as the period, exclamation mark, brackets, dollar and pound signs, etc. Shape features are extracted so as to assign the observed character to the appropriate class. Support-vector machines and artificial neural networks have emerged as fast methods for implementing classifiers. Algorithms based on nearest-neighbor methods have higher accuracy but are slower.

Recognition of a character from a single machine-printed font family on a well-printed paper document can be done very accurately. Difficulties arise when handwritten characters are to be handled. Some examples of segmented handwritten characters are shown in Figure 3. In the difficult cases, it becomes necessary to use models to constrain the choices at the character and word levels. Such models are essential in handwriting recognition because of the wide variability of handprinting and cursive script.

Word Recognition

A word recognition algorithm attempts to associate the word image to choices in a lexicon. Typically, a ranking is produced. This is done either by the analytic approach of recognizing the individual characters or by the holistic approach of dealing with the entire word image. The latter approach is useful in the case of touching printed characters and handwriting. A higher level of performance is observed by combining the results of both approaches. There exist several different approaches to word recognition using a limited vocabulary.

Figure 3 Examples of handwritten characters segmented from images.

Analytic word recognition based on determining presegmentation points followed by determining an optimal path through a state transition diagram is shown in Figure 4. In the holistic approach, the word image is represented by a fixed size vector, for example by imposing a fixed grid on the word image (Figure 5). Other holistic features are the upper and lower profiles of word images, which are represented as a series of vectors describing the global contour of the word image and bypass the segmentation phase. Word recognition involves preprocessing, a possible segmentation phase that could be avoided if global word features are used, recognition, and postprocessing. Performance of the methods is a function of the size of the lexicon.

When dealing with large lexicon sizes, performance can be improved by using a dynamic lexicon. For example, the lexicon is represented as a tree and the results of recognizing the first few characters are used to eliminate possible paths in the tree. In another method, word images are oversegmented such that after segmentation no adjacent characters remain touching. Instead of passing on combinations of segments to a generic recognizer, a lexicon is brought into play early in the process. A combination of adjacent segments is compared to only those character choices that are possible at the position in the word being considered. The approach can be viewed as a process of accounting for all the segments generated by a given lexicon entry. Lexicon entries are ordered according to the goodness of match. Dynamic programming is used to string the potential character candidates into word candidates, combine heuristics to disqualify certain groups of primitive segments from being evaluated if they are too complex to represent a single character, and take into account compatibility between consecutive character candidates.

Application of Static Handwriting Recognition

A noteworthy success of static handwriting recognition has been in reading postal addresses. The task of interpreting handwritten addresses is one of assigning a mail-piece image to a delivery address. An address for the purpose of physical mail delivery involves determining the country, state, city, post office, street, primary number (which could be a street number or a post office box), secondary number (such as an apartment or suite number) and finally the firm name or personal name.

The recognition task is considerably aided by knowledge of the postal domain. The task is one of

Figure 4 Analytic word recognition: (A) word with presegmentation points shown and (B) corresponding state transition diagram.

Figure 5 Holistic word recognition: a word is represented in an 8×4 grid and a feature vector is extracted.

interpretation rather than recognition since the goal is to assign the address to its correct destination irrespective of incomplete or contradictory information present in the writing. Systems currently in use by the United States Postal Service and other countries' postal services are able to correctly sort about 90% of handwritten addresses.

A gradation of class-discrimination problems is encountered: handwriting versus machine-print with two classes, handwritten numeral recognition with ten classes (Figure 6), alphabet recognition with 26 classes (Figure 7) and touching-digit pair recognition with 100 classes (Figure 8). Word recognition with a lexicon is a problem where the number of classes is dynamically determined by contextual constraints. Another problem encountered is similar to the problem of object recognition in computer vision: determining the destination address in a cluttered background.

Signature Verification

In static signature verification, a questioned signature image—as scanned and extracted from a bill, a check or document—is compared with known signature references. Unlike the dynamic case, there is no temporal information directly available, and the verification process relies on features extracted from the luminance of the trace only.

Although the extraction of a signature from a document background is already a very difficult problem in itself, particularly for checks, most of the studies published to date assume that an almost perfect extraction has been done. From a practical point of view, most researchers agree now that a solution will rely on the extraction from a signature of pseudodynamic features reflecting, for example, some specific characteristics used by a forensic document examiner as well as the automatic recovery of the stroke sequence in the signature image.

Handwriting Identification

Handwriting identification deals with comparing questioned writing with known writing exemplars and determining whether the questioned documents and exemplars were written by the same or different authors. Two issues of concern are the variability of handwriting within individuals, which are individual

Figure 6 Ten-class discrimination (digits). Three sets of images are shown. The top row consists of difficult-to-read numerals. The middle row consists of fairly standard ones. The bottom row has non-digits, supplied to a digit recognizer, which must be rejected.

Figure 7 State abbreviations recognition with 66 classes. The valid abbreviations are AA, AE, AK, AL, AP, AR, AS, AZ, CA, CM, CO, CT, CZ, DC, DE, FL, FM, GA, GU, HI, IA, ID, IL, IN, KS, KY, LA, MA, MD, ME, MH, MI, MN, MO, MP, MS, MT, NC, ND, NE, NH, NJ, NM, NV, NY, OH, OK, OR, PA, PR, PW, RI, SC, SD, SQ, TN, TX, TT, UT, VA, VI, VT, WA, WI, WV, WY. The figure shows image snippets containing two-letter abbreviations collected from actual mail.

Figure 8 Hundred-class discrimination (digit pairs). Touching digit pairs can be hard to separate, and it may be preferable to treat them as a single unit consisting of 100 classes. The figure shows touching-digit image pairs extracted from ZIP Codes.

characteristics, and between individuals, which are class characteristics. The extraction of distinctive individual traits is what is relied on to determine the author of the questioned document.

Information about these two classes of variability is gathered based on the features for characterizing handwriting. Some of the elements of comparison are alignment (reference lines), angles, arrangement (margins, spacing), connecting strokes (ligatures and hiatuses), curves, form (round, angular or eyed), line quality (smooth, jerky), movement, pen lifts, pick-up strokes (leading ligatures), proportion, retrace, skill, slant, spacing, spelling, straight lines and terminal strokes.

Several of these features are readily computable based on handwriting recognition techniques. For instance, handwriting recognition procedures routinely compute baseline angle and slant so that a correction can be applied prior to recognition. The result of applying these procedures is then used to cluster different samples of handwriting in a multidimensional feature space. The writership of the questioned document is then established from its proximity to the exemplars. Most handwriting identification experts today almost entirely rely on manually intensive techniques. Tools have recently become available for automated handwriting verification and identification (Figure 9).

Figure 9 Screen shots of a software system for writer verification. The total log-likelihood ratio of the two documents (A) being written by the same/different writer are accumulated by the scores provided by several handwriting features (B).

Language Analysis and Processing: Language Models

Whatever the approach for recognition, dynamic or static, language models are essential in recovering strings of words after they have been passed through a noisy channel, such as handwriting or print degradation. The most important model for written language recognition is the lexicon of words. String matching algorithms between candidate words and a lexicon are used to rank the lexicon, often using a variant of the Levenshtein distance metric that incorporates various edition costs into the ranking process. String matching methods are often improved by incorporating dictionary statistics in the training data. Lexical subsets, in turn, are determined by linguistic constraints, e.g., in recognizing running text, the lexicon for each word is constrained by the syntax, semantics and pragmatics of the sentence.

Figure 10 Handwritten sentence recognition. The path through top word choices is determined using part-of-speech tags.

The performance of a language model is evaluated in terms of the text perplexity, which measures the average number of successor words that can be predicted for each word in a text. The performance of a recognition system can thus be improved by incorporating statistical information at the word-sequence level. The performance improvement derives from selection of lower-rank words from word recognition output when the surrounding context indicates such selection makes the entire sentence more probable. Lexical techniques, such as collocational analysis, can be used to modify word neighborhoods generated by a word recognizer. Modification includes reranking, deleting or proposing new word candidates. Collocations are word patterns that occur frequently in language; intuitively, if word A is present, there is a high probability that word B also is present.

Methods to apply syntactic knowledge include N-gram word models, N-gram class (e.g., part-of-speech) models, context-free grammars and stochastic context-free grammars. N-Gram word models seek to determine the string of words that most probably gives rise to the set of output words that has been digitized or scanned. The problem with this approach is the difficulty of reliably estimating the parameters as the number of words grows in the vocabulary. A few alternatives to avoid this problem have been proposed: smoothing back-off models and maximum entropy methods. N-Gram class models map words into syntactic or semantic classes. In the first case, also referred to as the part-of-speech approach, for each sentence that has to be analyzed, a lattice of word/tag assignations is created to represent all possible sentences for the set of possible word candidates. The problem is to determine the best path through the lattice. The semantic approach relies mainly on machine-readable dictionaries and electronic corpora; it uses word definition overlaps between competing word candidates to select the correct interpretation. Other approaches that involve collocations are co-occurrence relations and the use of semantic codes that are available in some dictionaries.

So far, these approaches have been limited to proof of concept, and no large-scale experiments have been reported to demonstrate the effectiveness of semantic information in resolving ambiguities, although real-life analysis of human behavior suggests that this is very often the only way to proceed. An example of a handwritten sentence together with recognition choices produced by a word recognizer and grammatically determined correct paths is shown in Figure 10. An increase in the top-choice word-recognition rate, for example, from 80% to 95%, is possible with the use of language models.

Conclusion

Handwriting recognition has come of age from being a sleepy research area to general acceptance. In the dynamic or on-line case, handwriting recognition in personal digital assistants and tablet PCs is impressive. Dynamic signature verification systems have been marketed over the last few years. Most of the static or off-line successes have come in constrained domains, such as postal addresses, bank checks and census forms. The analysis of documents with complex layouts, recognition of degraded printed text and the recognition of running handwriting continue to remain largely in the research arena. While machine performance is beginning to become acceptable in both handwriting recognition and handwriting identification, major research challenges exist in word and line separation, segmentation of words into characters, recognition of words when lexicons are large, and the use of language models in aiding preprocessing and recognition.

It could be said that the brevity of Novalis's life was in some ways mirrored in his work, which is astonishingly condensed in its richness and intensity of ideas. In point of fact, in 1802, merely one year after the poet's premature death, Friedrich Schlegel and Ludwig Tieck had already seen to the publication of two collections of his writings. Nonetheless, it is because of the edition of these very writings that the image of Novalis as a 'fragmentary' thinker has not only emerged, but also strengthened throughout the years. Such an image has shaped, almost without exception, the way Novalis's work has been interpreted until his *Nachlass* was finally discovered and studied in 1960. The discovery led to the publication of the historical and critical analysis of his work that is still ongoing today.

Novalis's 'new' image has therefore emerged from the analysis of his critical work. It has allowed the scholars to show the intrinsic relationship that exists between Novalis 'the poet' – the author of *Heinrich von Ofterdingen*, *Lehrlinge zu Sais*, as well of *Geistliche Lieder* and the *Hymnen an die Nacht* – and Novalis 'the theorist,' who dedicated numerous fragments to the works of Kant, Hemsterhuis, and, most of all, Fichte. It was in his *Fichte Studien*, which were written in 1795–1796, at the peak of his theoretical confrontation with Friedrich Schlegel, that Novalis laid the foundations not only of his own philosophical work, but also – although less overtly – of his linguistic and poetical work, mainly through important remarks about Fichte's concept of *Wechselwirkung*.

Harmony

C Reiss, Concordia University, Montréal, QC, Canada

© 2006 Elsevier Ltd. All rights reserved.

Vowel harmony is the name applied to a range of assimilatory phenomena involving vowel features, typically in contiguous strings of syllables. The term is not a primitive element of phonological theory, but instead serves as a pretheoretical classification, much like terms such as 'passive construction' in syntax, which are now recognized to apply to a heterogeneous set of phenomena. To apply the parallel given by Chomsky (2000: 8), the term 'vowel harmony' in phonology is like the term 'terrestrial mammal' in biology: they are "taxonomic artifacts, useful for informal description perhaps but with no theoretical standing."

Phenomena that have been grouped under this informal cover term, have, however, been valuable in providing a testing ground for many aspects of phonological theory, including the following questions:

- Does phonological computation involve rules or constraints?
- How is locality computed in phonology?
- Can rules apply iteratively?
- Do vowels and consonants consist of features from the same basic set?
- How does phonology interact with morphology?

These issues will come up as some standard cases are examined in the following discussions.

The term 'vowel harmony' is sometimes applied to static generalizations about lexical items. For example, the Finnish word *tyhmä* 'stupid' has only front vowels

Hardenberg, Friedrich von (Novalis) (1772–1801)

G Moretti, 'L'Orientale' University, Naples, Italy

Harmony

C Reiss, Concordia University, Montréal, QC, Canada

© 2006 Elsevier Ltd. All rights reserved.

Vowel harmony is the name applied to a range of assimilatory phenomena involving vowel features, typically in contiguous strings of syllables. The term is not a primitive element of phonological theory, but instead serves as a pretheoretical classification, much like terms such as 'passive construction' in syntax, which are now recognized to apply to a heterogeneous set of phenomena. To apply the parallel given by Chomsky (2000: 8), the term 'vowel harmony' in phonology is like the term 'terrestrial mammal' in biology: they are "taxonomic artifacts, useful for informal description perhaps but with no theoretical standing."

Phenomena that have been grouped under this informal cover term, have, however, been valuable in providing a testing ground for many aspects of phonological theory, including the following questions:

- Does phonological computation involve rules or constraints?
- How is locality computed in phonology?
- Can rules apply iteratively?
- Do vowels and consonants consist of features from the same basic set?
- How does phonology interact with morphology?

These issues will come up as some standard cases are examined in the following discussions.

The term 'vowel harmony' is sometimes applied to static generalizations about lexical items. For example, the Finnish word *tyhmä* 'stupid' has only front vowels

(*ä* stands for [æ]), and the word *tuhma* 'naughty' has only back vowels. Like most morphologically simple words (uninflected roots) in the language, these two forms contain only front vowels or only back vowels (a class of exceptions is discussed later). Such roots are sometimes said to be 'harmonic.' This generalization about roots may or may not reflect a computational property of the synchronic grammar – this depends on theoretical perspective – and it is assumed here that such facts represent descriptive generalizations about the lexicon (reflecting historical developments) that are possibly not encoded in a speaker's knowledge of language. Thus, henceforth, the term 'vowel harmony' is reserved for synchronic alternations. For example, when the elative suffix is added to the Finnish stem *tyhmä*, the surface form is *tyhmästä*, with a front vowel in the suffix that 'harmonizes' with the vowels (or one of the vowels) of the stem. When the elative suffix is added to *tuhma*, the result is *tuhmasta*, with a back vowel in the suffix, again harmonizing with the stem. The fact that this alternation is completely productive, applying trivially to known and invented stems, and involving many suffixes, suggests that we are dealing with a phonologically triggered alternation, and not a case of memorized allomorphy.

This simple data set gives rise to a number of interesting questions: What is the underlying representation of the elative suffix? What is triggering the harmony in the suffix? A plausible answer to the first question is that the suffix is underlyingly /-sta/, and that the vowel is changed to [ä] in front contexts. It is trivial to make this work – we can write a rule system that takes elative inputs with only /-sta/ and outputs [-stä] in the appropriate contexts. Another plausible solution is that the underlying suffix is /stä/, which is changed by rule to [-sta] in back contexts. An interesting third alternative that has been considered for the Finnish data, as well as many other cases, is that the elative suffix contains a segment lacking specification for the feature [back], and that either [+ back] or [−back] is filled in by rule in the appropriate context (see Inkelas (1995) for references and discussion on underspecification). We will adopt this position and symbolize the suffix with an underspecified vowel thus: /-stA/.

Possible answers to the question of what serves as the trigger of harmony are (a) the stem-initial vowel (the one furthest from the suffix), (b) the stem-final vowel (the one closest to the suffix), and (c) both stem vowels together. As we have suggested, these three choices actually cover a variety of conditions – for example, the relevant factor in (a) could be that the vowel is stem initial, or that it is furthest from the suffix. It turns out that no version of possibility (a) is ever the appropriate generalization – neither being stem initial nor furthest from the harmonizing target. There are putative cases of bisyllabic triggers for harmony (see Walker, 2001; Dresher and Zhang, 2000), thus instantiating possibility (c), but if they exist, they can perhaps be reduced to recursive chains of single-syllable conditions. Some version of possibility (b) seems most promising – in particular, the fact that the stem-final vowel is closest to the target is typically assumed to be the crucial factor.

Note, however, that the integration of this notion of closeness into a theoretical analysis is subject to great variation. The claim that it is this closest vowel that triggers harmony does not imply that the notion of closeness is inherently part of the relevant process or constraint set. In some analyses, all vowels may be potential triggers of harmony, but the effects of nonlocal triggers are blocked due to particular constraints on representations. (It is crucial to note in this regard that the oft-cited constraint against crossing association lines is logically incoherent, as demonstrated by Coleman and Local (1991).) In another type of analysis, the target vowel 'searches' for a trigger and the search terminates when one is found. Thus the locality of the trigger is just a result of the linear nature of the search, and there is no need for locality constraints or conditions in the computation.

Consider some data for Finnish neutral vowels:

(1a)	värttinä		'spinning wheel'
(1b)	värttinä-llA-ni-hAn	[värttinällänihän]	'with spinning wheel, as you know'
(1c)	palttina		'linen cloth'
(1d)	palttina-llA-ni-hAn	[palttinallanihan]	'with linen cloth, as you know'

Forms (1a) and (1b) are not surprising – they just seem to show the application of harmony to a string of suffixes. The uninflected form (1a) has all front vowels, and the suffixes in form (1b) are all front as well. In a case such as this, the question is whether the suffix vowels are all harmonizing with the stem-final vowel, or each with its immediate predecessor. For example, where is the final vowel, in the suffix [-hän], getting its [− back] value? Interestingly, phonologists may disagree about whether the trigger is the stem-final vowel, or the vowel of the /-llA/ suffix, but they will definitely agree that it is not from the immediately preceding vowel of /-ni/. This is because the forms (1c) and (1d) show that [i] does not conform to our expectations, given what we have seen so far.

The complex forms (1b) and (1d) both contain three suffixes and show several noteworthy phenomena. First of all, vowel harmony systems may contain neutral vowels, such as the vowel of *-ni*, which does not alternate with respect to the harmonic feature,

[back] in this case. The vowel is unchanging in both [+ back] and [−back] contexts. This particular type of neutral behavior, which allows harmony of its flanking vowels for either value of [back], is called transparency, since the vowel appears to be transparent to the process. Transparency has been approached in at least two ways: attributing special properties (or lack thereof) to the transparent vowels and defining the harmony triggers in such a way as to exclude the transparent vowels. The first approach again relies on the mechanism of underspecification. We mention here that consonants sometimes interfere in, or particpate in, harmony processes, but when they do not, the assumption is that they lack the relevant features. This approach to consonant transparency is basically identical to the underspecification approach to vowel transparency – in each case, the transparent segments are assumed to lack certain features. For vowels, the assumption is that they are filled in, in the course of the derivation, so that, for example, the vowel of *-ni* is underlyingly without a value for [back], but then receives [− back] after all harmony has occurred. For consonants, the assumption is that transparent consonants never have the relevant features; they lack them underlyingly and they exit the phonology without them. The second approach to transparency recognizes the possibility for arbitrary formal stipulation in rule statements.

Setting aside transparency, we see that these forms have multiple targets of harmony. Does the final vowel in each case receive its value by agreement with, or copy from, the stem-final vowel in the same computational step as the vowel of the /-llA/ suffix that is adjacent to the stem? Or does the harmony propagate iteratively, first affecting the closest potential target, which then serves as a trigger for the next potential target? These are the kinds of issues that harmony forces us to confront.

Vowel harmony systems vary along a number of dimensions. In Finnish, the harmonic feature is [back], but many languages have harmony of other features, two common ones being roundness and advanced tongue root ([round] and [ATR]). An example of the latter is Tangale (Kidda, 1993), which also exemplifies the other kind of neutral behavior, opaqueness. The /a/ vowel fails to harmonize, and furthermore blocks spreading of a harmonic feature. Examples (2a)–(2f) show Tangale ATR harmony:

(2a)	seb-U	[sebu]	'look' (IMP)
(2b)	kɛn-U	[kɛnʊ̈]	'enter' (IMP)
(2c)	peer-na	[peerna]	'compelled'
(2d)	pɛd-na	[pɛdna]	'untied'
(2e)	ɗob-Um-gU	[ɗobumgu]	'called us'
(2f)	ɗib-na-m-gU	[ɗibnamgʊ̈]	'called you (PL)'

We see in Examples (2a)–(2d) that the value of the [ATR] feature spreads rightward in Tangale, but that /a/ does not alternate. Examples (2d)–(2f) show that /a/, in addition to not alternating, blocks spreading of [+ATR] to subsequent affixes, spreading its own [− ATR] value instead.

Some languages have harmony of more than one of feature, and the details of the process may differ for different features. Turkish is a well-known case of both [back] and [round] harmony. Examples (3a)–(3e) show Turkish vowel harmony:

	GEN SG	NOM PL	GEN PL	
(3a)	ip-in	ip-ler	ip-ler-in	'rope'
(3b)	kɨz-ɨn	kɨz-lar	kɨz-lar-ɨn	'girl'
(3c)	sap-ɨn	sap-lar	sap-lar-ɨn	'stalk'
(3d)	yüz-ün	yüz-ler	yüz-ler-in	'face'
(3e)	son-un	son-lar	son-lar-ɨn	'end'

Observe that the high vowel of the genitive marker suffix in the singular shows a four-way alternation of front/back and round/nonround, depending on the preceding vowel. The nonhigh vowel of the plural suffix alternates with respect to the front/back properties of the preceding vowel (with a concomitant automatic height adjustment between low and mid). Interestingly, the genitive plural forms, which are formed by adding to the stem the plural marker followed by the genitive marker, do not show the same four-way alternation in the genitive. This supports the idea that the appropriate suffix alternants are computed, not memorized, since the genitive marker that appears with *yüz* is not constant. This also supports the idea that the harmony triggers do not refer to morphological information such as 'look to the stem final vowel for a vowel to agree with.' It looks like the genitive marker of *yüz-ler-in* has its [−round] value in agreement with the directly preceding [− round] vowel of the plural marker – in fact, the vowel of the plural suffix is behaving opaquely: it does not alternate and it seems to initiate its own span of harmony.

We have only seen examples of harmony spreading from stems to suffixes. Dominant/recessive harmony systems differ from this pattern in having particular feature values, the dominant ones, with which all vowels in a word must agree. If one of these dominant values is present on any morpheme, whether stem or affix, then the whole word will have dominant-valued vowels. If no morphemes have a dominant vowel, the whole word will have recessive-valued vowels.

Finally, mention must be made of the difficulty posed by languages such as Hungarian having robust harmony systems, but with classes of exceptions. Hungarian words such as *víz* 'water', not surprisingly, take front harmony suffixes, so the dative is *víznek*.

However, *híd* 'bridge', like a long list of other roots with front nonlow vowels, takes back harmonic suffixes, so the dative is *hídnak*. Accounts for such cases may draw on differences in phonological representation, morphological classes, and multiple phonologies within a language, among others.

Harrington, John Peabody (1884–1961)

K A Klar, University of California, Berkeley, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

The phrase most commonly used to describe John Peabody Harrington is 'eccentric genius.' He was obsessive, driven, suspicious of others' motives, protective of his consultants and his data, and secretive with regard to the scope of his work. In spite of this, he made a singular contribution to the study and preservation of the native languages of North America. Over the course of more than 50 years of fieldwork, he collected data on over 100 different Native American languages. Harrington's phonetically detailed recordings are often the best and sometimes the only records that remain of the languages he worked on. Frequently, his work involved 'salvage' linguistics, recording languages that were on the edge of extinction. He felt keenly the urgency of the challenge to record dying languages and did his best to document as many of them as time and health would permit. He sought out every earlier record of each language he worked with and then assiduously 'rechecked' those attestations, most of which were not done with phonetic accuracy. Harrington has been criticized for this practice, but, in many cases, it was a useful technique for jogging the memories of consultants who had not spoken their languages for decades and ensured that older records could be properly interpreted.

Harrington was born in Waltham, Massachusetts, the elder of two sons of Mary Lydia Peabody and Elliot Augustus Harrington. The Harringtons traced their ancestry to before the American Revolution; at least one ancestor fought at the Battle of Lexington. They moved to Southern California in 1892, apparently for reasons of Elliot's health. The family was close, and in California they became successful farmers, growing apricots, walnuts, and other specialty crops on their land in the Simi Valley. Harrington became and remained a Californian; he seems never to have returned to Massachusetts as an adult, but neither did he ever lose his New England accent (as an aluminum disk recording of him interviewing his father in 1934 confirms).

Harrington was a born linguist. He studied German and Russian in high school, then majored in philology and classical languages at Stanford University, from which he obtained his B.A. in 1905 after only three undergraduate years. He was nominated for a Rhodes Scholarship by his Stanford mentor, Henry Rushton Fairclough, but did not show up to take the required placement test, a pattern that he would repeat throughout his life. On his own, he began studying Armenian with speakers he met in Southern California. His first field experience (according to his *curriculum vitae*) with California languages was with speakers of Ineseño Chumash as early as 1902. In 1905 and 1906, after obtaining his Stanford degree, he traveled to Leipzig and Berlin for training in the latest 'linguistic science' with scholars such as Karl Brugmann, August Leskien, Edouar Eduard Sievers, and Franz Niklaus Finck.

He had hoped to return to Berlin to do further work with Finck, but the latter's unexpected death in 1910 ended those plans. In Germany, Harrington would likely have undertaken fieldwork on Caucasian languages. But when it became necessary for him to stay in the United States, he took up the study of the native languages of North America in earnest. He

However, *híd* 'bridge', like a long list of other roots with front nonlow vowels, takes back harmonic suffixes, so the dative is *hídnak*. Accounts for such cases may draw on differences in phonological representation, morphological classes, and multiple phonologies within a language, among others.

Harrington, John Peabody (1884–1961)

K A Klar, University of California, Berkeley, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

The phrase most commonly used to describe John Peabody Harrington is 'eccentric genius.' He was obsessive, driven, suspicious of others' motives, protective of his consultants and his data, and secretive with regard to the scope of his work. In spite of this, he made a singular contribution to the study and preservation of the native languages of North America. Over the course of more than 50 years of fieldwork, he collected data on over 100 different Native American languages. Harrington's phonetically detailed recordings are often the best and sometimes the only records that remain of the languages he worked on. Frequently, his work involved 'salvage' linguistics, recording languages that were on the edge of extinction. He felt keenly the urgency of the challenge to record dying languages and did his best to document as many of them as time and health would permit. He sought out every earlier record of each language he worked with and then assiduously 'rechecked' those attestations, most of which were not done with phonetic accuracy. Harrington has been criticized for this practice, but, in many cases, it was a useful technique for jogging the memories of consultants who had not spoken their languages for decades and ensured that older records could be properly interpreted.

Harrington was born in Waltham, Massachusetts, the elder of two sons of Mary Lydia Peabody and Elliot Augustus Harrington. The Harringtons traced their ancestry to before the American Revolution; at least one ancestor fought at the Battle of Lexington. They moved to Southern California in 1892, apparently for reasons of Elliot's health. The family was close, and in California they became successful farmers, growing apricots, walnuts, and other specialty crops on their land in the Simi Valley. Harrington became and remained a Californian; he seems never to have returned to Massachusetts as an adult, but neither did he ever lose his New England accent (as an aluminum disk recording of him interviewing his father in 1934 confirms).

Harrington was a born linguist. He studied German and Russian in high school, then majored in philology and classical languages at Stanford University, from which he obtained his B.A. in 1905 after only three undergraduate years. He was nominated for a Rhodes Scholarship by his Stanford mentor, Henry Rushton Fairclough, but did not show up to take the required placement test, a pattern that he would repeat throughout his life. On his own, he began studying Armenian with speakers he met in Southern California. His first field experience (according to his *curriculum vitae*) with California languages was with speakers of Ineseño Chumash as early as 1902. In 1905 and 1906, after obtaining his Stanford degree, he traveled to Leipzig and Berlin for training in the latest 'linguistic science' with scholars such as Karl Brugmann, August Leskien, Edouar Eduard Sievers, and Franz Niklaus Finck.

He had hoped to return to Berlin to do further work with Finck, but the latter's unexpected death in 1910 ended those plans. In Germany, Harrington would likely have undertaken fieldwork on Caucasian languages. But when it became necessary for him to stay in the United States, he took up the study of the native languages of North America in earnest. He

had met Franz Boas's students Alfred Kroeber and Pliny Earle Goddard in a summer session course at the University of California at Berkeley; under their influence, he did his first major fieldwork with Mojave, Yuman, and Chumashan. From 1909 to 1915 he worked on several Pueblo languages under the tutelage of Edgar Lee Hewett at the School of American Archaeology in Santa Fe, New Mexico. He also taught summer school in San Diego, where, in 1915, he met Carobeth Tucker, whom he would marry a year later. Carobeth's keen ear and natural linguistic ability impressed Harrington and he began training her as a field assistant. Many of the field notes from 1916 to 1920 bear witness to her skill. They separated in 1920 and were divorced in 1921. Remarkably, Carobeth reactivated her career almost 60 years later, publishing several books on Chemehuevi language and mythology as well as a memoir, *Encounter with an angry god*, of her years living and working with Harrington. They had one daughter, Awona.

Most of Harrington's professional relationships were difficult, but those of his long-time acquaintances, collaborators, and assistants whom he trusted thought highly of him both intellectually and personally. His skills as a language analyst and grammatical theorist were minimal, but in fieldwork practice he had no peer. To enhance his superb training and maximize his use of time, he continually sought out and used new technology, including wax cylinders, aluminum disks, and specially fitted automobiles. Harrington often stored papers with friends and acquaintances or in warehouses, and scholars suspect that there are still caches of field notes which have not turned up in the decades since his death, but what has been located comprises a collection of staggering size: His field notes, correspondence, photographs, and personal papers occupy approximately 208 linear meters (683 linear feet) at the National Anthropological Archives (Smithsonian Institution). A smaller, but still substantial, collection resides at the Santa Barbara Museum of Natural History in California, and he is represented by correspondence and occasional sheaves of notes in many archives throughout the United States and Canada.

Many of the early curatorial pioneers of American museums were from the same Yankee subculture as Harrington, but he generally kept to himself, seeing most of them as 'armchair' scientists. The Boasians were exceptions; they were actively engaged in fieldwork and research, and most had employment at reputable academic institutions. Harrington considered them, especially Edward Sapir, as his intellectual equals, but worried that he had no such secure position. In February 1915, he was finally appointed an ethnologist at the Bureau of American Ethnology, a position he held until his retirement in 1954.

At the beginning of his professional career, Harrington was in contact with Boas and many of his students, including Sapir, but his general unreliability in following through with promised projects, his secretive nature, and his often thinly disguised anti-Semitism made these relationships difficult. In 1913, on the recommendation of Sapir, Boas appointed him to the committee of the American Anthropological Association charged with developing a comprehensive set of orthographic conventions for recording American Indian languages. He came through with a highly detailed set of recommendations, many of which were incorporated into the committee's final document, but the other committee members found Harrington trying, and dropped him from the committee on the pretext that he was not a dues-paying member of the AAA.

In the three decades following his divorce in 1921, Harrington's life settled into a pattern which he would sustain until his retirement. He disliked having to spend time in Washington, D.C., where his employers insisted he make periodic appearances, and he went to great lengths to avoid trips to the East Coast. On several occasions, he brought native consultants with him to Washington so that he would not lose valuable time away from them while he fulfilled his administrative duties. From a California 'base' in Santa Barbara, he undertook extensive fieldwork on Costanoan languages and continued his work with Chumashan, particularly Barbareño; he worked with three generations of speakers of that language. He often took secretive field trips to follow up on tips about possible speakers of other languages, and he trained several research assistants (including Jack Marr and Harrington's own nephew, Arthur Harrington) to extend his reach. He developed a close working relationship with other eccentric collectors of native languages and lore, including Frank Latta and C. Hart Merriam. The largest portions of Harrington's corpus are notes on Costanoan and Chumashan, but he worked at some time on languages belonging to nearly every language stock on the western North American coast and many inland languages as well.

A common misperception is that Harrington published very little. His output (not including his poetry) amounts to over 100 items. His data have been used in innumerable publications, and large portions of his notes have appeared as monographs by other scholars (see Bibliography). Ironically, the languages and cultures to which he devoted the greatest effort – the Chumashan and Costanoan – are hardly represented at all in his bibliography. Perhaps the most surprising

aspect of his legacy is the part that his recordings are playing in current language revitalization efforts. It is not unusual to find the descendants of some of the last speakers Harrington worked with looking to his collection for the materials they need – and can get nowhere else – in their efforts at language and cultural revival.

After his retirement, he lived in Santa Barbara, where he continued to work on Barbareño Chumash with Mary Yee, the last speaker of that language. Mrs Yee took care of him during his later years; at the end of his life, his daughter Awona brought him to San Diego where he passed away in 1961.

This article is reproduced from the previous edition, volume 3, pp. 1522–1523, © 1994, Elsevier Ltd.

James Harris is credited with writing the most comprehensive philosophical grammar in eighteenth-century England. Clearly his work reflects the seventeenth-century tradition of John Wilkins (*see* **Wilkins, John (1614–1672)**) and his colleagues (*see* **Universal Language Schemes in the 17th Century**).

He was born on July 20, 1709, and educated at Wadham College, Oxford. Later he studied law at Lincoln's Inn and became a magistrate in Salisbury. He held a variety of high level political offices such as Lord of the Admiralty, Lord of the Treasury, and Comptroller to the Queen. He died on December 22, 1780 and was buried in Salisbury Cathedral. Throughout his life, he was devoted to the study of art, literature, music, philology, and poetry, and he wrote several treatises on his studies.

His principal work in linguistics was *Hermes: or, a philosophical inquiry concerning language and universal grammar* (1751), in which he argued that the study of language was inseparable from that of thought; consequently, he maintained that the study of language relied on logical inquiry as well as the experimental method. He defined philosophical grammar as "that grammar, which without regarding the several idioms of particular languages, only respects those principles that are essential to them all" (1751: 11). His approach to language study drew heavily upon two traditions: first, the ancient philosophical tradition as his copious references to Socrates, Plato (*see* **Plato and His Predecessors**), Aristotle (*see* **Aristotle and Linguistics**), and Priscian will attest; and second, the 17th-century empirical tradition.

More than any of his seventeenth-century predecessors, Harris blended an Aristotelian natural philosophy with Cartesian scientific method (*see* **Aristotle and the Stoics on Language**). He explicitly advanced the notion that a theory of language depended upon a theory of mind. He pointed out that the "mind, like other powers, can be only known from its operation" (1751: xiv) and only through logical analysis or "viewing the mind during its process" (1751: xiv). Thus, Harris insisted that the operation and the process of the mind ought to be the proper subjects of the grammarian because the source of language was the mind and the development of the utterance was connected to mental process. For Harris, grammatical speculation depended upon an integration of philosophy, logic, and science.

Harris recognized that semantics was crucial to linguistic analysis, and he argued that the basis of meaning was the conformation of the word to reality. Unlike the proponents of the 17th-century universal language movement who sought clarity in artificial

aspect of his legacy is the part that his recordings are playing in current language revitalization efforts. It is not unusual to find the descendants of some of the last speakers Harrington worked with looking to his collection for the materials they need – and can get nowhere else – in their efforts at language and cultural revival.

After his retirement, he lived in Santa Barbara, where he continued to work on Barbareño Chumash with Mary Yee, the last speaker of that language. Mrs Yee took care of him during his later years; at the end of his life, his daughter Awona brought him to San Diego where he passed away in 1961.

This article is reproduced from the previous edition, volume 3, pp. 1522–1523, © 1994, Elsevier Ltd.

James Harris is credited with writing the most comprehensive philosophical grammar in eighteenth-century England. Clearly his work reflects the seventeenth-century tradition of John Wilkins (*see* **Wilkins, John (1614–1672)**) and his colleagues (*see* **Universal Language Schemes in the 17th Century**).

He was born on July 20, 1709, and educated at Wadham College, Oxford. Later he studied law at Lincoln's Inn and became a magistrate in Salisbury. He held a variety of high level political offices such as Lord of the Admiralty, Lord of the Treasury, and Comptroller to the Queen. He died on December 22, 1780 and was buried in Salisbury Cathedral. Throughout his life, he was devoted to the study of art, literature, music, philology, and poetry, and he wrote several treatises on his studies.

His principal work in linguistics was *Hermes: or, a philosophical inquiry concerning language and universal grammar* (1751), in which he argued that the study of language was inseparable from that of thought; consequently, he maintained that the study of language relied on logical inquiry as well as the experimental method. He defined philosophical grammar as "that grammar, which without regarding the several idioms of particular languages, only respects those principles that are essential to them all" (1751: 11). His approach to language study drew heavily upon two traditions: first, the ancient philosophical tradition as his copious references to Socrates, Plato (*see* **Plato and His Predecessors**), Aristotle (*see* **Aristotle and Linguistics**), and Priscian will attest; and second, the 17th-century empirical tradition.

More than any of his seventeenth-century predecessors, Harris blended an Aristotelian natural philosophy with Cartesian scientific method (*see* **Aristotle and the Stoics on Language**). He explicitly advanced the notion that a theory of language depended upon a theory of mind. He pointed out that the "mind, like other powers, can be only known from its operation" (1751: xiv) and only through logical analysis or "viewing the mind during its process" (1751: xiv). Thus, Harris insisted that the operation and the process of the mind ought to be the proper subjects of the grammarian because the source of language was the mind and the development of the utterance was connected to mental process. For Harris, grammatical speculation depended upon an integration of philosophy, logic, and science.

Harris recognized that semantics was crucial to linguistic analysis, and he argued that the basis of meaning was the conformation of the word to reality. Unlike the proponents of the 17th-century universal language movement who sought clarity in artificial

languages, Harris believed that natural languages were capable of precision.

Hermes was subject to mixed criticism: some considered the work significant as is indicated by its many editions and foreign translations. Others found the work too abstract, old fashioned, and confusing (Aarsleff, 1967; Asbach-Schnitker, 1973).

Harris, Zellig S. (1909–1992)

M Piot, University of Grenoble, Grenoble, France

© 2006 Elsevier Ltd. All rights reserved.

Zellig Sabbettai Harris was born in 1909 in Balta, Ukraine. He moved to Philadelphia, Pennsylvania, with his family when he was four. A student in the Oriental Studies department, he received his bachelor's (1930), master's (1932), and doctoral (1934) degrees from the University of Philadelphia, where he also appeared as an important figure of the 'Avukah' (1925–1943 Zionist student organization in the United States). He began to teach at the same University in 1931, and would go on to found the first linguistics department in the United States at that institution in 1946. His entire career lay there until his retirement in 1979. After that, he was associated with Columbia University. During World War II, like Bloomfield, he also was closely involved in the U.S. military development of teaching materials, and he wrote beginning handbooks for Pacific and Far East languages for the American landing troops in this whole area. Harris was the director of the Transformations and Discourse Analysis Project, sponsored by the U.S. National Science Foundation (1958–1980) at the University of Pennsylvania and later at Columbia University. In 1966, he was named to the prestigious position of Benjamin Franklin Professor of Linguistics. He was a faithfully contributor to *Language* and served as president of the Linguistic Society of America in 1955. He was a member of the American Philosophical Society and of the National Academy of Sciences. He was an active member of the kibbutz Mishmar Haemek and for years commuted between Philadelphia and Israel. His political opinions were close to socialism and anarchism. They are stated in the last book he wrote at the end of his life.

His master's dissertation on the 'Origin of the Alphabet' was published in the *Journal of the American Oriental Society* (1933), and his first book (and doctoral dissertation) *A grammar of the phoenician language* (1934) made a great impression and attracted the attention of Edward Sapir. He taught in 1937 at the Ann Arbor Linguistics Institute of the University of Michigan where Edward Sapir was the leading figure. His next book *Development of the Canaanite dialects: An investigation in linguistic history* (1939) is an exemplary philological study of the early history of the Canaanite branch of West Semitic (Phoenician dialects, Hebrew, Moabite, etc.).

By 1940 his attention had already turned to general linguistics, and from then on, the development of his thought may helpfully be divided into three, in part overlapping, phases. As he said himself, Harris was influenced by Sapir and by Leonard Bloomfield, although he did not formally study with either of them. Both tried to understand the phenomenon of meaning in language, just as Harris always did. The first phase began in 1942 and may be seen to end in 1955, with the study of other languages such as Native American languages, African languages, etc., articles on the morpheme and, above all, *Methods in structural linguistics* (1951), a book that made him famous. Harris restated and extended distributional methods of Bloomfield and Sapir.

A second phase began in 1952 with *Discourse analysis*. Inspired by algebra, he introduced the concept, and the term, of a grammatical 'transformation,' satisfying the needs of discourse analysis, applied to English and the languages of science. He also invented X–bar notation. His transformational theory was developed in more detail in *Mathematical structures of language* (1968). There, Harris presented an important alternative to the judgment of

languages, Harris believed that natural languages were capable of precision.

Hermes was subject to mixed criticism: some considered the work significant as is indicated by its many editions and foreign translations. Others found the work too abstract, old fashioned, and confusing (Aarsleff, 1967; Asbach-Schnitker, 1973).

As he said himself, Harris was influenced by Sapir and by Leonard Bloomfield, although he did not formally study with either of them. Both tried to understand the phenomenon of meaning in language, just as Harris always did. The first phase began in 1942 and may be seen to end in 1955, with the study of other languages such as Native American languages, African languages, etc., articles on the morpheme and, above all, *Methods in structural linguistics* (1951), a book that made him famous. Harris restated and extended distributional methods of Bloomfield and Sapir.

A second phase began in 1952 with *Discourse analysis*. Inspired by algebra, he introduced the concept, and the term, of a grammatical 'transformation,' satisfying the needs of discourse analysis, applied to English and the languages of science. He also invented X–bar notation. His transformational theory was developed in more detail in *Mathematical structures of language* (1968). There, Harris presented an important alternative to the judgment of

comparative acceptability. Instead of the grading of acceptability, a given sentence is 'out of context,' and the informant can provide a suitable context for it. In this theory a transformation works on a construction (or on two constructions in cases of conjunction).

In 1969, Harris changed his course. The basic ideas of Harris's last phase became clear in the 1970s, in papers in English and more fully in translation into French (1976) headed under 'operator grammar'. Any sentence of the base is a report. The limitation on the co-occurrence of words holds only within the operator–argument relation in a report. The role of transformations is different in this theory from what it was in Harris's previous theory. Reductions do not create new information, but introduce and thereby explain the ambiguities present in language. Harris was always prepared to use new techniques for the same purpose – to find formal properties of language, in particular properties that correspond to meaning or information. The new theory does not invalidate the previous ones; it only presents another aspect of the problem. In 1982, Harris published his masterpiece, *A grammar of English on mathematical principles*. In his last years, he published a book (1992), among others, of reflections on the variety of approaches he had been taking toward language. One can only admire the steadfastness with which he carried his project through. He was one of the half dozen or so American linguists whose work has had the greatest influence both in his own land and abroad.

Hart, John (1501–1574)

W Viereck, Universität Bamberg, Bamberg, Germany

© 2006 Elsevier Ltd. All rights reserved.

John Hart's date of birth must have been sometime in the summer of 1501. His family came from Middlesex, and although little is known about his life, he entered Heralds' College, also called the College of Arms, at an early age. He must have spent much of his life in government service, also abroad, probably in France, for he studied the works of Meigret and Peletier and other spelling reformers. In the late 1540s, he was appointed Newhaven Pursuivant Extraordinary, and in 1567 he was created Chester Herald. Hart knew Latin and French well and also had a good knowledge of Greek and Hebrew. He died in London in 1574.

Hart was the author of three works on English spelling and pronunciation. The first exists only in manuscript, *The opening of the unreasonable writing of our inglish toung* (1551), which he dedicated to Edward VI. The second is *An orthographie, conteyning the due order and reason, howe to write and painte thimage of mannes voice, most like to the life or nature*, published in 1569. The third came out 1 year later; a primer of reading according to Hart's new alphabet, it was titled *A methode or comfortable beginning for all unlearned*. In his spelling he tried to bring orthography into harmony with pronunciation. However, he could not free himself from traditional spelling. In choosing the form of speech, he was guided by the consent "of the learned and the literate." He wanted to teach the best English, and in his opinion "the flower of the English tongue" was used in the Court and in London.

Hart was an excellent phonetician; he was in fact the best phonetician of the 16th century. His *Orthographie* contains a detailed description of the phonology of the standard English of his time, and his fine observations in the consonantal range, which are mirrored in his spelling, include the aspiration of voiceless stops (thus, *pound* is rendered by him as *p-hound*, *pipe* as *p-heip*, and *open* as *o·p-hen*), a sentence-phonetic variation between /s/ (occurring before voiceless consonants) and /z/ (occurring before voiced sounds) as in <iz uel> (*is well*), <az ani>, but <is sed>, <ðis salt>, and a differentiation for *if* and *of* spelled <if> or <of> before a voiceless consonant but <iv>/<ov> before a vowel or voiced consonant, as in <iv iu> (*if you*). No spelling reformer or phonetician before him had made these observations. Hart also described sounds that occur in other languages; in this, as in the case of German *ch*, which he thought was *kh*, he was, however, less successful.

Hattori, Shiro (1908–1995)

M McCaskey, Georgetown University, Washington, DC, USA

© 2006 Elsevier Ltd. All rights reserved.

Hattori Shirō (**Figure 1**) was born in 1908, in Mie Prefecture, in the Ise area, where he received his early education. He studied Japanese language and linguistics at Tokyo University under the guidance of Hashimoto Shinkichi (1882–1945), a leading authority on ancient Japanese epigraphy and modern Japanese morphology and syntax. Hattori developed an interest in historical linguistics and began to study affinities between Japanese and Northeast Asian languages such as Ainu, Korean, Manchu, and Mongolian.

In 1933 Hattori received a grant from the Tokyo Institute for Advanced Studies of Language that allowed him to study Altaic languages in Manchuria and Inner Mongolia. At the end of a decade of field research he became an associate professor of Linguistics at Tokyo University. He completed a book on the Mongolian writing system (*Mōko-ji nyūmon*) in 1943, and a study of Mongolian language (Mōko to sono gengo) in 1946. Hattori continued his Altaic research, culminating in a three-volume study (*Arutai shogengo no kenkyū*), published when he was eighty years old.

Following the end of World War II Hattori changed his field research focus to Hokkaido, where he gathered data on Ainu. His Tokyo University students assisted him in compiling a comprehensive Ainu dictionary (*Ainugo hōgen jiten*), published in 1964. These assistants later formed a new generation of Ainu scholars at universities in Japan and the West, regarding Hattori as the founder of the modern study of Ainu language and linguistics.

Hattori began work in phonetics and phonology, publishing a general study on the subject *(Onseigaku)*, in 1954. He had done research on Chinese historical

Figure 1 Hattori Shirō. Source: Tokyo University Press.

phonology in *Genchō hishi no Mōkogo o arawasu kanji no kenkyū,* a 1946 study of how Mongol terms were phonetically transcribed in a fourteenth century Chinese translation of the *Secret history of the Mongols.* In 1958, Hattori published *Chūgen-on-in no kenkyū,* a phonological study of the *Zhongyuan yinyun,* a fourteenth-century Chinese rhyming dictionary, in conjunction with a younger Tokyo University colleague, Tōdō Akiyasu (1915–1985). Tōdō, who regarded Hattori as his lifelong mentor, subsequently became one of the leading authorities on Chinese historical phonology and lexicology in the world.

Hattori actively continued his multifaceted research for the remainder of his life, becoming regarded as the foremost linguist in Japan, by scholars in Japan and throughout the world. Roman Jakobson (1896–1982) and other leading Western linguists honored him with the festschrift *Studies in general and oriental linguistics, presented to Shirō Hattori on the occasion of his sixtieth birthday,* published in 1970, and this was followed two years later by a similar tribute from Hattori's Japanese colleagues. Hattori, however, continued his work until his death more than twenty years later, in 1995.

In 1981 Hattori collaborated with the Australian cartographer Stephen Wurm, producing a *Language atlas of the Pacific area.* During the 1980s, Hattori not only edited his own earlier works for definitive publication, he also edited the collected works of the Okinawan ethnologist Iha Fuyu (1876–1947), published in ten volumes in 1993. One of Hattori's last new works was *Yamatai-koku wa doko* (1990), a book investigating the nature and exact boundaries of the realm of Yamatai, the most ancient Japanese state, mentioned in early Chinese chronicles.

Haugen, Einar (1906–1994)

J G Fought, Diamond Bar, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

Einar Haugen was born in Sioux City, Iowa to Norwegian immigrant parents; some years of his boyhood were spent in Norway. He graduated from St. Olaf College in Northfield, Minnesota in 1928, and studied English and Scandinavian at the University of Illinois at Urbana, receiving his Ph.D. in 1931. He then served on the faculty of the University of Wisconsin at Madison from 1931 to 1962, when he took a position in Scandinavian and linguistics at Harvard. He was granted honorary degrees by a number of U.S. and foreign universities, and served as president of the Linguistic Society of America, the American Dialect Society, and the Society for the Advancement of Scandinavian Studies. He frequently taught at summer linguistic institutes.

The Norwegian language and culture and its Scandinavian context, together with the experience of bilingualism, were central both to Haugen's scholarly work and to his life. He established the study of linguistic and social aspects of bilingualism within U.S. linguistics before there was a recognized field of sociolinguistics. His work encompassed the languages and literature of Scandinavia in their historical development as well as their modern forms. Both his descriptive works and his more theoretically oriented writings were richly endowed with empirical content. His explorations of 'semicommunication' (1966b), beginning in the 1950s, and his comprehensive view of bilingualism along axes of relative proficiency in and relative structural difference between the two languages of a bilingual, as a basis for exploration, are emblematic of his empirically rich and deeply nuanced understanding of bilingualism. As a senior figure in the Linguistic Society of America, Haugen sought to moderate the theoretical squabbles of American structuralism in the 1950s and to draw attention to other points of view, such as Louis Hjelmslev's work. He was among the first to champion

phonology in *Genchō hishi no Mōkogo o arawasu kanji no kenkyū,* a 1946 study of how Mongol terms were phonetically transcribed in a fourteenth century Chinese translation of the *Secret history of the Mongols.* In 1958, Hattori published *Chūgen-on-in no kenkyū,* a phonological study of the *Zhongyuan yinyun,* a fourteenth-century Chinese rhyming dictionary, in conjunction with a younger Tokyo University colleague, Tōdō Akiyasu (1915–1985). Tōdō, who regarded Hattori as his lifelong mentor, subsequently became one of the leading authorities on Chinese historical phonology and lexicology in the world.

Hattori actively continued his multifaceted research for the remainder of his life, becoming regarded as the foremost linguist in Japan, by scholars in Japan and throughout the world. Roman Jakobson (1896–1982) and other leading Western linguists honored him with the festschrift *Studies in general and oriental linguistics, presented to Shirō Hattori on the occasion of his sixtieth birthday,* published in 1970, and this was followed two years later by a similar tribute from Hattori's Japanese colleagues. Hattori, however, continued his work until his death more than twenty years later, in 1995.

As a senior figure in the Linguistic Society of America, Haugen sought to moderate the theoretical squabbles of American structuralism in the 1950s and to draw attention to other points of view, such as Louis Hjelmslev's work. He was among the first to champion

the recognition and study of complex phenomena of language use in heterogeneous communities. For Haugen, linguistics was always an empirical discipline, not an abstract theoretical domain. In a period when many linguists sought to draw fine lines and sharp distinctions, Haugen was among the first U.S. structuralists to show the rich textures of gradient transitions. He worked steadily and insightfully on the interactions of language and culture within the United States and Scandinavia, helping his students and their students to broaden the scope and enrich the content of American linguistics.

Hausa

P J Jaggar, University of London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Hausa is a Chadic (Afroasiatic) language spoken by an estimated 30 million or more first-language speakers (more than any other sub-Saharan language), mainly in northern Nigeria and southern Niger. It is also spoken by diaspora communities of traders, Muslim scholars, and immigrants in (mainly) urban areas of west Africa (e.g., Ghana, Cameroon), and also in the Blue Nile Province of the Sudan. Hausa is the most important and widespread west African language and continues to expand as a transnational lingua franca.

Hausa is used extensively in commercial, governmental, and educational spheres, and in the mass media. There are a number of Hausa-language newspapers, and book publishing, television, and video production are active. Many radio stations, both African and international, broadcast in (mainly Standard Kano) Hausa, including the BBC World Service, Voice of America, Radio Deutsche Welle, and China Radio International. A number of universities in Nigeria and Niger offer undergraduate and postgraduate degree courses in Hausa, and there are specialists in Hausa language and/or literature involved in comparable programs at universities in Europe, the United States, Japan, China, and South Korea. It has the best dictionaries (Bargery, 1934; Abraham, 1962; R. M. Newman, 1990) and reference grammars (Caron, 1991; Wolff, 1993; P. Newman, 2000; Jaggar, 2001) of any African language.

Substantial borrowing from neighboring African languages, such as Kanuri (central), the Mande group, Tuareg (Tamahaq, Tahaggart), Yoruba and Fula(ni) a single language (with considerable dialectal variation), has enriched the Hausa lexicon. Most loanwords come from Arabic, English, and French, however, with Arabic loans encompassing such semantic fields as religion (Islam was introduced to the area more than 500 years ago), education, government, law, commerce, war, and horsemanship. Over the past 100 years, an ever-growing number of loanwords from English (Nigeria) and French (Niger) have been incorporated, typically denoting material objects and technology, education, and governmental and military positions.

Hausa has been written for more than 200 years in Arabic script ('àjàmi; see below for transcription), a system prevalent in Koranic schools and still used by many (mainly non-western-educated) Hausas for religious and literary purposes. However, 'àjàmi has been gradually supplanted by a modified Latin script/alphabet called bookòo (probably < English 'book'), which does not, however, mark contrastive tone or vowel length. Hausa dialects vary in phonology, lexicon, and grammatical morphemes, and can be broadly grouped into Eastern Hausa (e.g., Kano = Standard Hausa, the variety described here), Western Hausa (e.g., Sokoto), and dialects in Niger (e.g., Aderanci).

Phonology

Hausa (Standard/Kano) has 32 consonant and 12 vowel phonemes (10 short/long monophthongal pairs plus two diphthongs). (See **Table 1**.)

Hausa has two level tones, (H)igh (unmarked a[a]), and (L)ow (indicated with a grave accent on the first vowel à[a]), e.g., kiifii 'fish', màcè 'woman', roogòo 'cassava', sàuka 'get down'. There is also a contour (H͡L) Falling tone (indicated with a circumflex), which occurs on heavy syllables, e.g., râi 'life', kwântaa 'lie

the recognition and study of complex phenomena of language use in heterogeneous communities. For Haugen, linguistics was always an empirical discipline, not an abstract theoretical domain. In a period when many linguists sought to draw fine lines and sharp distinctions, Haugen was among the first U.S. structuralists to show the rich textures of gradient transitions. He worked steadily and insightfully on the interactions of language and culture within the United States and Scandinavia, helping his students and their students to broaden the scope and enrich the content of American linguistics.

Introduction

Hausa is a Chadic (Afroasiatic) language spoken by an estimated 30 million or more first-language speakers (more than any other sub-Saharan language), mainly in northern Nigeria and southern Niger. It is also spoken by diaspora communities of traders, Muslim scholars, and immigrants in (mainly) urban areas of west Africa (e.g., Ghana, Cameroon), and also in the Blue Nile Province of the Sudan. Hausa is the most important and widespread west African language and continues to expand as a transnational lingua franca.

Hausa is used extensively in commercial, governmental, and educational spheres, and in the mass media. There are a number of Hausa-language newspapers, and book publishing, television, and video production are active. Many radio stations, both African and international, broadcast in (mainly Standard Kano) Hausa, including the BBC World Service, Voice of America, Radio Deutsche Welle, and China Radio International. A number of universities in Nigeria and Niger offer undergraduate and postgraduate degree courses in Hausa, and there are specialists in Hausa language and/or literature involved in comparable programs at universities in Europe, the United States, Japan, China, and South Korea. It has the best dictionaries (Bargery, 1934; Abraham, 1962; R. M. Newman, 1990) and reference grammars (Caron, 1991; Wolff, 1993; P. Newman, 2000; Jaggar, 2001) of any African language.

Substantial borrowing from neighboring African languages, such as Kanuri (central), the Mande group, Tuareg (Tamahaq, Tahaggart), Yoruba and Fula(ni) a single language (with considerable dialectal variation), has enriched the Hausa lexicon. Most loanwords come from Arabic, English, and French, however, with Arabic loans encompassing such semantic fields as religion (Islam was introduced to the area more than 500 years ago), education, government, law, commerce, war, and horsemanship. Over the past 100 years, an ever-growing number of loanwords from English (Nigeria) and French (Niger) have been incorporated, typically denoting material objects and technology, education, and governmental and military positions.

Hausa has been written for more than 200 years in Arabic script ('àjàmi; see below for transcription), a system prevalent in Koranic schools and still used by many (mainly non-western-educated) Hausas for religious and literary purposes. However, 'àjàmi has been gradually supplanted by a modified Latin script/alphabet called bookòo (probably < English 'book'), which does not, however, mark contrastive tone or vowel length. Hausa dialects vary in phonology, lexicon, and grammatical morphemes, and can be broadly grouped into Eastern Hausa (e.g., Kano = Standard Hausa, the variety described here), Western Hausa (e.g., Sokoto), and dialects in Niger (e.g., Aderanci).

Phonology

Hausa (Standard/Kano) has 32 consonant and 12 vowel phonemes (10 short/long monophthongal pairs plus two diphthongs). (See Table 1.)

Hausa has two level tones, (H)igh (unmarked a[a]), and (L)ow (indicated with a grave accent on the first vowel à[a]), e.g., kiifii 'fish', màcè 'woman', roogòo 'cassava', sàuka 'get down'. There is also a contour (H͡L) Falling tone (indicated with a circumflex), which occurs on heavy syllables, e.g., râi 'life', kwântaa 'lie

Table 1 Hausa: consonants

Consonants:							
vl	f	fy	t	c	k	kw	ky
vd	b		d	j	g	gw	gy
gl	ɓ		ɗ	'y	ƙ	ƙw	ƙy
vl			s	sh			
vd			z				
gl			ts				
	m		n				
			l				
			r				
			ř				
				y	w	h	ʔ

c [ʧ] and j [ʤ] = palato-alveolar affricates, sh = palatal fricative [ʃ]; ʔ = glottal stop (orthographic '); ɓ, ɗ = laryngealized (implosives), 'y = glottalized palatal glide, ƙ [k'] and ts [s'] = glottalized ejectives; r [ɽ] = retroflex flap, ř = alveolar tap/roll.
Vowels (i = short; ii = long): i, ii, e, ee, a, aa, o, oo, u, uu.
Diphthongs: ai, au.

down'. There are three syllable types: CV, CVV (long vowel or diphthong), and CVC (long vowels are forced to conform and are reduced in extra-heavy *CVVC syllables). When followed by a front vowel, the coronal stops t, d and fricatives s, z palatalize to c, j, and sh, j respectively, e.g., mèe sukà sàataa? 'what did they steal?', sun sàaci jàkaataa 'they stole my bag' (< *sàati), sun sàacee tà 'they stole it' (< *sàatee), taasàa 'metal bowl' → pl. taasooshii (< *taasoosii).

Morphology

Within the pronominal system, the basic cut is between the personal and nonpersonal sets. There are eight sets of personal pronouns, each of which comprises eight forms: five singular (masculine/feminine gender is distinguished in the second and third person singular), and three plural. Personal pronoun paradigms express various syntactic functions, e.g., independent, (in)direct object, possessive, and reflexive. Nonpersonal pronouns (marked for gender and number) include demonstratives, interrogatives, and indefinites.

The categories of tense-aspect/mood (TAM) and subject agreement (person, gender, number) are marked on a lexically independent preverbal 'person-aspect complex' (INFL), which includes an additional (ninth) plural impersonal form (usually with arbitrary human reference and equivalent to a null subject). The TAM morphemes can be either segmentable, e.g., (Habitual) ya-kàn zoo 'he regularly comes', or fusional, involving changes in tone and/or vowel length, e.g., (Perfective) yaa zoo 'he came' and (Subjunctive) yà zoo 'he should come', and the subject-agreement elements are morphologically related to the personal pronouns. There are 16 distinct affirmative and negative inflectional paradigms, with a major Perfective:Imperfective aspectual dichotomy.

Hausa verbs are categorized into seven basic and derived 'Grades' (Parsons, 1960), defined in terms of their morphology (a templatic tone pattern and termination) and argument structure, and resembling the *binyanim* verbal conjugations in distantly related Semitic languages. Of the basic Grades (0–3), Grade 2 verbs (two-syllable) are canonically LH tone and are exclusively transitive, with two core (nonoblique) arguments, e.g., (Hausa is SVO) Muusaa yaa 'àuri yaarinyàř 'Musa married the girl', Muusaa yaa 'àuree tà 'Musa married her'. These examples also demonstrate how the final vowel of a Hausa verb can undergo changes in quantity and/or quality conditioned by the word class of the following constituent, e.g., direct object noun or pronoun. The derived Grades (4–7) add their own valency and semantics to the core meaning of the base form, e.g., basic Grade 2 verb sàyaa 'buy' → derived Grade 4 sayèe 'buy up', Grade 5 sayař (dà) 'sell', Grade 6 sayoo 'buy and bring', and Grade 7 sàyu 'be completely bought up'. In the Imperfective, verbs are often replaced by participial-like verbal nouns, e.g., sunàa daawôo-waa 'they are coming back' (< Grade 6 daawoo 'come back' + 'wà- with floating L tone), mèe kakèe sàyee? 'what are you buying?' (< Grade 2 sàyaa 'buy' [Grade 2 verbal nouns are nonpredictable]).

Nouns are masculine or feminine gender in the singular (an inherited Afroasiatic feature), and gender is overtly marked. Most native Hausa nouns are vowel-final. Feminine nouns typically end in -aa, e.g., yaarinyàa 'girl', hùulaa 'cap', or suffix-(I)YAA or -(U)WAA, e.g., beebiyaa 'deaf mute (FEM)', gurgùwaa 'a cripple (MASC)'. Masculine nouns display a full range of final vowels (including -aa) and consonants, e.g., raamìi 'hole', beenee 'upper story', dilaa 'jackal', yaaròo 'boy', 'àbù 'thing', mùtûm 'man', ƙaamùs 'dictionary' (< Arabic).

Hausa noun (and adjectival) plurals are known for their complexity and involve suffixation, vowel insertion, and tonal melodies. They can be distilled into about 10 core classes, with the plural formation partially predictable from the canonical shape (e.g., tones, syllable structure) and, sometimes gender, of the singular. A disyllabic feminine singular with HL tone and final -aa, for example, will typically select a plural with the -ooCii suffix (where C = copy of final consonant of singular stem) and an all H tonal template, e.g. jiikàa 'grandchild' → pl. jiikookii. A disyllabic singular with a heavy CVV initial syllable and HH tones, on the other hand, is likely to pluralize by suffixing -àayee with HLH tones on the output, e.g., giiwaa 'elephant' → pl. giiwàayee.

Reduplication is pervasive, including (a) copying of a single consonant, e.g., past participial adjectives add a (MASC) suffix -aCCee, where CC = geminate copy of the stem-final consonant of the source verb, i.e., cìkakkee 'full, complete' < cikàa 'to fill'; (b) prefixal reduplication of the initial CVC- syllable of a sensory noun to form an intensive sensory adjective, e.g., zàzzaafaa 'very hot' (< zaaf-zaaf-aa) < zaafii); 'heat' (with gemination/assimilation of the coda C /f/); and (c) full reduplication (tones and segmentals), e.g., coocì-coocì 'churches' < coocì 'church', yâu-yâu 'this very day' < yâu 'today'.

Syntax

The basic word order is S-V-IO-DO (goal/recipient arguments precede theme arguments), e.g., (ditransitive clause).

(1) ɗaalìbîn yaa kaawoo
student.the 3MASC.SG.PERF *bring*
wà maalàminsà 'aikìi
to *teacher.his* *work*
'the student brought the work to his teacher'

In *wh*-questions, relative clauses, and focus constructions, displaced constituents are moved to clause-initial position and special 'focus' marking is triggered on the INFL (Hausa is discourse-configurational), e.g., (FOC-PERF = Focus Perfective).

(2) wàa kukà ganii
who 2PL.FOC-PERF *see*
'à kàasuwaa? (*wh*-question)
at *market*
'whom did you see at the market?'

(3) yaaròn kà nee mukà
boy.your COP 1PL.FOC-PERF
ganii (*ex situ* focus answer)
see
'it was your boy we saw'

(4) yaaròn dà mukà
boy.the REL 1PL.FOC-PERF
ganii (relativization)
see
'the boy that we saw'

Hausa is a pro-drop language, in that sentences can occur without overt NP subjects, e.g., $[Ø]_{subj}$ $[sun]_{infl}$ tàfi gidaa 'they have gone home', and it also licenses discourse-linked null (direct) objects, e.g., 'ii, naa sàyaa Ø 'yes, I bought (it)' (where Ø = null anaphor).

Negation in verbal sentences normally requires a double negative construction with the discontinuous morphemes bà(a) . . . ba, where the initial bà(a) occurs left-adjacent to INFL (following any overt subject), and the second is clause-final (though adverbs can occupy end position), as in (5) and (6).

(5) màataataa bà tà daawoo
wife.my NEG 3FEM.SG.PERF *return*
ba (Negative Perfective)
NEG
'my wife has not returned'

(6) bàa zaa sù yàr̃da ba (Negative Future)
NEG FUT 3PL *agree* NEG
'they will not agree'

The Negative Imperfective uses only an initial High tone marker, as in (7).

(7) baa sàa zuwàa
NEG 3PL.IMPERF *coming*
'they are not coming'

Within the NP, grammatical gender and number trigger agreement on: (a) prehead elements, including adjectival modifiers ([8], also posthead), indefinite determiners (8), interrogative determiners, and universal quantifiers (also posthead); as in (8) and (b) posthead elements, including definite determiners, demonstratives (also prehead), relatives, numerals, genitive phrases, e.g., possessive NP, as in (9).

(8) wani k̂àramin
INDEF.MASC.SG *small*.MASC.SG.*of*.MASC.SG
yaaròo
boy.MASC.SG
'a certain small boy'

(9) rìiga-r̃ Mammàn
gown.FEM-*of*.FEM *Mamman*
'Mamman's gown'

Like many African languages, Hausa has a lexically autonomous class of highly expressive, phonosemantic words known as 'ideophones,' which normally function and distribute (sometimes collocationally) like adverbials. Hausa ideophones have their own distinct phonological and phonotactic properties (e.g., final obstruents, anomalous tones), and are semantically marked. As sound-symbolic elements, they typically denote the intensity or manner of an action, event, or state, e.g., (distinctive sounds or visually distinctive actions or features) kwàngàr̃àm 'with a clang', shar̃af 'soaking wet', r̃asha-r̃asha 'all sprawled out', and can also function as adjectives, e.g., daɓaɓa 'pronounced (facial markings),' and fat 'pure (white)'.

Constructions lacking a canonical verbal element include clauses containing an Imperfective INFL and nonverbal predicate, as in (10) and (11).

(10) Hàliimà tanàa dà
Halima 3FEM.SG.IMPERF *with*
mootàa (possessive)
car
'Halima has a car'

(11) sunàa masallaacii (locative)
3PL.IMPERF *mosque*
'they are at the mosque'

Nonverbal clauses without any form of INFL include those in (12), (13), and (14).

(12) àkwai/baabù ruwaa nân (existential)
EXIST/NEG.EXIST *water* *here*
'there is/is not water here'

(13) gàa littaafìnkà (presentational)
PRES *book.your*
'here/there is your book'

(14) shii maalàmii nèe (equational/copular)
3MASC.SG *teacher* COP.MASC.SG
'he is a teacher'

This article is reproduced from the previous edition, volume 3, pp. 1527, © 1994, Elsevier Ltd.

Born in Prague in 1893, Bohuslav Havránek became a preeminent Slavist and an influential authority on the Czech language. He held positions at Masaryk University in Brno (1929–1945) and at Charles University in Prague from 1945 until his retirement in 1966. He also was a member of the Czechoslovak Academy of Sciences and directed the Institute for the Czech Language between 1946 and 1965.

Havránek played a significant role in the Prague Linguistic Circle during the interwar period, and he was instrumental in developing the field of Prague structural linguistics. He focused much attention elaborating on the written standard known as *spisovná čeština* ('Literary Czech') and its usage in Czech society. His other contributions at that time were in the fields of comparative Slavic grammar and the historical and comparative study of the Slavic literary languages. After World War II, Havránek led a collective of linguists and lexicographers dedicated to the publication of a multivolume dictionary of the Czech literary language, which was published by the Czechoslovak Academy of Sciences between 1960 and 1971. With Alois Jedliček he also prepared several editions of a comprehensive grammar of the Czech language. In addition, Havránek oversaw the publication of several leading Czech linguistic and philological journals, including *Slavia* and *Slovo i Slovesnost*. He was the recipient of the Czechoslovak Socialist Republic's State Prize in 1957 in recognition of his outstanding contributions to scholarship. Havránek was active in the Czechoslovak Committee of Slavists and was one of the organizers of the Sixth International Congress of Slavists held in Prague in 1968.

Havránek's legacy can be seen in the many volumes of dictionaries, grammars, handbooks, and readers of the Czech language. He seemed to have had a hand in most major projects, including a Czech–Russian dictionary, a dictionary of Old Czech, and a handbook of Czech orthographic rules. He contributed to the understanding of Czech dialects and the differences between literary and colloquial Czech.

Hawaiian

P Geraghty, University of the South Pacific, Suva, Fiji

© 2006 Elsevier Ltd. All rights reserved.

Hawaiian belongs to the Eastern Polynesian branch of the Oceanic subgroup of the Austronesian language family, its nearest relatives being Tahitian and Marquesan.

Until the early 19th century it was spoken by the entire population of the Hawaiian islands, and it remained the main language for most of that century. However, the decline of the indigenous population, massive immigration, educational policies, and annexation by the United States (in 1898) have taken their toll, and Hawaiian was replaced by Hawai'i Creole English in the early 20th century as the main language of the native Hawaiian population. It is now estimated to have less than 1000 first-language speakers, mostly elderly individuals and the residents of the small island of Ni'ihau, out of a total population of over one million. Given the popularity of Hawaiian music among tourists, it could be said that Hawaiian is a language more sung than spoken.

Over the past 30 years grassroots moves to revive and revitalize the language, particularly through Hawaiian medium education from preschool (*pūnana leo*) to tertiary level, have had considerable success, and the number of speakers is increasing. Critics, however, point out that the style of Hawaiian spoken by this new generation who learned it in school is rather different from that of native speakers. It is now estimated that there are 3000 fluent speakers of Hawaiian. There is very little Hawaiian-language radio and TV programming, and no newspaper.

Hawaiian had no traditional written form, and was first recorded by Captain Cook and his companions in 1778. A Roman-based alphabet was devised by English-speaking missionaries in 1829, and has remained in use relatively unchanged. In the 19th century, Hawaiians developed a high level of literacy through Hawaiian medium schools, and there is a large body of Hawaiian language literature from that period.

The phoneme inventory of Hawaiian consists of eight consonants (h, k, l, m, n, p, w, and glottal stop) and 10 vowels (a, e, i, o, u, ā, ē, ī, ō, ū). There are no consonant clusters and syllables are open. In writing, vowel length and glottal stop have often not been marked systematically. Most modern writers and publishers use a macron to indicate a long vowel and an inverted apostrophe (or apostrophe) to indicate the glottal stop.

There is very little morphophonemics, and most grammatical functions are performed by affixation or the use of pre- and postposed particles. Pronouns distinguish four persons (including first person inclusive and exclusive) and three numbers (singular, dual, and plural). There are two categories of possession, depending largely on whether or not the possessor has control over the fact of possession. In noun phrases, the order is head + attribute. The basic word order is VSO:

ua	inu	au	i	ka	wai	wela
asp.	*drink*	*I*	*obj.*	*the*	*water*	*hot*

'I drank the hot water'

Hawaiian

P Geraghty, University of the South Pacific, Suva, Fiji

© 2006 Elsevier Ltd. All rights reserved.

Hawaiian belongs to the Eastern Polynesian branch of the Oceanic subgroup of the Austronesian language family, its nearest relatives being Tahitian and Marquesan.

Until the early 19th century it was spoken by the entire population of the Hawaiian islands, and it remained the main language for most of that century. However, the decline of the indigenous population, massive immigration, educational policies, and annexation by the United States (in 1898) have taken their toll, and Hawaiian was replaced by Hawai'i Creole English in the early 20th century as the main language of the native Hawaiian population. It is now estimated to have less than 1000 first-language speakers, mostly elderly individuals and the residents of the small island of Ni'ihau, out of a total population of over one million. Given the popularity of Hawaiian music among tourists, it could be said that Hawaiian is a language more sung than spoken.

Over the past 30 years grassroots moves to revive and revitalize the language, particularly through Hawaiian medium education from preschool (*pūnana leo*) to tertiary level, have had considerable success, and the number of speakers is increasing. Critics, however, point out that the style of Hawaiian spoken by this new generation who learned it in school is rather different from that of native speakers. It is now estimated that there are 3000 fluent speakers of Hawaiian. There is very little Hawaiian-language radio and TV programming, and no newspaper.

Hawaiian had no traditional written form, and was first recorded by Captain Cook and his companions in 1778. A Roman-based alphabet was devised by English-speaking missionaries in 1829, and has remained in use relatively unchanged. In the 19th century, Hawaiians developed a high level of literacy through Hawaiian medium schools, and there is a large body of Hawaiian language literature from that period.

The phoneme inventory of Hawaiian consists of eight consonants (h, k, l, m, n, p, w, and glottal stop) and 10 vowels (a, e, i, o, u, ā, ē, ī, ō, ū). There are no consonant clusters and syllables are open. In writing, vowel length and glottal stop have often not been marked systematically. Most modern writers and publishers use a macron to indicate a long vowel and an inverted apostrophe (or apostrophe) to indicate the glottal stop.

There is very little morphophonemics, and most grammatical functions are performed by affixation or the use of pre- and postposed particles. Pronouns distinguish four persons (including first person inclusive and exclusive) and three numbers (singular, dual, and plural). There are two categories of possession, depending largely on whether or not the possessor has control over the fact of possession. In noun phrases, the order is head + attribute. The basic word order is VSO:

ua	inu	au	i	ka	wai	wela
asp.	*drink*	*I*	*obj.*	*the*	*water*	*hot*

'I drank the hot water'

Hawaiian Creole English

S Romaine, Oxford University, Oxford, UK

© 2006 Elsevier Ltd. All rights reserved.

Hawai'i Creole English (locally called 'Pidgin') is the first language of the majority of locally born children and the first language of somewhat less than half the state of Hawai'i's population of just over a million. Varieties of pidgin and creole English in Hawai'i arose from contact between Hawaiians, Europeans (primarily English speakers, who contributed most of the vocabulary to the emerging pidgin), and the various immigrant groups (e.g., Chinese, Japanese, Portuguese, and Filipinos) brought to Hawai'i to work as indentured laborers on plantations from the 1850s onward.

Increasing contact between creole speakers and speakers of mainland varieties of English after World War II and the political incorporation of the islands into the United States as the 50th state in 1959 have blurred the boundaries between Standard English and the creole, and created a continuum of varieties. Although adjacent varieties of the continuum are mutually intelligible, the two extreme endpoints may often not be. This example illustrates the variation.

ai go give om da book fo yu most creole-like
ai gon give om da book fo yu
ai going give om da book fo yu
aim gonna give om da book fo yu
ail give om/him/her/them the book fo yu least creole-like
I will give him/her/them the book for you most standard English-like

The most decreolized (i.e., most English-like) varieties are found on the island of O'ahu, where three-fourths of the state's population is located, along with the capital, Honolulu, and the main U.S. military base, Pearl Harbor. The outer islands of Kaua'i and Hawai'i are the least decreolized.

Although most of the vocabulary of Hawai'i Creole English is derived from English, as many as a thousand Hawaiian words may have been in use at one time during the plantation era; several hundred were probably in fairly common use colloquially. Although this number is now fewer, partly due to the decline in knowledge of Hawaiian, many still persist in local English and many more in the Hawai'i Creole English of older speakers. Younger people tend not to know the meanings of some words, such as *pio*, 'turn off, extinguish', and *kumu,* 'girlfriend, sweetheart', but virtually every resident locally would know *ono* 'tasty'. Many of these Hawaiian words are being replaced by English ones, although in some cases the English variants are still different from mainland U.S. English, e.g., *grinds* 'food' (cf. *kaukau* 'to eat/food').

Distinctive grammatical features include the lack of the copula *be* (*you da boss,* 'you are the boss'), use of *get* in both possessive and existential constructions (*get one wahine she get one daughter,* 'There is a woman who has a daughter'), use of *stay* for locatives and progressives (*Leilani stay inside da classroom,* 'Leilani is inside the classroom', *Charlene stay working,* 'Charlene is working'), use of *wen* or *had* as a simple past tense marker (*Joe wen/had talk to da coach,* 'Joe talked to the coach'), use of *pau* (Hawaiian 'done, finished') as a completive marker (*Call me when you pau,* 'Call me when you are finished'), preverbal negation (*Stan no mo rice,* 'Stan doesn't have any more rice'), and use of *for* as a complementizer (*Darrell like know how fo play basketball,* 'Darrell wants to know how to play basketball'). Word order is generally subject-verb-object, as in Standard English, apart from topic/comment structures such as *big, da house,* 'The house is big', in which the comment appears first.

There is considerable variation in pronunciation among local residents of different ethnic and social class backgrounds. Generally speaking, however, the phonology of Hawai'i Creole English has a smaller inventory of distinctive sounds than many mainland varieties of English. The [r] after a vowel in words such as *shark* is usually absent in the most creole-like speech varieties (i.e., 'park' [pak]), and many of the diphthongs (double vowels) found in mainland varieties of English in words such as *coat* [kout] and *day* [deɪ] are single vowels in the creole (i.e., [kot], [de]). Hawai'i Creole English often has full vowels where mainland varieties use reduced ones, e.g., [tudei], 'today', vs. mainland [tχde], and 'mountain' [mauntχn] vs. mainland [maunten]. English interdental fricatives in words such as *they* and *think* tend to become stops in the creole (i.e., [de], [tink]). The stops in consonant clusters such as [tr] in words such as *try* are affricated (i.e., [črai]), and initial [s] in clusters such as [str] in words such as *stress* sounds more like [š]. There are also some stress and intonational differences, such as the use of falling pitch for yes/no questions, which also do not show the subject/auxiliary inversion typical of standard English, e.g., *you like go Honolulu*? 'Do you want to go to Honolulu?' The falling intonation pattern has been carried over from Hawaiian into creole. Rising pitch together with a final question particle are used as a confirmation check in utterances such as *no mo job fo you, aeh*? 'There isn't a job for you, right?'

Despite the lack of written norms, standardization, or any official recognition, there are nevertheless some writers who have attempted to use the creole as a medium for poetry, short stories, and drama by adapting English spelling to represent some of the distinctive characteristics of speech varieties in Hawai'i. Each writer has worked out his or her own *ad hoc* spelling system. This burst of literary creativity can be seen partly as a manifestation of opposition to colonialism and as an affirmation of distinctive local identity in which the use of creole plays a key role.

Hayakawa, Samuel Ichiye (1906–1992)

M McCaskey, Georgetown University, Washington, DC, USA

© 2006 Elsevier Ltd. All rights reserved.

Samuel Ichiye Hayakawa, known in the academic world as the semanticist S. I. Hayakawa, was born a Canadian, in Vancouver, British Columbia, on July 8, 1906. He received his primary and secondary education in public schools, and completed his undergraduate education at the University of Manitoba. He obtained an M.A. degree in English from McGill University in Montreal in 1928. He entered the Ph.D. program in English at the University of Wisconsin in 1930, receiving his degree in 1935, and served as an English instructor there from 1930 to 1939.

Hayakawa's achieved a national reputation as an authority on semantics when his book *Language in thought and action* appeared in 1938. In 1933, the Polish-American pioneer in semantics, Alfred Korzybski (1879–1950), had published his complex seminal work, *Science and sanity: an introduction to non-Aristotelian systems and general semantics*. Hayakawa's book was a popular introduction to the basic analytical concepts developed by Korzybski and other early semanticists. The educated general public in America had begun to show an interest in semantics, and both Hayakawa's book, and *The tyranny of words,* another introduction to semantics by the popular public affairs writer Stuart Chase (1888–1985), became best sellers in 1938.

In 1939 Hayakawa went to Chicago, where he first taught at the Armour Institute, an engineering school, now the Illinois Institute of Technology. In 1943, Hayakawa founded the journal *ETC: A Review of General Semantics,* continuing to serve as its editor for over a quarter century, until 1970. He joined the English faculty at the University of Chicago in 1950, further enhancing his national reputation through a 13-week television series on semantics for National Educational Television. In 1954, he published *Language, meaning, and maturity,* a collection of his essays which had appeared in *ETC*.

In 1955, Hayakawa moved to San Francisco, becoming a professor at San Francisco State College, carrying on an active career as a lecturer and writer as well. In 1959, he published *Our language and our world*, another collection of essays published initially in *ETC*. Most of Hayakawa's subsequent books were collections of previously published essays on semantics by himself or others, with one notable exception. This was his *Guide to synonyms and related words,* a large-scale original English thesaurus of his own design. Originally published in 1968, it remains in print today as a basic reference work, Hayakawa's least well-known but most permanent scholarly achievement as a linguist.

On the basis of this achievement, as well as his national reputation as a writer and lecturer, Hayakawa was appointed president of San Francisco State in 1968 until his retirement in 1973. As president, he became even more widely known, but this time for his determined and well-publicized opposition to militant student activism on campus, which won him a growing following among California conservatives.

Retiring from the academic world in 1973, Hayakawa began a new career as a conservative

Hayyuj, Judah (10th Century)

A Kaye, California State University, Fullerton, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

Known in Arabic as Abu Zakariyya Yahya ibn Dawud and in Hebrew as Judah ben David Hayyuj, he can be called the first 'scientific' Hebrew grammarian. He was born around A.D. 940 in Fez, Morocco, and died around 1010 in Cordoba, where he lived most of his life. Not very much is known about him; however, it is an established fact that he left Morocco to study in Cordoba in 960 under one of the leading grammarians of this era, Menahem ibn Jacob ibn Saruq.

Hayyuj was the first Hebrew grammarian to demonstrate that Hebrew was analyzable as having a system of triconsonantal roots. Writing almost entirely in Judeo-Arabic, he was able to establish the principle of root triconsonantality because he had an excellent knowledge of Arabic, in which the triconsonantal root is more conspicuous than in Hebrew. Indeed, the facts of Arabic morphology had been known long before Hayyuj's writings.

Hayyuj is famous for an important rejoinder (Stern, 1967–1968) to Dunash ibn Labrat, a pupil of Sa'adyah Gaon's, who sided with Hayyuj's mentor, Menahem ibn Jacob ibn Saruq. This was penned in Hebrew, along with those of two other pupils of Ibn Saruq's: Isaac ibn Kapron and Isaac ibn Gikatilla. Abraham ibn Ezra translated some of Hayyuj's works into Hebrew for a wider dissemination and referred to him as "the first of grammarians" (Hirschfeld, 1926: 35). Shmuel ibn Nagrela (Hanagid), the Minister of State under King Habus of Granada, was Hayyuj's student. When the Umayyads in Cordoba were defeated by the Berbers, the Hebrew Academy of Cordoba was destroyed and its members were forced to flee. Hayyuj went to Murcia and afterward Valencia.

Among Hayyuj's works, the following are most noteworthy: *Kitab al-Tanqit* or *Kitab al-Nuqat* (*The book of vocalization or punctuation*, translated into Hebrew as *Sefer Haniqud* [*The book of vocalization*] by Abraham ibn Ezra), which deals with vocalic changes caused by the addition of suffixes, mainly in the noun, as well as the tonic syllable, especially in segholate nouns; *Kitab al-'Af'al Dhawat Huruf al-Lin* (*The book of hollow verbs*), which deals with verbs whose middle radical is *waw* (<w>) or *yodh* (<y>), such as Hebrew *qaam* 'he got up' = Arabic *qaama*; *Kitab al-'Af' al Dhawat al-Mathalayn* (*The book of reduplicated or geminated verbs*), which discusses those verbs whose second and third radicals are identical, such as *sbb* 'to surround'; *Kitab al-Nutaf* (*The book of plucked feathers*), which is incomplete but deals with the difficult passages, the vocabulary, and the importance of the *meteg* and other accent marks in parts of the Old Testament, such as Joshua, Judges, Kings, Jeremiah, Ezekiel (Basal, 2001); a large fragment housed in St Petersburg and published with other fragments in Russian by Professor Paul Kokovzov in 1916, known as *The book of notes*, which offers grammatical commentary on Kings I and II, Isaiah, Jeremiah, and Ezekiel.

Hayyuj's works were studied throughout the Middle Ages in the *Sefer Hayyuj* (*The book of Hayyuj*),

newspaper columnist and politician. He was elected as a Republican U.S. senator from California, serving from 1977 until 1983. He then retired from the Senate, but still remained active as the leader of a movement known as U.S. English, advocating the retention of English as the sole official language of the United States. Head Feature Principle and Feature Distribution Constraints

D J Arnold, University of Essex, Colchester, UK

© 2006 Elsevier Ltd. All rights reserved.

Intuitively, the 'Head' of a phrase is the element that 'gives the phrase its grammatical character.' In the clearest cases (e.g., the preposition in a PP, the verb in a VP), most of the grammatical properties of the phrase are predictable from the properties of the Head (for example, its distribution, internal makeup, and semantics). Perhaps not all phrases contain such an element (problematic cases include coordinate structures and 'mixed categories' such as gerunds), but the idea that at least some do is very widely accepted. It has its roots in the traditional idea that phrases typically contain a word that 'governs' other elements, and the Bloomfieldian idea of 'endocentric' phrases – phrases that belong to the same form class as one of their elements. In one form or another, it plays a central role in essentially every modern grammatical theory (see, e.g., Corbett *et al.*, 1993).

As with other grammatical roles such as Subject and Object, one may take the notion of Head to be either a theoretical primitive, or not. In the latter case, one may define the Head to be the element of a phrase that has certain properties in common with the phrase as a whole (e.g., as the X in XP). This is the approach taken in X-bar Theory (*see* **X-Bar Theory**). If on the other hand the notion Head is taken to be a theoretical primitive, some sort of principle is required that will ensure the appropriate sharing of properties between Heads and phrases – some sort of Head Feature Principle (HFP). The purpose of this article is to give a brief and informal outline of how this and similar principles can be used in the description of grammatical phenomena.

The scope and value of these principles is best appreciated in the context of Constraint-Based frameworks with well developed feature theories, where the properties of phrases are represented as sets of features (i.e., sets of attribute-value pairs, where values may themselves be sets of features). One example of such a framework is HPSG (e.g., Pollard and Sag, 1994; Sag and Wasow, 1999), which will provide the basis for the discussion here. In this setting, the properties that are common to Heads and Mothers appear in the value an attribute HEAD, and the HFP can be stated simply as something like 'in a headed phrase, the value of HEAD on the Mother must be shared with that on the Head daughter' (nonheaded phrases would include coordinate structures, for example). If a 'tag' such as $\boxed{1}$ is used to represent the occurrence of a single value in different locations, then (assuming binary branching) the effect of the HFP can be taken as ensuring that rules describing headed constructions will be of the form (1a) or (1b), and trees representing headed constructions will be of the form (2a) or (2b), where the Head daughter is marked *H*.

(1a) $[HEAD\ \boxed{1}] \rightarrow XP\ [HEAD\ \boxed{1}]$

(1b) $[HEAD\ \boxed{1}] \rightarrow [HEAD\ \boxed{1}]\ XP$

(2a)

Head Feature Principle and Feature Distribution Constraints

D J Arnold, University of Essex, Colchester, UK

Intuitively, the 'Head' of a phrase is the element that 'gives the phrase its grammatical character.' In the clearest cases (e.g., the preposition in a PP, the verb in a VP), most of the grammatical properties of the phrase are predictable from the properties of the Head (for example, its distribution, internal makeup, and semantics). Perhaps not all phrases contain such an element (problematic cases include coordinate structures and 'mixed categories' such as gerunds), but the idea that at least some do is very widely accepted. It has its roots in the traditional idea that phrases typically contain a word that 'governs' other elements, and the Bloomfieldian idea of 'endocentric' phrases – phrases that belong to the same form class as one of their elements. In one form or another, it plays a central role in essentially every modern grammatical theory (see, e.g., Corbett *et al.*, 1993).

As with other grammatical roles such as Subject and Object, one may take the notion of Head to be either a theoretical primitive, or not. In the latter case, one may define the Head to be the element of a phrase that has certain properties in common with the phrase as a whole (e.g., as the X in XP). This is the approach taken in X-bar Theory (*see* **X-Bar Theory**). If on the other hand the notion Head is taken to be a theoretical primitive, some sort of principle is required that will ensure the appropriate sharing of properties between Heads and phrases – some sort of Head Feature Principle (HFP). The purpose of this article is to give a brief and informal outline of how this and similar principles can be used in the description of grammatical phenomena.

The scope and value of these principles is best appreciated in the context of Constraint-Based frameworks with well developed feature theories, where the properties of phrases are represented as sets of features (i.e., sets of attribute-value pairs, where values may themselves be sets of features). One example of such a framework is HPSG (e.g., Pollard and Sag, 1994; Sag and Wasow, 1999), which will provide the basis for the discussion here. In this setting, the properties that are common to Heads and Mothers appear in the value an attribute HEAD, and the HFP can be stated simply as something like 'in a headed phrase, the value of HEAD on the Mother must be shared with that on the Head daughter' (nonheaded phrases would include coordinate structures, for example). If a 'tag' such as $\boxed{1}$ is used to represent the occurrence of a single value in different locations, then (assuming binary branching) the effect of the HFP can be taken as ensuring that rules describing headed constructions will be of the form (1a) or (1b), and trees representing headed constructions will be of the form (2a) or (2b), where the Head daughter is marked *H*.

(1a) $[HEAD\ \boxed{1}] \rightarrow XP\ [HEAD\ \boxed{1}]$

(1b) $[HEAD\ \boxed{1}] \rightarrow [HEAD\ \boxed{1}]\ XP$

(2a)

(2b)

This allows a wide range of grammatical phenomena to be succinctly described. For example, suppose Number is treated as a Head feature of nouns and determiners. Given the HFP, a very simple account of determiner–noun agreement (see (3)) is possible: we simply require determiner phrases and associated $\overline{\text{N}}$s to have the same value (i.e., 'agree') for Number. The effect of this can be seen in (4a). The HFP ensures (a) that the same HEAD value ($\boxed{2}$) appears on DETP and DET, and (b) that a possibly different HEAD value ($\boxed{3}$) is shared between N, $\overline{\text{N}}$, and NP (possibly different, that is, except in the value of NUM). Notice that, as a result, DET and N are required to have the same specification for Number, from which follows the contrast in grammaticality between (3a) and (3b), since in the latter *this* is singular and *descriptions* is plural. In conjunction with the lexical information that *descriptions* and *these* are plural (pl), this gives (4b), where, redundantly, the values associated with tags have been spelled out everywhere, and where for readability, traditional category labels are shown on the nodes – presumably at least part of the information expressed by these labels should be coded in features (e.g., CAT:n, CAT:det), which are subject to the HFP.

(3a) These descriptions of the problem [are very useful].
(3b) *This descriptions of the problem [are very useful].

(4a)

(4b)

It is often natural and convenient to talk as though principles such as the HFP involved percolation of features up and down trees (e.g., to talk about plural marking 'percolating up' or 'projecting' from N to $\overline{\text{N}}$ and NP in (4b)). It is worth stressing that in the current context this is just a way of speaking: the HFP, and other principles on the distribution of features discussed here, are entirely nondirectional.

Once the basic idea of a principle such as the HFP is appreciated, the idea can be adapted to provide an account of a wide range of phenomena. I will exemplify two: lexical subcategorization (Complement selection), and Long-Distance Dependencies.

A verb such as *gave*, as in *Sam gave them to charity*, selects two Complements: an accusative NP and a PP marked with *to*. Suppose such information is represented lexically in a 'Complement list,' the value of a COMPS attribute. One way of implementing Complement selection involves removing elements from this list as a phrase is formed by combining a Head with a Complement. From a bottom-up perspective, Complements are 'canceled' from the COMPS list as phrases are built up. See (5). The particular requirements of *gave* can be expressed by stating that the first element of its COMPS list ($\boxed{1}$ in (5)) is CAT:n and CASE:acc, and that the second is CAT:p and PFORM:to. (If these are HEAD features, the HFP will ensure that they percolate down to the Heads of NP and PP, so that, for example, the nominal Head of the NP will be accusative, and the P in PP will be specified as PFORM:to, ensuring that the PP Complement is indeed Headed by *to*). A top-down perspective on this would be that Complements are added to the COMPS list as the tree grows downward, and only a verb lexically specified as allowing such Complements can be inserted under the bottom VP node.

(5)

Of course, not all properties of Complements are available for selection by Heads (e.g., Heads are generally assumed not to select for phonological properties of Complements). If the 'selectable' properties are grouped under a feature (e.g., 'SYNSEM'), then the principle governing the distribution of the COMPS feature would be something along the lines of: '(in a headed structure) the COMPS value on the mother is

the COMPS value on the Head daughter, less the SYNSEM value of the Complement daughter,' or equivalently, 'the COMPS value on the Head daughter is the COMPS value on the mother, plus the SYNSEM value of the Complement daughter.'

In combination, the HFP and this 'COMPS principle' produce a radical simplification of the grammar. Essentially all Head-Complement constructions can be described in the very general form of either (6a) or (6b). The HFP takes care of appropriate choice of Head and Mother, the 'COMPS principle' ensures compatibility of Complement and Head.

(6a) $M \rightarrow H\ C$
(6b) $M \rightarrow C\ H$

The COMPS Principle is one instance of a principle that can be thought of as projecting information from the Head. Straightforward variations would deal with selection of Subjects and Specifiers by Heads. These separate principles could be collapsed into one Valence Principle, roughly: 'For any Valence feature V, the value of V on the Mother is the value of V on the Head, less the SYNSEM value of the V daughter.' A somewhat different projection principle would deal with semantic content. Leaving aside the issue of quantifier scope, in Head-Complement constructions the semantic content of the phrase is normally projected from the Head (i.e., the Head is interpreted as a functor applied to the contents of the Non-Head). Notice, however, that such a principle of feature distribution must be parameterized for different construction types. For example, in Head-adjunct constructions it is generally the adjunct that supplies the semantic functor, so here semantic content projects from the Non-Head.

There are also feature distribution principles that generally involve Non-Heads. For example, the principle governing the distribution of features used in many Constraint-Based approaches to describe Long-Distance (unbounded) Dependencies (LDDs) such as that between preposed Wh-elements ('fillers') and gaps in questions, relative clauses, etc.

(7a) I wonder [[who$_i$] [(he thinks) she longs for Δ_i]]
(7b) I wonder [[for whom$_i$] [(he thinks) she longs Δ_i]]

The idea here is that phrases are marked with a feature (SLASH) whose value indicates the properties of any gaps they contain. This feature is passed down via to the daughters of the phrase to the 'extraction site' (gap position). Since many languages allow multiple extractions, it seems clear that the value of SLASH should be a set. The elements of the set should contain all the information that is shared between the filler and the gap position. As a first approximation, the SLASH value on the mother should be union of the values on the daughters.

(8)

This ignores two special cases – the 'top' and 'bottom' of the dependency. The bottom of the dependency is easily dealt with, either by having a (phonologically null) lexical item that can function as a 'null Complement' in the gap position, or by having a principle that allows Heads to satisfy their complementation requirements using either overt Complements or elements of SLASH. The top is more problematic: it is important that the SLASH value corresponding to a gap does not percolate higher than the corresponding filler. Notice, moreover, that not all LDDs involve an overt filler. In a cleft construction like (9) *Kim* corresponds to the indicated gap, but it is not a filler (it is the Complement of *be*).

(9) It is Kim$_i$ [(that) she admires Δ_i]

The general solution is to have another set valued feature (often called TO-BIND), which will contain elements that are to be removed from SLASH: the value of SLASH on the mother should be the union of values on the daughters less the elements of this set. In the case of cleft constructions, the lexical entry for *be* can specify that this set should contain a value corresponding to its Complement; similarly, rules that deal with questions and relative clauses can ensure that the SLASH element corresponding to the filler is an element of the TO-BIND set of the Head, so that the SLASH value associated with the gap will not percolate beyond the construction.

Again, this approach can be extended and generalized to a Non-local Feature Principle (NFP) covering other features involved in LDDs – notably to the projection of features from relative and interrogative pronouns that permit phrases containing such pronouns to appear initially in English relative clauses and questions (e.g., *for whom* in (7b), the phenomenon of 'pied-piping'). Similar techniques can be used to deal with Quantifier Scope (along the lines of Cooper Storage (Cooper, 1983) see, e.g., Pollard and Sag, 1994).

The perspective of this discussion has been essentially that of HPSG (e.g., Pollard and Sag, 1994; Sag and Wasow, 1999), but these principles have their roots in earlier frameworks (notably GPSG (Gazdar *et al*., 1985) for the HFP and the approach to nonlocal dependencies, JPSG (Gunji, 1987) for the approach to Complement selection), and have equivalents in other frameworks – for example, in LFG (Kaplan and Bresnan, 1982; Bresnan, 2001), an $\uparrow = \downarrow$ annotation appears on the Head element in c-structure rules, identifying the f-structures of the Head and the Mother as in the HFP (different techniques are used for Complement selection and Long-Distance Dependencies).

There are of course many questions about the precise formulation of principles such as these, and about the their use in the analysis of particular languages and constructions (e.g., what features should be HEAD, SLASH, or SYNSEM features), but the principles themselves are not very controversial in general. It is rather the more fundamental assumptions that are controversial – such as whether 'feature percolation' is appropriate for the description of phenomena like Complement selection and LDDs, and what role the notion 'Head' should play in grammatical theory. However, a number of issues concerning these principles deserve mentioning as topics of on-going discussion (e.g., in the Proceedings of HPSG conferences: Müller, 2003; Kim and Wechsler, 2002; Van Eynde *et al*., 2001). One concerns the scope of the HFP. Suppose, for example, that instead of SLASH values being combined on the Mother, they are combined on the Head. They could then be percolated to the Mother by the HFP. There might perhaps be empirical advantages to this, and it might seem conceptually more attractive, emphasizing as it does the central role of the Head in grammatical constructions. A related issue is whether these principles should be 'strict' or hold only by default (see e.g., Ginzburg and Sag, 2001). Finally, a rather striking characteristic of these principles is their formal simplicity: they involve only statements of identity and very simple operations on lists and sets. It is an open question whether more complex operations might be required (for example in the analysis of coordinate structures where properties of the whole construction appear to depend on properties of the parts in rather complex ways).

Grammar (LFG; Bresnan, 1982), a revived, empirically based version of Categorial Grammar (CG, Ades and Steedman, 1982), and several other approaches all made their appearance, and HPSG has integrated ideas from each of these paradigms, in combination with insights developed in the Government and Binding (GB; Chomsky, 1981) paradigm.

Fundamentals of the Linguistic Framework

HPSG rests on two essential components: (i) an explicit, highly structured representation of grammatical categories, encoded as typed feature structures, whose complex geometry is motivated by empirical considerations against the background of theoretical desiderata such as locality, and (ii) a set of descriptive constraints on the modeled categories expressing linguistic generalizations and declaratively characterizing the expressions admitted as part of the natural language. The formal foundation of this architecture is discussed in a separate section below.

From a linguistic perspective, the set of descriptive constraints expressing the theory of an HPSG grammar consist of (a) a lexicon licensing basic words, (b) lexical rules licensing derived words, (c) immediate dominance schemata licensing constituent structure, (d) linear precedence statements constraining constituent order, and (e) a set of grammatical principles expressing generalizations about linguistic objects. The clearest way to illuminate the interaction of these components is to provide a concrete example.

Lexical Organization Consider the verb *put*, for which a partial lexical entry is shown in Figure 1.

As specified by the type in the top-left corner of Figure 1, this Attribute-Value Matrix (AVM) describes objects of type *word*. The PHON attribute here is simply taken to be a list of strings serving as a placeholder for an actual phonological representation for HPSG, as developed by Bird and Klein (1994) and Höhle (1999). The morphosyntactic information that characterizes local properties of linguistic expressions are specified under the CATEGORY feature, which, along with the semantic CONTENT, is identified by the LOCAL part of the SYNSEM value. The subset of CATEGORY properties that are necessarily shared between mother and head daughter in a local tree are packaged together under the HEAD feature.

$$\begin{bmatrix} \textit{word} \\ \text{PHON} \ \langle \textit{put} \rangle \\ \text{SYNSEM|LOCAL} \begin{bmatrix} \text{CATEGORY} \begin{bmatrix} \text{HEAD} \begin{bmatrix} \textit{verb} \\ \text{AUX} \ - \end{bmatrix} \\ \text{VALENCE} \begin{bmatrix} \text{SUBJ} \ \langle \textit{NP} \ \boxed{1} \rangle \\ \text{COMPS} \ \langle \textit{NP} \ \boxed{2}, \textit{PP} \ \boxed{3} \rangle \end{bmatrix} \end{bmatrix} \\ \text{CONTENT} \begin{bmatrix} \textit{put-relation} \\ \text{PUTTER} \ \boxed{1} \\ \text{THING-PUT} \ \boxed{2} \\ \text{DESTINATION} \ \boxed{3} \end{bmatrix} \end{bmatrix} \end{bmatrix}$$

Figure 1 A basic lexical entry.

The VALENCE feature specifies the combinatory potential of lexical items as lists of *synsem* objects (as opposed to lists of *signs*). Thus, neither phonological information (specified in PHON) nor the DAUGHTERS feature, which, as we will see, encodes constituent structure in objects of type *phrase*, can be selected for, incorporating the well-supported generalization that syntactic selection is independent of phonological form and is consistently local.

The specification of the valence features (SUBJ and COMPS) and CONT, specifying the semantic roles assigned by the head, make it possible to lexically associate the valents of a head with the semantic contribution of these valents to the relation it denotes. The boxed numbers indicate token-identity of the values specified. Instead of specifying such linking in each lexical entry, it can be derived from general linking principles (cf. Koenig and Davis, 2003, and references therein). The issue of lexical generalizations brings us to the question how the lexicon is defined.

The basic lexicon of an HPSG theory can be defined by the *Word Principle* shown in Figure 2, where each *Lexical-Entry* is a description of the kind we saw in Figure 1.

Whereas this principle illustrates the basic method for expressing a lexicon as a constraint, a wide range of approaches have been developed that do not take lexical entries of type *word* as primitives, such as realizational approaches to morphology (cf., e.g., Erjavec, 1996; Riehemann, 1998) or word syntax approaches (cf., e.g., Krieger and Nerbonne, 1993). The HPSG architecture also readily supports lexical generalizations through principles expressing constraints on sets of lexical elements, so-called *vertical generalizations*, as well as through lexical rules expressing relations between sets of lexical elements, referred to as *horizontal generalizations* (cf. Meurers, 2001; Bouma *et al.*, 2000, and references cited therein).

Phrasal Structures Turning to phrasal structures, consider the tree shown in Figure 3 (note that S, NP, VP, etc., are just abbreviations for AVM specifications; for space reasons, some attribute names are also abbreviated).

$$\textit{word} \rightarrow \textit{Lexical-Entry}_1 \vee \textit{Lexical-Entry}_2 \vee \ldots \vee \textit{Lexical-Entry}_n$$

Figure 2 The word principle.

As with all grammatical principles in HPSG, generalizations over phrasal structure are expressed as constraints. Figure 4 shows the relevant parts of the Immediate Dominance (ID) Principle, which essentially encodes a version of the X-bar schema (Jackendoff, 1977).

The first disjunct of the ID Principle is the Head-Subject schema, which licenses the upper local tree of the example in Figure 3; the lower local tree is licensed by the Head–Complement schema.

In addition to the Head–Subject and the Head–Complement structure licensed by the two disjuncts shown, Pollard and Sag (1994) assume only a small inventory of general schemata: Head–Adjunct, Head–Filler, Head–Marker, and a flat Head–Subject–Complement schema.

The subcategorization requirements specified under the VALENCE attribute in the lexical entry of *put* are realized as the result of the Valence Principle, which specifies that the valence requirements of a lexical head are identified with the SYNSEM value of the realized daughters, with all unrealized requirements being handed on to the mother of the local tree. This principle essentially is the phrase-structural analogue to Categorial Grammar's treatment of valence satisfaction as combinatory cancellation (though, unlike CG, HPSG's principle does not assume that all valence-driven combinations involve a functor combining with a single argument). In the example in Figure 3, we can see that the valence specification in the lexical entry of *put* requires an NP subject and two complements, an NP and a PP. In the lower tree, the two complements are realized as *a book* ($\boxed{5}$) and *on the table* ($\boxed{6}$). As a result of the Valence Principle, the VP mother of that local tree has an empty COMPS requirement. The SUBJ requirement is inherited unchanged from the lexical verb and realized as *John* ($\boxed{4}$) in the higher local tree, dominated by the fully saturated S.

The percolation of head information along the head projection is the result of the Head-Feature Principle (HFP), shown in Figure 5. The HFP is a straightforward adaptation of the Head Feature Convention of Gazdar *et al.* (1985); it ensures that in any headed structure, the HEAD specifications of a mother and its head daughter are token-identical. In our example in Figure 3, the category *verb* and the [AUX –] specification are shared as index $\boxed{7}$ between the lexical head *put* and its VP and S projections.

Figure 3 An example for a phrasal construction.

Capturing Dependencies

Arguably the essential test of a grammatical framework is its ability to capture, parsimoniously and inclusively, the ubiquitous grammatical dependencies of natural languages. Such dependencies are often grouped into two major classes: *local dependencies*, which hold over a limited syntactic domain and frequently depend on properties of a specific class of lexical items, and *nonlocal dependencies*, which appear to hold over arbitrarily large syntactic distances and are largely independent of the lexicon. In this section, we briefly review, mostly based on Pollard and Sag (1994), how the machinery available in HPSG leads to compact solutions to the problems posed by both dependency types in English.

Local Dependencies Phenomena such as agreement, auxiliary-choice morphosyntactic dependencies, subject selection, the active/passive relationship, and the so-called Raising/Equi constructions all exemplify what we refer to as local dependencies. In HPSG, these phenomena typically are all handled in terms of the selectional properties of lexical heads. We here sketch the analysis of control constructions as an illustration of this general approach.

Control Construction In line with the general HPSG strategy to reject those invisible elements for which there is no empirical evidence, in nonfinite constructions, the subject of the embedded verb is analyzed as not locally expressed. There is no need to assume an invisible realization of such subjects, as done in transformational grammar, since HPSG is based on richer linguistic data structures in which lexical specifications, such as subcategorization requirements, are explicitly represented. The questions of what is interpreted to be the subject of the nonfinite verb and why verbs selecting nonfinite complements differ with respect to what kind of controllers can occur are thus answered through the lexical specification of the control verbs.

A subject-to-subject raising verb like *seem*, for example, will have the partial description in the lexicon given in Figure 6. We see that the subject valence requirement of the subject raising verb is identified with the subject of the verbal complement. Note that the subject is not assigned a semantic role by the raising verb. In order to derive the fact that such raising is permissible only if the raised argument is assigned a semantic role elsewhere in the structure, Pollard and Sag (1994: 140) specified a general metaprinciple, the Raising Principle.

$$\begin{bmatrix} \textit{phrase} \\ \text{DTRS } \textit{headed-struc} \end{bmatrix} \rightarrow \begin{bmatrix} \text{SYNSEM|LOC|CAT} & \begin{bmatrix} \text{HEAD} & \left(\begin{bmatrix} \textit{verb} \\ \text{INV} & - \end{bmatrix} \vee \neg\, \textit{verb} \right) \\ \text{VAL} & \begin{bmatrix} \text{SUBJ} & \langle\rangle \\ \text{COMPS} & \langle\rangle \end{bmatrix} \end{bmatrix} \\ \text{DTRS} & \begin{bmatrix} \textit{head-subj-struc} & \\ \text{HEAD-DTR} & \textit{phrase} \\ \text{SUBJ-DTR} & \textit{sign} \end{bmatrix} \end{bmatrix} \quad \text{(Head-Subject)}$$

$$\vee \begin{bmatrix} \text{SYNSEM|LOC|CAT} & \begin{bmatrix} \text{HEAD} & \left(\begin{bmatrix} \textit{verb} \\ \text{INV} & - \end{bmatrix} \vee \neg\, \textit{verb} \right) \\ \text{VAL} & \begin{bmatrix} \text{SUBJ} & \langle \textit{synsem} \rangle \\ \text{COMPS} & \langle\rangle \end{bmatrix} \end{bmatrix} \\ \text{DTRS} & \begin{bmatrix} \textit{head-comps-struc} & \\ \text{HEAD-DTR} & \textit{word} \end{bmatrix} \end{bmatrix} \quad \text{(Head-Complement)}$$

$$\vee \ldots$$

Figure 4 Immediate Dominance Principle.

$$\begin{bmatrix} \textit{phrase} & \\ \text{DTRS} & \textit{headed-structure} \end{bmatrix} \rightarrow \begin{bmatrix} \text{SYNSEM|LOC|CAT|HEAD} & \boxed{1} \\ \text{DTRS|HEAD-DTR|SYNSEM|LOC|CAT|HEAD} & \boxed{1} \end{bmatrix}$$

Figure 5 Head Feature Principle.

Based on the lexical specification in Figure 6, the properties of a raising verb fall out of the interaction with the rest of the architecture; in particular, the identification of the subject requirement of the two verbs implies that: If the embedded verb requires a nonreferential subject or permits a clausal subject, this is enforced by the raising verb realizing the subject. If the embedded verb has a subject with an idiomatic interpretation, the subject also has that interpretation when realized as an argument of a raising verb. In languages in which subjectless constructions exist, raising verbs can embed such subjectless complements. And passivization of the nonfinite complement results in a paraphrase.

In contrast, the partial lexical specification of a subject-to-subject equi verb like *try* in Figure 7 specifies semantic coindexing of the subject valence requirement of the subject control equi verb with the subject of the verbal complement. And the subject is assigned a semantic role by the subject control equi verb.

Nonlocal Dependencies Probably the strongest-seeming case for syntactic transformations was the existence of unbounded dependencies, particularly extraction phenomena. Given that certain valence requirements appear to be satisfied by elements arbitrarily distant from the selecting head, it is intuitively natural to suppose that they were moved there after selection. A derivational account thus seems attractive, even under the antitransformational stances evident in, e.g., Brame (1976).

The flaws in this line of thinking were made obvious in Gazdar's (1981) pioneering work on an explicit formal characterization of filler/gap linkages in a monostratal framework, which was assimilated into a feature-based account by Bear (1981) and Gazdar *et al.* (1985). In HPSG, the relevant feature is the set-valued SLASH, which takes as its value the LOCAL specifications of extracted elements.

The Filler–Head schema licenses the local tree realizing the filler as illustrated in Figure 8.

The Nonlocal Feature Principle has the effect of sharing the SLASH value of the mother with that of some daughter until it reaches the trace, which has the lexical entry shown in Figure 9. This entry identifies the properties of the nonlocally realized element specified under SLASH with its own LOCAL specification.

Taken together, the lexical entry and the general principles yield a structure for a sentence such as *What do you think Robin said?* as in Figure 10.

Figure 6 Partial lexical entry for a raising verb.

Figure 7 Partial lexical entry for an equi verb.

Figure 8 The local tree realizing the filler of a nonlocal dependency.

Note that *pace* Baker (1978), apart from the schema realizing the filler, the sentence is licensed by the same general ID schemata also used in nonextraction examples.

Independent support for the inherently local propagation of SLASH feature specifications as the vehicle for UDC dependencies comes from work on languages that visibly mark filler/gap pathways, as discussed at length in Zaenen (1983) and Hukari and Levine (1995). Such languages record by morpho- or phonosyntactic means the presence of each intermediate clausal step along the filler/gap pathway.

Other Dependencies In addition to the local and nonlocal dependencies, so-called middle distance dependencies arise in the context of coherence/verb-raising in the Germanic languages and of restructuring phenomena in the Romance languages – an issue we return to briefly in the next section when discussing argument attraction as the lexical specification underlying an analysis of these phenomena.

Finally, another kind of dependency relation, treated in considerable detail in Pollard and Sag (1992, 1994), involves the syntactic conditions that require, allow, or forbid coindexation of referring constituents. These conditions, collectively referred to as the HPSG Binding Theory, are formulated in HPSG not in terms of syntactic configuration but rather in terms of an obliqueness ordering that is lexically specified as a part of the selection properties.

Strands of Research

During the past decade, a vast literature in the HPSG framework has addressed empirical and theoretical issues arising in a wide range of languages. The scale of the enterprise allows only the most cursory overview; interested readers will find many of these issues taken up in breadth and detail in Kathol and Przepiórkowski (in press) and extensive on-line bibliographies of HPSG literature.

Beginning with the crosslinguistic breadth of coverage, a large collection of volumes has been devoted to the analysis of Romance languages (cf., e.g. Balari and Dini, 1997; Monachesi, 1999; Crysmann, 2003; Abeillé and Godard, 2003), Slavic languages (cf., e.g. Borsley and Przepiórkowski, 1999), German (cf., e.g. Nerbonne *et al.*, 1994; Kiss, 1995; Kathol, 2000; Müller, 1999, 2002; Meurers, 2000; Meurers and Kiss, 2001; Holler, 2001; De Kuthy, 2002). Japanese, (cf., e.g. Iida, 1995) Welsh, (cf., e.g. Borsley and Jones, 2005), and dozens of other languages. In addition, innumerable articles in journals, conference proceeding, and collections address the relevance of HPSG analyses to an understanding of complex phenomena in a variety of languages.

Figure 9 Lexical entry for elements not locally realized.

A good example of the latter is the analysis of clause union and restructuring phenomena in terms of argument attraction (Hinrichs and Nakazawa, 1994), which has had significant impact on analyses of languages as diverse as French and Korean. Similarly, the linearization-based approach to discontinuous constituency first proposed as a key to reconciling German constituent structure with the facts of word order in that language (Reape, 1996; Kathol, 2000; Müller, 1999) has been widely applied to problems of discontinuity in a variety of construction types in English, French, Portuguese Japanese, and Warlpiri. Another example is the introduction of a limited degree of nonlocality of selection into HPSG as a result of the work on case assignment in German reported in Meurers (2000: Chap. 10), which has proven useful in discussions of quite different phenomena, such as *tough* constructions in various languages (cf., e.g., Levine, 2001; Amaral, 2005).

Other work addresses questions of the grammatical architecture, such as the interaction of syntax, information structure, and intonation (Engdahl and Vallduví 1994; De Kuthy, 2002; De Kuthy and Meurers, 2003), and the integration of a range of semantic architectures into HPSG, such as Underspecified DRT (Frank and Reyle, 1995), Minimal Recursion Semantics (Copestake *et al.*, in press), Constraint Language for Lambda Structures (Egg *et al.*, 2001), and Lexical Resource Semantics (Richter, 2004a), which support innovative analyses of long-standing natural language puzzles, such as those posed by idioms (Sailer, 2003).

As should be expected of an active research community, the HPSG paradigm also includes significant diversity and disagreement about research strategies and analyses. One such issue concerns the choice between lexical and constructional approaches. Pollard and Sag (1994) account for the complex

Figure 10 An example for a nonlocal dependency.

properties of relative clauses using null functional heads; Sag (1997) instead essentially revived the treatment of these adjuncts in Gazdar *et al.* (1985) by proposing to account for their behavior in terms of constructional characteristics inherited in a complex type hierarchy from supertypes. This approach has been further explored in Ginzburg and Sag (2001) and other work that increasingly links certain quarters within HPSG to the program of Construction Grammar (Fillmore and Kay, 1999). There is no consensus within HPSG that this is the optimal move, however, and research that minimizes reliance on structural types continues to emphasize the head-driven, lexical aspect of HPSG (cf., e.g., Müller, 2005). In a directly related issue, two principal strands of HPSG have developed with respect to the use of types. In one strand, new types are introduced for any class of objects to be generalized over and these types are arranged in large, crossclassifying taxonomies. The other strand emphasizes minimal linguistic ontologies in that new types are introduced only if they are necessary to refer to language properties that cannot otherwise be distinguished in the model (cf. Meurers, 2001; Koenig and Davis, 2003). Another source of diversity lies in the analysis of unbounded dependencies. Traceless versions of HPSG have been pursued in Pollard and Sag (1994), Bouma *et al.* (2001), and Ginzburg and Sag (2001), but this line of analysis is not universally accepted (cf., e.g., Levine, 2003; Müller, 2002: Chap. 6.2.5.1).

The foregoing discussion, while inevitably very incomplete, should give the reader an idea of the creative ferment that has characterized HPSG over the past decade. Nor has this innovative momentum been confined to the empirical/analytic side; it has, as we discuss below, also made itself evident in the formal and computational aspects of the theory, to which we now turn.

HPSG from a Formal Perspective

A Declarative Characterization of Natural Languages

The first step of a scientific approach to any empirical subject is the modeling of the domain. Models of empirically observable objects are established to capture the relevant properties of those objects. The theories then make reference to these models and express generalizations about which of the potential models actually exist and how their properties relate.

Correspondingly, Head-Driven Phrase Structure Grammar as a scientific approach to language specifies every grammar to have two components: the signature and the theory (in a formal sense). The *signature* of an HPSG grammar defines the ontology ('declaration of what exists'): which kind of objects are distinguished and which properties of which objects are modeled. It consists of the type hierarchy and the appropriateness conditions, defining which

Figure 11 An example for token identity.

type has which appropriate attributes with which appropriate values. The *theory* of an HPSG grammar is a set of description language statements, often referred to as the constraints. The theory essentially singles out a subset of the objects declared in the signature, namely, those that are grammatical. A linguistic object is admissible with respect to a theory if and only if it satisfies each of the descriptions in the theory and so does each of its substructures. In the following, we take a closer look at the two components of an HPSG grammar.

Modeling the Domain What do the mathematical structures used as models for HPSG theories look like, and how are they related to the linguistic objects? Pollard and Sag (1994: 8) required the HPSG architecture to use typed feature structures (TFS) as models of linguistic objects. More precisely, they argued for modeling types (vs. tokens) of total linguistic objects (as opposed to partial information about them) and therefore assumed the models to be totally well-typed and sort-resolved feature structures.

Here, totally well-typed means that (a) "what attribute labels can appear in a feature structure is determined by its sort; this fact is the reflection within the model of the fact that what attributes ... an empirical object has depends on its ontological category" (Pollard and Sag, 1994: 18) and (b) "every feature that is appropriate for the sort assigned to that node is actually present" (Pollard and Sag, 1994: 18). Sort-resolvedness requires that every node is assigned a most specific type as value. Note that *type* and *sort* are often used synonymously; the same is true for *attribute* and *feature*.

It is important to realize that these requirements are not merely technical stipulations; they are a direct consequence of the decision that feature structures should serve as total models of linguistic objects. It is not uncontroversial within the HPSG community whether total models of linguistic objects are what is needed for linguistics. Problems for such total models arise in the analysis of coordination (Pollard and Sag, 1994: 203, fn. 39; Sag, 2003) and arguments for and against total models arise from the formalization of lexical rules and the representation of unrealized arguments (Meurers, 2001: 180–182; Pollard, 2001). At the same time, we will see in the next section that only total models support the classical negation needed for formulating the implicational constraints standardly used to express grammatical principles in HPSG.

Expressing the Theory Having clarified how linguistic objects are modeled, we can turn to the question of how to express the theory and how the theory characterizes the set of well-formed linguistic objects.

An HPSG theory is specified using a specific description language, sometimes written down in the form of *Attribute-Value Matrices* (*AVM*). The description language makes it possible to express that a feature structure has a certain type (e.g., *noun*), that the value of an attribute of a feature structure satisfies a given description (e.g., [CASE *nominative*]), or that the values of two attribute paths are *token identical*. Complex descriptions are obtained by combining descriptions with the help of conjunction, disjunction, and negation; in the AVM notation, conjunction is implicit.

The notion of token identity means that two paths point to the same node in the feature structure model; this is illustrated in Figure 11 with an AVM specifying token identity of HEAD values (as specified by the HFP discussed around Figure 5 above) and a small graph showing the relevant part of a feature structure denoted by this description.

Another identity notion sometimes referred to is *type identity*: Two feature structures are type identical if and only if they are of the same type, the same attributes are defined on both feature structures, and the feature structures that are the values of the attributes are type identical.

Turning to the second question, what does it mean for a theory to specify admissible feature structures? An HPSG theory simply is a set of descriptions that are interpreted as being true or false of a feature structure in the domain. A feature structure is admissible with respect to a certain theory if and only if it satisfies each of the descriptions in the theory and so

Figure 12 The setup desired in Pollard and Sag (1994).

Figure 13 The setup of Carpenter (1992).

does each of its substructures. The descriptions that make up the theory are also called *constraints*, since these descriptions constrain the set of feature structures that are admissible with respect to the theory compared to the domain of feature structures specified by the signature. Note that the term constraint has been used for many different purposes – we use 'constraint' only to mean 'description that is part of the theory.'

Formalizing the HPSG Setup

The setup of HPSG characterized in the previous section is summed up in Figure 12. The usual symbols for description language operators are used: conjunction (∧), disjunction (∨) and negation (¬). Type assignment and path equality are noted as '∼' and '=', respectively.

Several logics have been proposed to provide the formal foundations for this setup. There essentially are two families of logics dealing with this task: the *Kasper–Rounds* logics (Rounds and Kasper, 1986; Moshier and Rounds, 1987; Carpenter, 1992; Copestake, 1993) and the *Attribute-Value* logics (Johnson, 1988; Smolka, 1988; King, 1989). In the following, we focus on two prominent representatives in the context of HPSG: the Kasper–Rounds logic defined in Carpenter (1992) and the Attribute-Value logic of King (1989). Figure 13 shows the setup proposed in Carpenter (1992), with '≠' as notation for path inequality.

The descriptions of Carpenter (1992) describe typed feature structures modeling partial information. Presumably there is a further level, in which the partial information is related to the linguistic objects, which is left undefined. This setup can also be seen to underlie an early model of HPSG (Pollard and Sag, 1987). Since partial information, not total linguistic objects, is modeled, Carpenter (1992) did not require the typed feature structures to be well typed or sort resolved.

The difference between the total models of linguistic objects assumed in HPSG since Pollard and Sag (1994) and the models of partial information of Carpenter (1992) has important consequences. Moshier and Rounds (1987) showed that in the setup of a Kasper–Rounds logic, full classical negation as part of the description language destroys subsumption monotonicity on typed feature structures – a property that, as Carpenter and others argued, must be upheld if feature structures are to function as models of partial information. Carpenter (1992: Chap. 15, p. 233) went one step further by stating that even for the formulation of implicational constraints with type antecedents (i.e., type negation), subsumption monotonicity cannot be achieved. The description language of Carpenter (1992) therefore contains only path-inequations, a weaker form of negation.

Turning to Attribute-Value Logics, King (1994, 1999) showed that his Speciate Reentrant Logic (SRL) can provide the setup we saw in Figure 12, i.e., the setup envisaged for HPSG in Pollard and Sag (1994). Descriptions are given a set theoretic interpretation: The interpretation of a description is a set of objects, i.e., an object satisfies a description if and only if it is in the denotation of that description. For example, the description *word* denotes the set of all objects of type *word*; and the description [CASE *nominative*] denotes the set of all objects for which the partial function CASE is defined such that the value of that function is an object of type *nominative*. Conjunction, disjunction, and negation as operations on descriptions are interpreted as set intersection, set union, and set complement, respectively.

Although King's SRL captures the basic HPSG setup, one conceptual difference is that Pollard and Sag (1994) envisaged modeling ***abstract*** linguistic objects (i.e., types) whereas SRL models ***concrete*** linguistic objects (i.e., tokens). But Pollard (1999) distanced himself from the earlier emphasis on types and adopted King's denotation function in place of an approach based on feature structure satisfaction and admission.

King's SRL falls short, however, in failing to provide relational expressions. Richter (2000) addressed this issue by defining the Relational Speciate Reentrant Language (RSRL), which added a bounded form of quantification and relations to the inventory of expressions. He showed in detail how this formal language can provide a direct and transparent formalization of the English HPSG in Pollard and Sag (1994), which turns out to require more relations than was traditionally assumed. Richter (2000, 2004a) can also be recommended as a comprehensive overview of the complex issues involved in formalizing HPSG.

Processing with HPSG-Based Grammars

Motivation

There are at least three motivations for implementing and processing with HPSG-based grammars. From a *linguistic perspective*, such work can provide important feedback on the empirical adequacy of the linguistic analyses, on the explicitness, completeness, and compatibility of the linguistic theories integrated in one grammar, and on the rigid and complete formalization of the linguistic architecture. From a *computational perspective*, grammar implementation can stimulate and test the development of systems that support parsing and generation with HPSG-based grammars. Finally, from an *engineering perspective*, deep processing with HPSG-based grammars is potentially useful for applied human language technology as, e.g., illustrated by the speech-to-speech machine translation project VerbMobil.

Depending on the perspective adopted, research on HPSG-based processing has emphasized different issues; it is important to note, however, that even from an engineering perspective the value added by basing grammar writing on HPSG as a linguistic paradigm derives from the insights provided by an active linguistic research community. The development of implementation systems that support a transparent and tractable way of implementing a grammar close to the linguistic theory thus is of particular importance for HPSG-based computational work. In the same vein, a thorough documentation of grammars (cf., e.g., Meurers, 1994; Gregory, 1997; Müller, 1999), including discussions motivating the differences between the linguistic theory and the implementation, is an essential component of such work.

Frameworks for HPSG-Based Processing

Since the early 1990s, a range of systems that support processing with HPSG-based grammars have been developed. Classifying these systems according to the means used for expressing grammars, one can distinguish systems that are (a) constraint-based in the sense that grammars for these systems consist of implicational statements constraining the domain directly, (b) relation-based in the sense that they make use of a relational level for organizing the grammar, i.e., the relational extension of the constraint language, or (c) a combination of the two. We here focus on providing an overview of the key theoretical distinctions relevant for characterizing the different systems; a detailed system comparison can be found in Bolc *et al.* (1996).

Systems Directly Constraining the Domain The Typed Feature structure System (TFS; Emele and Zajac, 1990) arguably was the first system that supported a direct implementation of HPSG theories (cf., also, Matiasek, 1994). TFS grammars consist of a set of implicational statements with type antecedents. Any description can be entered as a query, and the system returns a more specific description such that the description and each of its parts satisfies each constraint in the theory.

The advantage of this approach is that the organization of constraints in TFS is the same as that in the HPSG architecture: an HPSG theory is just a set of constraints, some of which happen to constrain lexical objects, whereas others constrain phrasal objects, etc. The TFS system supports only implicational statements with type antecedent though, not general negation, so that principles with complex antecedents cannot be directly encoded.

In line with the credo for reversible processing architectures (cf. Van Noord, 1993; Neumann, 1998; Minnen, 2001, and references therein), processing in TFS always amounts to applying constraints to whatever specification is given as the input – there is no specialized parsing or generation algorithm. This also leads us to the main disadvantage of the TFS approach: Since every linguistic constraint is treated in the same way, including type constraints on recursively defined data structures, TFS can run into significant control problems, which result in problems of efficiency and termination.

Systems Based on a Relational Backbone In the Comprehensive Unification Formalism (CUF; Dörre and Eisele, 1991; Dörre and Dorna, 1993), a theory is expressed using definite clauses as a relational extension of the description language (cf. Jaffar and Lassez, 1987; Höhfeld and Smolka, 1988). CUF thus essentially is a relational programming language like Prolog (Colmerauer, 1993), but with feature terms as arguments of the relations instead of first-order terms. Whereas CUF provides some advanced features, such as complex coroutining capabilities, related approaches have focused on providing a lean integration of typed feature structures into Prolog such as GULP (Covington, 1994) or ProFIT (Erbach, 1995b).

An HPSG theory is implemented in such a setup by rewriting it as a logic program. In the resulting reorganized grammar, the recursive constraints are encoded on a different level (relations) than the linguistic data structure constraints (arguments to the relations). A query to the system is a call to one of the relations, and the system returns the instantiation of the arguments required for the called relation to hold. Whether such a query results in parsing or generation (or some other kind of processing)

depends entirely on how the grammar was encoded as a logic program and which processing regime is applied to it.

Compared to the computational setup exemplified by TFS, in which the constraints on the domain are expressed directly, the advantage of the relational approach is that the grammar writer determines the order of execution of goals by the way in which one encodes the grammar as a definite clause program. The definite clause encoding also allows the efficient processing techniques of logic programming to be used; e.g., clause indexing, Earley deduction, goal freezing, and specialized algorithms for parsing or generation can be encoded in this setup (cf., e.g., Erbach, 1995a, and references therein).

The disadvantage of the relational systems is that the organization and expression of a grammar are entirely different from the organization of an HPSG theory as a set of constraints. A grammar with a relational backbone in general is related to the original linguistic HPSG theory only on an intuitive level (unless the relational encoding is the result of compilation of a set of constraints; cf. Götz and Meurers, 1995).

Phrase Structure as a Specialized Relational Backbone Probably the largest class of systems, such as ALE (Carpenter and Penn, 1994), LKB (Copestake, 1993), and Troll (Gerdemann and Götz, 1996), has opted for a particular relational approach: phrase structure grammars. Phrase structure is a relation demanding a fixed number of daughters (at runtime) and having a designated argument (in HPSG typically encoded under PHON) that satisfies the condition that the list of tokens covered by the mother is the concatenation of that covered by all its daughters. The key advantage of a phrase structure-based approach is that the most important recursive structure, syntactic constituency, is singled out and encoded in a format that readily supports efficient algorithms for parsing. These algorithms exploit the formal properties of the phrase structure relation for efficient indexing, memoization, and other optimizations, instead of relying on resolution to tackle general definite clause programs. Some of the systems also make it possible to combine phrase structure grammars with definite clause programs, so that, e.g., a phrase structure rule can refer to a general definite relation for concatenating or shuffling lists.

The phrase structure-based approach shares the general disadvantage of the relational encoding: that the organization and formulation of the grammar are different from those of the linguistic theory. Despite its somewhat confusing name, a Head-Driven Phrase Structure Grammar does not include phrase structure rules; as we saw above, an HPSG theory is a set of constraints, one of which typically encodes a set of immediate dominance schemata licensing syntactic structure. When one recodes such immediate dominance schemata into phrase structure rules, the specific restrictions inherent to phrase structure mentioned above have the effect that each immediate dominance constraint of the original linguistic theory results in a possibly very large set of phrase structure rules.

Combining Paradigms

As mentioned in the previous section, a relational backbone is advantageous for efficient processing. In contrast, implicational constraints support a more modular, underspecified encoding of grammars by making use of the elaborate structure that typed feature structures impose on the modeled domain. Several HPSG-based processing systems have thus been developed to combine the advantages of both encodings, such as the (new) ALE (Carpenter and Penn, 1994), TDL (Krieger, 1995), ConTroll (Götz and Meurers, 1997), the (new) LKB (Copestake, 2002), Hdrug (van Noord and Bouma, 1997), or TRALE (Meurers *et al.*, 2002; Penn, 2004). This development is reminiscent of the integration of the paradigms of (constraint) logic programming, functional programming, and object-oriented programming in general-purpose programming languages, such as LIFE (Aït-Kaci and Podelski, 1991) and OZ.

How the paradigms are combined in the HPSG implementation systems differs from system to system, reflecting the linguistic or engineering focus under which they have been developed. Let us illustrate this with three examples:

The ConTroll system was developed to reflect the linguistic and formal architecture of HPSG as closely as possible. It supports interleaved processing of implicational constraints and relational expressions controlled through delay statements and prioritized deterministic computation (Götz and Meurers, 1997). The implicational constraints can have complex antecedents, and the system strictly enforces inferences based on the appropriateness conditions formulated in the signature (Gerdemann, 1995). Constraints are enforced lazily (Götz and Meurers, 1999) in a way that ensures that every description returned as a result has at least one instantiation that is most specific with respect to the signature defined, i.e., every solution returned by the system describes a nonempty set of linguistic objects. But the system lacks a phrase structure backbone for efficient processing with large-scale grammars.

At the other end of the spectrum, the LKB is a system emphasizing efficient processing with a phrase structure backbone and basic type constraints (Copestake, 2002). The system supports efficient processing of large-scale grammars and is at the heart of a rich array of natural language engineering efforts (cf., e.g., Oepen *et al.*, 2000, and several articles mentioned in the next section). In support of efficiency, the system has a lean design: The description language does not include disjunction, negation, path-inequation, or macros; the basic type constraints are not intended for recursive processing; and the system does not support definite relations so that recursive processing is limited to the phrase structure component. To avoid costly computation, constraints and appropriateness conditions are not strictly enforced, in the sense that a solution returned is not guaranteed to have any specific instantiations that are well-formed.

The TRALE system attempts to cover a middle ground by combining the definite relations and efficient phrase structure backbone of the ALE system (Penn and Munteanu, 2003) with implicational constraints with complex antecedents and enforcing some, but not all, of the inferences possible through appropriateness. In support of efficient processing, implicational constraints are applied only when the antecedent subsumes the description being processed (Penn, 2004), in contrast to ConTroll, where the interpretation of negation is classical, potentially enforcing costly exploration of many disjuncts (unless a delay statement is specified to obtain the interpretation adopted by TRALE).

Strands of Research

HPSG-based processing is an active field of research; thus, in the remainder of this section we point out some of the strands of research.

In line with the current emphasis on human language technology and applied research, a major strand of work on HPSG-based processing is advancing the efficiency, robustness, and applicability of deep processing. This focus includes work on abstract machine compilation (cf., e.g., Wintner, 1997; Miyao *et al.*, 2000), an efficient reimplementation of a lean, phrase structure-based system in C++ (Callmeier, 2000), grammar compilation techniques (cf., e.g., Minnen *et al.*, 1995; Minnen, 2001; Meurers and Minnen, 1997), and a wide range of algorithmic improvements and techniques (cf., e.g., Kiefer *et al.*, 1999; Oepen *et al.*, 2000; Munteanu and Penn, 2004).

A related line of work relieves the HPSG-based deep processing of some of the processing burden by combining it with shallow processing techniques (cf., e.g., Frank *et al.*, 2003) or filtering with extracted context-free grammars (cf., e.g., Kiefer and Krieger, 2000; Torisawa *et al.*, 2000). Some of this work is organized around the Deep Thought project (http://www.project-deepthought.net/), which investigates such hybrid methods for the purpose of information extraction. Stochastic extensions of HPSG have been developed (Brew, 1995; Abney, 1997) and a combination of statistical and linguistic insights is, e.g., explored in the Delph-IN collaboration.

Another strand of research emphasizes and explores the relation of linguistic theory and grammar implementation (cf., e.g. Hinrichs *et al.*, 2004). Work in this strand includes research exploring the expressive means needed for transparent and modular grammar design (cf., e.g., Meurers *et al.*, 2003; Penn and Hoetmer, 2003; Penn, 2004), the development of a core architecture for multilingual grammar development (Bender *et al.*, 2002), and research developing processing regimes for linearization-based HPSG (cf., e.g., Kasper *et al.*, 1998; Daniels and Meurers, 2004; Penn and Haji-Abdolhosseini, 2003) – a paradigm providing modular and compact analyses for languages with relatively free word order (Müller, 2004). In the context of the MiLCA consortium (http://milca.sfs.nphil.uni-tuebingen.de/A4/), the relation between HSPG as a linguistic formalism, its formal foundations, and computational realization is explored from a pedagogical perspective (Richter, 2004b). This relation is also the topic of the CoGETI network.

A further strand of research concerns the integration of grammar implementation and computational semantics, as, e.g., reflected in the papers from the workshop on Semantics in Grammar Engineering included in HPSG (2004) and the HPSG Ellip project.

Finally, though we have focused on language processing from the perspective of computational linguistics, we should mention in closing that the HPSG paradigm has also been used for psycholinguistic research on human sentence processing. HPSG-based models of human language comprehension are, for example, explored in Semantics-Oriented Unification-based Language Processing (Konieczny, 1996), which integrates constraints from linguistic, conceptual, and discourse knowedge.

Head/Dependent Marking

J Nichols, University of California, Berkeley, CA, USA

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Every phrase has a head and one or more nonheads, and the morphology and syntax of the language make it possible to identify the syntactic relations within the phrase. Inflectional morphology, such as cases of nouns, possessive inflection of nouns, agreement of adjectives, and agreement of verbs, identifies the syntactic relations, and depending on the language and the phrase type, that marking may be on the head, on the nonhead, on both, or on neither. Head/dependent marking typology (Nichols, 1986, 1992), also known as the 'locus of marking' (Nichols and Bickel, 2005a, b, c), analyzes morphosyntactic marking in these terms. Languages tend to have predominantly one or another kind of marking in various phrases.

Essential points of head/dependent marking were worked out by Tesnière (1966) and especially Milewski (1967). Milewski's terminology is 'concentric' (head marking) vs. 'excentric' (dependent marking). After preliminary experimentation with Milewski's terms and with 'centripetal' vs. 'centrifugal,' Nichols (1986) proposed 'head marking,' 'dependent marking,' 'double marking,' 'free or floating marking,' and 'no marking' for the individual patterns and 'head-marking language,' 'dependent-marking language,' etc., for whole-language types. The term 'dependent' is taken from dependency grammar, but head/dependent marking typology is neutral as to dependency vs. phrase-structure grammar and is applicable in any syntactic analysis that recognizes heads.

Examples and Language Types

The following examples illustrate the marking types and also illustrate whole-language consistency in the marking types of different phrases. Head-marking patterns from Eastern Tzutujil (Tzutujil) (Mayan, Guatemala; Dayley, 1985) are illustrated by the following.

Head-marked NP (with possessive noun nonhead): marking on the possessed noun, no marking on the possessor:

(1) r-cheeuaal ja kinaq'
3s-stick the bean
'beanpole' (lit. 'the bean's stick') (148)

Head-marked PP: marking on the adposition; no marking on its object. Head-marked adpositions tend to be nominal in origin their inflection is identical to possessive inflection of nouns. They differ from other nouns only in being lexically specialized for relational use. They are generally called 'relational nouns' in the literature. For the purposes of crosslinguistic comparison, however, they may be regarded as an etymologically distinct type of adposition.

(2) ruu-majk jar aachi
3s-because.of the man
'because of the man' (153)

Head-marked clause: marking (agreement) on the verb; no marking on the nouns. Polysynthesis (not illustrated here), though defined variously, always involves strong clausal head marking.

(3) Nuuyoon x-Ø-in-b'an ja jaay
I-along TENSE-*3s-1s-made the house*
'I alone built the house' (155)

(4) X-in-ruu-ti7 jun ajqaaq xe7 weey
TENSE-1s-3s-bite a wasp under my-teeth
'A wasp bit me on the cheek' (305)

Dependent-marking patterns from Eastern Pomo (Pomoan, California; McLendon, 1996) include the following.

Dependent-marked NP: the possessor is in the genitive case and the head has no case:

(5) mí-bax xa-heʔè
*2s-*GEN *water-*SPEC
'your water' (532) (specific is a definiteness category)

(6) wáx péso?
*1s.*GEN *money*
'my money' (533)

Dependent-marked PP: the adposition is uninflected and its object noun takes a case required by the adposition:

(7) xa:lé:-Na di:té:
*tree-*LOC *against*
'(leaning) against the tree' (535)

Dependent-marked clause: subject and object have cases indicating those functions; the verb has no agreement. (AG denotes agent, i.e., ergative case; PAT denotes patient, i.e., accusative case.) Example (8) shows case marking with a transitive verb where the subject is nonhuman and the object is human; different valence categories of verbs and different agent and patient configurations require different cases:

(8) bu:ráqal-là: mí:p-al ša:k'-a
*bear-*AGENT *3s-*PAT *kill-*INDIC
'(A) bear killed him' (534)

Double marking means that both the head and the nonhead have inflectional morphology indicating their relationship. Very few languages are double

marking in all phrase types; one of those few is Central Siberian Yupik (Siberian Yupik) (Eskimoan: de Reuse, 1993; the following examples are in morphophonemic transcription). In a double-marked possessive NP, the possessor is in the relative case and the possessed noun agrees in person and number with the possessor:

(9) aghnagh-m atkuga
woman-REL *parka*-ABS.*3s*
'the woman's parka' (26)

In a double-marked PP, the object is in a case governed by the adposition and the adposition agrees with its object; like most head-marked adpositions, those of double-marking languages are usually relational nouns. In the Yupik relational noun construction, the object takes the relative case and the postposition is a noun in a local case followed by person–number possessive agreement with the object:

(10) manteghagh-m ilu-ngani
house-REL *area.inside*-LOC.*3s*
'inside the house' (29)

In the double-marked clause, subject and objects are case-marked and the verb agrees with both of them. The Yupik verbal agreement suffixes are mostly portmanteau morphs.

(11) qikmigh-ma negh-aa kayu-Ø
dog-REL.*1s* *eat*-IND.*3s–3s* *fish*-ABS
'My dog ate the fish' (30)

No marking is illustrated by Eastern Kayah (Eastern Kayah Li) (Tibeto-Burman: Karen, Thailand and Burma; Solnit, 1996), a prototypical isolating language with almost no inflectional morphology. In such a language, word order and lexical specialization are the only clues to syntactic relations.

Noun phrase:

(12) ne mò
2s *mother*
'your mother' (187)

(13) chā dʌ
chicken *egg*
'chicken egg; chicken's egg' (187)

PP (in Kayah Li, a preposition usually governs not a simple noun but an NP, structurally identical to a possessive NP, whose head noun is a part or location):

(14) dlɣ́ hi lē
at *house* *bottom*
'under the house' (211)

Clause: neither the subject nor the object has any case marking and the verb has no agreement:

(15) ʔa chɯ ʔa thwi
3 *stab* *3* *dog*
'He stabbed his (own) dog' (149)

(16) ʔa bulɛ vɛ́ hʌca
3 *exchange* *1s* *clothes*
'He exchanges clothes with me' (155)

Free or floating marking is illustrated by the following clause from Warlpiri, where the object agreement marker and tense marker are in second, or Wackernagel, position following the first tonic word (Simpson, 1983: 140 cited by Baker, 2001: 1433). These examples have case marking on the subject and object and floating marking of the object:

(17) kurdu-ngku ka-ju nya-nyi ngaju
child-ERG PRES–1SO *see*-NONPAST *1s*.ABS
'The child sees me'

(18) Kurdu-ngku ka-ju ngaju nya-nyi

(19) Nya-nyi ka-ju kurdu-ngku ngaju

(20) Ngaju ka-ju nya-nyi kurdu-ngku

(21) Ngaju ka-ju kurdu-ngku nya-nyi

(22) Nya-nyi ka-ju ngaju kurdu-ngku

The marking is affixal in the above examples, but it can also take the form of phonologically independent words. Subject and object markers in many Polynesian languages, and argument markers in Tagalog and other Philippine languages, are prenominal words that are best considered case words (they are usually called particles or prepositions in the literature), e.g., the object marker in (23) from Maori (Bauer, 1993: 86):

(23) Kei te kai raaua i ngaa kuumara
T/A *eat* *3du* OBJ ART.PL *kumara*
'They are eating the kumaras'

Fijian subject agreement is a separate word preposed to the verb:

(24) era la'o a gone
3p *go* ART *children*
'The children are going'
(Dixon, 1988: 33)

Head/dependent marking typology can be applied to other kinds of phrases as well, such as those with numerals, but there is no consensus on whether, cross-linguistically, the same word is the head in all such phrases. Interclause relations lend themselves to head/dependent analysis if the main clause is taken to be, or contains, the head of the entire complex sentence. Thus, subordination is dependent-marked if the subordinate clause contains a complementizer, nonfinite verb, or other marking of subordination; it is head-marked if the main clause contains a conjunction, particle, or special verb form indicating that it has a subordinate clause; it is double-marked if both clauses have markers; and it has no marking if it is asyndetic. All four possibilities can be illustrated with

English examples, if we assume that in the following the condition clause is subordinate and the consequence clause is main (relevant marking italicized):

(25) *If* it snows we'll cancel the meeting. (Dependent-marked)

(26) It was snowing hard, *so* we canceled the meeting. (Head-marked)

(27) *Whereas* heavy snows are frequent in early February; and
Whereas the availability of transport is unreliable during heavy snows;
Therefore, the Executive Committee resolves that the annual meeting will henceforth be held in April.
(Double-marked; two subordinate clauses to one main clause)

(28) We canceled the meeting, it was snowing. (No marking)

Similarly, relativization can involve a relative pronoun and/or participial or other nonfinite verb form in the relative clause (dependent-marked; the nonfinite morphology is the marking), internally headed relative with a gap or pronoun in the main clause (head-marked; the gap is the marking), correlative construction with markers in both clauses (double-marked), and probably simple juxtaposition of the two clauses (zero-marked). Clause chaining can involve marking of person, tense, etc., only on the main or final clause (head marking), marking of chained clauses with converbs, conjunctions, etc. (dependent marking), marking of both, e.g., nonfinite converb and tensed, person-marking main verb (double marking), or simple juxtaposition without overt marking of either clause (serialization, assuming that sharing of an argument is not taken to create a gap or other marking in either clause). Extending head/dependent marking to interclause relations entails some debatable analyses (as in the examples discussed here), and there is little crosslinguistic consistency between the marking of interclause relations and the head/dependent marking type of phrases and simple clauses; therefore, typological comparison is usually limited to these latter constituents.

Measuring Types

There are various ways in which head/dependent marking can be coded for crosslinguistic surveys. A *dense* survey, as in Nichols (1986, 1992), tabulates the marking type for both possessive NPs, NPs with adjectives, PPs, and clauses with three arguments, for both noun and pronoun arguments. This is time-consuming and inexpedient in that certain contexts prove to favor certain marking types: pronoun arguments, attributive adjectives, inalienable possessors, indirect objects, and subjects all turn out to have universally driven marking patterns that make them unrevealing for typological comparison. Pronouns often have cases when nouns do not, attributive relations are almost never head-marked, inalienable possessors favor head marking, indirect objects are commonly dependent-marked, and subject–verb agreement is strongly favored regardless of language type. PPs are hard to survey as some languages lack them and in many others they are indistinguishable from NPs. Hence, a *sparse* survey of only (alienable) possessor and (direct or primary) object marking is adequate to pinpoint language types (Nichols and Bickel, 2005c). The minimum possible is an *exemplar-based* survey that, identifies the marking of just one relation that adequately reflects whole-language type. Nichols and Bickel (2005b) found that the marking of noun objects of transitives is sufficient for these purposes. Note that, what suffices for plotting or statistical comparison may be less than what one would want in a typology database intended for long-term use and purposes other than identifying head/dependent marking types of languages. For such a database, a survey of possessors in general (alienable and inalienable) and both subject and object, for at least nouns and probably also pronouns, will both identify language types and cover the essentials required for comparison with most literature.

Cysouw (2002) and, implicitly, Baker (1996, 2001) split head/dependent marking into two parameters: head marking and dependent marking (Baker considers clause arguments only; Cysouw considers clauses and phrases). In this approach, a language has head marking if subjects and objects are marked on the verb (whether or not they also bear cases or adpositions, i.e., are double-marked).

Distribution

Languages have some tendency to show the same marking type in different phrases, especially when the universally driven patterns mentioned above are removed from consideration. That is, crossphrasal harmony is a universal tendency, though not a particularly strong tendency. Apart from this, NPs favor dependent marking and clauses favor head marking. There are some statistical affinities of head/dependent marking types for various other typological parameters: head marking and verb-initial order, head marking and split intransitivity, dependent marking and ergativity (Nichols, 1992: 100 ff.).

Head/dependent marking is fairly consistent in language families and thus evidently has good diachronic stability and resistance to diffusion (Nichols, 1992, 1995, 2003). It is a good indicator of large language areas: the head-marking type is common in the Pacific

Rim macroarea and infrequent elsewhere (Nichols, 1992; Cysouw, 2002); head marking in the Baker or Cysouw sense is an ancient Eurasian enclave feature found only in the Himalayas and the Caucasus (Bickel and Nichols, 2003, where the term used is 'polyagreement'). The distribution of head/dependent marking types, macroarea by macroarea, differs so much that no universal profile can be determined (Cysouw, 2002).

Head-Driven Phrase Structure Grammar

R D Levine and W D Meurers, The Ohio State University, Columbus, OH, USA

© 2006 Elsevier Ltd. All rights reserved.

The Linguistic Approach

Our discussion is primarily rooted in Pollard and Sag (1994) as the touchstone of the HPSG paradigm, based on earlier exploratory work (Pollard and Sag, 1987). This choice reflects the high degree of formal explicitness with deep and comprehensive coverage achieved in that work, which brought to fruition a line of research originating in the early 1980s. HPSG was heavily influenced by Generalized Phrase Structure Grammar (GPSG; Gazdar *et al.*, 1985), itself the product of a fertile period at the end of the 1970s and into the early 1980s when a number of explicit and comprehensive alternatives to transformational grammar began to emerge. GPSG, Lexical–Functional

Health and the Media

S McKay, University of Queensland, Brisbane, Australia

Range of Media Sites

Interest in health issues is growing and the mass media play an important role in the dissemination of information and attitudes on health and well-being to the general public through newspapers, magazines, television, radio, and the Internet. The media cover advances in medical treatments and new drugs; they alert their audiences to health risks; they promote the value of taking care of the self; and they act as advocates for change in sociopolitical issues, such as medical funding and health service delivery. The provision of health information is widely distributed across the media, occurring in news stories, documentaries, medical and science programs, and health promotion campaigns. In addition, health and illness are important themes in entertainment media forms such as television dramas, lifestyle shows, and soap operas. Advertisements also feature health promotion, cures, and treatments. Magazines, especially women's magazines, contain significant health content. Health and medical websites on the Internet provide a range of health-related material, and chatrooms and newsgroups facilitate patient to patient interaction and discussion.

Media information and images contribute to the background in which public attitudes to health and well-being are formed, expectations about health care delivery are developed, decisions related to treatment are made, and meanings of illness are understood. Media audiences have become health consumers increasingly encouraged to search out information, to take care of the self, and to expect high standards of medical care and accountability.

Range of Research

Research conducted into health and the media is spread across disciplines including sociology (or specifically, medical sociology), media studies, communication studies (or specifically, health communication), cultural studies, and psychology, and it ranges in methodology from classical quantitative content analysis to qualitative rhetorical or discourse analysis. Much of this work has tended to focus on media coverage of specific conditions such as cancer, HIV–AIDS, and mental illness; and on health issues such as smoking, alcohol use, drug use, diet and nutrition, and body image. Work has also been done on the way medical journalists report 'miracle cures' or 'breakthroughs' based on research sourced from scientific and medical journals. Research has been conducted on media panics and scare campaigns (*see* **Media Panics**). Among special journal issues related to health and the media, attention should be drawn to *Health 3(3),* (1999) (and its editorial by Lupton) and *Sociology of Health and Illness 25(6),* (2003) (and its editorial/overview by Seale).

Risk

A major way in which the media adds to the understanding of health and medical expectations in the lay public is through the coverage of risk. Although the media may see a role for themselves in exposing risks and hazards to the general population or in the failures of public institutions and utilities, the way the media convey risk can be problematic (see Singer and Endreny, 1993). Part of the issue in communicating risk through the media is the difficulty with a form of address that can speak to only a relatively anonymous subject, so that susceptibility and risk factors can be dealt with only in generalized terms rather than in anything approaching individual advice (Greco, 1993). In addition, the current media shift toward tabloidization and sensationalism means that situations of very low or unusual risk are sometimes mistakenly construed as health crises. The media emphasize dangers that, though serious, are relatively uncommon. This selective coverage of hazards and their associated risks using news values that emphasize the unusual, the new, the sudden, or the mysterious mean that stories of this kind receive disproportionate coverage, whereas more common (and often more serious) risks are downplayed or attenuated (such as those associated with smoking or lifestyle) (Kasperson and Kasperson, 1996).

Representations and Health Messages

Other work has looked more generally at health in the media and though some studies note the persistence of uncritical biomedical perspectives and discourses, other research suggests that a more challenging position has emerged. Karpf's (1988) study followed a range of radio and television shows in Great Britain from the 1920s and mapped the ideological debates that led to the rise of the medical consumer. She found toward the end of the time frame that, although the media were becoming more critical in their approach to medicine, they were still following official definitions of health, medicine was still portrayed as the triumphant conqueror of disease, and little was time spent on cultural

determinants of heath or the social origins of illness. Turow (1989) came to similar conclusions. He tracked changes in the doctor-show formula on U.S. television against a changing medical reality where medical resources had become more expensive and where the individual physician was no longer the sole care provider. By the 1970s, some shows occasionally revealed the difficulties of working in under-resourced hospitals, but Turow contended that such hospitals were portrayed as the exception rather than the rule, so that even these shows were not generalizing the problem of scarce resources to the broader medical system. In contrast, Bury and Gabe's (1994) analysis of representations of health and medicine in television programs found that though the medical model of health and illness still held considerable authority, the media used in their study were adopting a more critical and challenging position. Gwyn (2002) looked at representations of health, disease, medicine, and practitioners across a range of mainly British media forms, including television health documentaries and the news media. He noted that, especially in the documentaries, the discourses of medicine remain authoritative and even behavioral and lifestyle issues have become medicalized, with medical explanations and interventions.

There have been few overviews of research published in the area of health and the media. Signorelli's (1993) overview of empirical studies of health coverage reported some of the shortcomings in U.S. television programming such as bias or inaccuracies in health reporting, unhelpful risk communication, stigmatization of the mentally ill, problematic representations of smoking and of alcohol consumption, and unhealthy messages about food, nutrition, and weight. As Seale (2002) pointed out, this work compares media health with health 'reality' and as such it supported the highly critical assessment of the mass media's performance in conveying health messages that is held by health educators. Seale's own survey was more wide-ranging in that it covered a variety of analytical approaches "with a view to highlighting aspects of these that are the most helpful in understanding the rhetorical effects of media health portrayals" (2002: 27). His work led him to conclude that stock story forms and standard characters, oversimplification, stereotyping, and oppositions are key elements in media health representations, as are quantification for rhetorical effect and the use of metaphor to explain complex scientific concepts.

Meanings of Illness

Magazines, especially mass market women's magazines, contain significant health content interspersed with gossip, scandal, features, and advice. Though much of the content is straightforward health information, these magazines publish personal narratives of the illness experiences of celebrities and ordinary people that are often at odds with conventional biomedical accounts of illness, or at least they are telling a different type of story – one that involves their reaction to and their experience of serious illness rather than just its onset, diagnosis, treatment, and prognosis. These narratives, as evaluations of the meaning of illness for the patient's life, are sometimes triumphal accounts of overcoming illness, designed to inspire others in similar situations and sometimes emotional accounts of overwhelming adversity and suffering (McKay and Bonner, 2002). Contextualized within the tabloid discourse of mass market magazines, the main aim of these illness narratives is not to celebrate biomedicine (although medical success is often involved), but to find meaning in illness for sufferers, their families, and the magazine readership.

The Internet offers unprecedented access for its users to detailed medical information, opening up the realm of traditional Western medical authority to the lay public. Internet access may be contributing to a significant increase in health consumerism, and it is also transforming relationship between lay and medical expertise. Dedicated sites and personal home pages provide spaces for users to tell their stories and chatrooms give the opportunity for patient–patient access and interaction in the absence of doctors. These electronic 'virtual' communities provide interactive forums for those with chronic conditions to discuss their fears, their needs, and their activities, augmenting the meanings of illness by providing alternative, or at least parallel, resources to conventional medical interaction. Consumers of health information are becoming producers of health information, at least in the socioeconomic groups able to access the Internet (Hardey, 2002).

Health Promotion

Health promotion campaigns use the mass media to convey their messages of improving public health through rational choice based on taking responsibility for one's health by making changes to one's lifestyle. Taking personal responsibility for health now shapes the dominant perspective in health promotion (Minkler, 2000) and underpins the language of media campaigns. Although using the mass media for health promotion enables issues to be placed on the public agenda and thus raises public consciousness on particular health issues, it is sometimes difficult to attribute specific outcomes, such as attitude or behavior change, to media intervention (Wellings and

Macdowall, 2000). Health promoters can use conventional forms of media to put their message across, but they can also use 'edutainment' strategies (i.e., strategies designed to educate as well as entertain) to deliberately place health issues into episodes of television serials or soap operas (Egger *et al*., 1993). The effectiveness of this strategy is also difficult to evaluate since the health promotion messages are often subtle and secondary to the entertainment values of the program.

Heard Island and McDonald Islands: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

Originally under British control, Heard Island and the McDonald Islands were transferred to Australia in 1947. The islands are now administered from Canberra by the Australian Antarctic Division of the Department of the Environment and Heritage. Situated in the Indian Ocean, these barren, sub-Antarctic islands are populated by large numbers of seal and bird species, but there is no permanent human population. Researchers visit the island for brief periods and are regulated by Australian law. As an Australian territory, English is the official language of the islands.

Hebrew Linguistic Tradition

I Zwiep, Universiteit van Amsterdam, Amsterdam, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Origins

Though the Jewish tradition has always attached great importance to the Hebrew language of Scripture and its interpretation, Hebrew linguistics as a discipline only arose in the early Middle Ages, i.e., after the formative period of rabbinic Judaism. From the 8th century onward, we encounter the first manifestations of linguistic activity in the eastern regions of the Diaspora, which mirror developments in the neighboring Syriac and Arabic cultures. Mostly written in Arabic, the majority of these initiatives centered upon the classical Hebrew of the Bible.

First of all, there was the work of the Masoretes who, with the help of grammatical concepts, recorded all formal aspects of the process of textual transmission and established a definitive text of the Bible. This masoretic text henceforth served as the basis of all exegetical and linguistic study. Indebted to these efforts were the Karaites in Palestine and Byzantium, a fundamentalist current whose renunciation of the Talmud and rabbinic authority led to a renewed scrutiny of the biblical message. Their commentaries and translations strongly depended on grammatical methods, with an emphasis on word structure and semantics (rather than syntax). In Abbasid Iraq, Saadia Gaon (d. 942), head of a talmudic academy, introduced Hebrew equivalents of various Arabic linguistic genres, partly aimed against the Karaites. In the 10th-century Maghreb, we find a number of parallel compositions, particularly on lexicography.

The Medieval Period

It was on the Iberian peninsula, however, that Hebrew grammar was to receive its definitive form. In mid-10th-century Cordoba, the rival schools of Menaḥem ben Saruq and Dunaš ben Labrat produced a series of polemical treatises, in which the biblical idiom was subjected to a morphological-cum-lexical analysis. As Hebrew had been a 'dead' language for centuries, and these were the first linguistic treatises ever written in Hebrew, the authors had to make up their technical vocabulary as they went. They exploited the polemical format in order to refine this new apparatus, which at this stage made no formal distinction between grammar and lexicography (Menaḥem's *Maḥberet*, e.g., was structured as an alphabetically arranged dictionary). The main objective was to reconstruct and semantically identify the underlying base or root of all biblical lexemes. From this abstract root (Ab. *aṣl*) all forms and meanings attested in Scripture could be derived, by adding servile consonants to the radicals, following fixed patterns.

Initially these reconstructions were governed by a structuralist approach, which postulated mono-, bi-, and triliteral roots according to their occurrence in the biblical text. At the turn of the century, however, Judah Ḥayyûj introduced the concept of analogy (Ab. *qiyâs*), which resulted in the reconstruction of triliteral roots for all verbs, including those with so-called weak consonants (which tend to disappear in most derivations). This essential triliterality of the Hebrew root has remained the norm until today. Issues that accompanied the process of discovery and refinement concerned, among others, Hebrew phonology and the permutation of consonants; the autonomy of the biblical corpus and the status of postbiblical Hebrew, language development, and linguistic normativism; and the possibility of comparison with other Semitic languages, particularly Aramaic and Arabic. Unfortunately, a substantial part of this early Andalusian corpus (in particular the linguistic biblical commentaries) is now lost

linguistics. Israeli children should not be indoctrinated to believe that they speak the language of Isaiah – unless the teacher is referring to the 20th-century Israeli polymath and visionary Isaiah Leibowitz. Although revivalists have engaged in a campaign for linguistic purity, the language they created often mirrors the very cultural differences they sought to erase. The study of Israeli offers a unique insight into the dynamics between language and culture in general and in particular into the role of language as a source of collective self-perception.

Biblical Hebrew Lexicography

The Early Period

The beginnings of Hebrew lexicography, more than a thousand years ago, were closely accompanied by the beginnings of Hebrew grammatical description, and both are linked to the name of Rav Saadiah Gaon (Egypt and Babylonia, 882–942). His dictionary *Ha-Egron* (902; Nehemiah Allony edition, 1969), only a fifth of which has survived, was rather short, and many of its entries were translated into Arabic. While not intended, therefore, to be a bilingual dictionary in the modern sense, this is actually what it was, at least to some extent. A supplement was appended in which the words were sorted by their last letter, as was commonly done in dictionaries of Arabic (for rhyming purposes). Another Hebrew-Arabic dictionary from the 10th century is *Kitab Jame' al-Alfaz* by the Karaite David ben-Abraham el-Fassi, written in Jerusalem between 930 and 950 in two versions, a long one and a short one (the latter was published by Skoss in 1936).

The first Hebrew–Hebrew dictionary was written somewhat later by Menahem ben-Saruq (Spain, mid-10th century), and it provoked a flurry of debates, initiated by the criticisms of his contemporary Dunash ben-Labrat, both on some fine points of grammar and on some explanations of biblical terms. Among other things Dunash asserted, for example, that the root of YGWN *yagon* 'distress' is GN while Menahem claimed it to be the one-letter root G (see Table 1 for the method of transcription used in this article). These criticisms were answered by Menahem's pupils, and the dispute was finally decided by R. Yaacov ben-Meir (known as Rabbenu Tam, France, 12th century). Both these

Table 1 The Hebrew alphabet

א	aleph	`	ו	waw	W	כ	kaf	K	ע	ayin	ʿ	ש	shin	š
ב	bet	B	ז	zayin	Z	ל	lamed	L	פ	pe	P	ת	tav	T
ג	gimal	G	ח	het	Ḥ	מ	mem	M	צ	tsadi	Ṣ			
ד	dalet	D	ט	tet	Ṭ	נ	nun	N	ק	qof	Q			
ה	he	H	י	yod	Y	ס	samekh	S	ר	resh	R			

In order to give the reader as faithful a picture as possible of the Hebrew words cited, they are represented in up to three forms: a letter-per-letter transliteration (when needed) in small capitals, as per this table; the pronunciation in italics; and an English translation.

dictionaries are arranged alphabetically by roots, i.e., the set of letters that remain fixed throughout all the derivations of a word. According to this view, while most roots were indeed of three letters, there were some roots of two letters and even some of just one letter, such as Z for the verb HZH *hizza* 'sprinkled,' since this is the only remaining letter in the conjugated form YZW *yazzu* 'they will sprinkle.' (In ben-Saruq's lexicon there were 14 such roots.)

Probably the finest achievement of medieval Hebrew lexicography is *Kitab al-ʼuṣul* 'The book of roots' by Yonah ibn-Janaḥ (Spain, 11th century). This dictionary, the second part of his *Kitab al-tankiḥ* 'The grammar book,' in which he describes the grammar of Biblical Hebrew, was the first lexicon to adopt the three-letter root concept devised by ibn-Janah's master, Yehudah Ḥayyuj. It was written in Arabic (as was common for many of the writings of Jewish authors at this period in the region), and was translated into Hebrew in the 12th century by Yehudah ibn-Tibon (Bacher edition, Berlin, 1894–1897). An abbreviated version was prepared by Shlomo Parḥon (Italy, 12th century) in his *Maḥberet he-arukh*. Another Hebrew dictionary in Arabic *Kitab*, *al-Istighnaʼ*, was compiled by Shmuel ha-Nagid (Spain, 11th century), but only a few fragments of what was apparently a comprehensive work have survived.

By far the most important Hebrew dictionary of the Middle Ages is *Sefer ha-shorashim* 'The book of roots' by R. David Qimḥi (usually abbreviated as RaDaQ; Provence, 13th century), which was in a sense the culmination of all the lexicographic works that preceded it. This dictionary (part of a larger work that included a treatise on Biblical Hebrew grammar), based mainly on the work of Ibn-Janaḥ, was translated into Latin, and had a decisive influence on the Christian scholars who later worked in the field of Biblical lexicography.

From the Renaissance until Modern Times

From the early Renaissance period onward, there was a steady decline in Biblical Hebrew lexicographical work by Jewish scholars: the bulk of the important achievements in this type of lexicography was achieved by Christian scholars, who were much influenced, as mentioned above, by the works of R. David Qimḥi. A representative lexicon of this category is the *Lexicon hebraecum et chaldaicum* by Johannes Buxtorf (Basel, 1607). Most prominent in this genre were the works of William Gesenius in the 19th century, in which the scientific discoveries of comparative Semitic linguistics and of Near East studies were integrated. His practical *Handwörterbuch* (Leipzig, 1810–1812) was very popular and went through at least five editions. His masterpiece, *Thesaurus philologicus criticus linguae hebraeae et chaldaeae veteris Testamenti*, published partly posthumously (Leipzig, 1829–1858), went through several new editions and adapted versions, notably a German edition by F. Buhl (Leipzig, 1895–1915) and an English one by F. Brown, S. F. Driver, and C. A. Briggs (Oxford, 1907), which was also reprinted many times. Finally, mention should be made of the important dictionary by L. Köhler and W. Baumgartner, compiled on scientific philological principles, the most recent edition of which, in English by M. E. L. Richardson, was published in 1996.

Lexicography of Talmudic Literature

All of the dictionaries mentioned so far concern themselves mainly with Biblical Hebrew, generally considered in the Middle Ages to be the only kind of Hebrew deserving of study and attention. Even then, however, there were attempts to deal also with Talmudic literature and even with the core of Hebrew literature available at the time. The first noteworthy work of this kind is *Kitab el-ḥawi* 'The comprehensive book,' by Rav Hai Gaon (Babylonia, 11th century), the last of the *gaonim* (the masters of the official Yeshiva, the Rabbinical Academy, in Babylonia), and of which, again, only fragments remain today. A very important work is *he-ʻArukh*, by R. Nathan ben-Yeḥi'el of Rome (11th century), which is a lexicon of Talmudic literature, including those parts of it that are in Aramaic. This work received many additions and supplements (of which *Tishbi*, by Eliyyahu Baḥur [Elijah Levita], Italy, 1541, should be mentioned), culminating in the scholarly *ʻArukh ha-Shalem* (Aruch Completum) by Ḥanoch Yehudah (Alexander) Kohut (Vienna, 1878–1892).

To complete the account of this genre, we mention two dictionaries that were published in the 19th century: *Neu-hebräisches und chaldäisches Wörterbuch über die Talmudim und Midraschim* by Jacob Levy (4 vols, Leipzig, 1876) and *A dictionary of the Targumim, the Talmud Babli and Yerushalmi, and the Midrashic literature* by M. Jastrow (2 vols, New York, 1903). The latter was reprinted several times and is still widely used today.

Hebrew Lexicography in Modern Times

The 19th Century

The 19th century witnessed a revival of Hebrew lexicography, motivated principally by the *Haskala* 'Enlightenment' movement among European Jewry.

A dictionary typical of this period is *Otzar ha-shoraṣhim* 'The compendium of roots' by Yehudah Leib ben-Zeev (Vienna, 1807). It is arranged by root, with an appendix that clarifies the root of certain difficult constructs. The explanations contain a translation into German, and the third part is in fact a German–Hebrew dictionary that can be also seen as a Hebrew thesaurus. The *Otzar* was reedited by several scholars, the fifth edition (prepared by Moshe Schulbaum, Lvov, 1889–1891) being in fact a new dictionary of Hebrew. Another important dictionary of the period is *ha-Otzar* by Shmuel Yosef Fünn (Warsaw, 1884–1904), which covers the Hebrew lexicon of the Bible, Talmudic literature, and later Hebrew writings, including the *Piyut* 'poetry' literature. It also gives translations into Russian and German. The Biblical Hebrew dictionary *Mishpat ha-'Urim* by Yehoshua Steinberg (1897), which likewise gives translations into Russian and German, should also be mentioned.

The 20th Century

The revival of Hebrew as a spoken language in daily life in the 20th century radically changed the face and range of activities of Hebrew lexicography, whose basic locus was now in Israel (Eretz Israel or Palestine until 1948). This is where most of the dictionaries mentioned in this section were published.

The first and most important step in this revival can be attributed to the great dictionary of Eliezer ben-Yehudah, *Millon ha-lashon ha-ivrit ha-yeshana veha-ḥadasha* 'Dictionary of the old and new Hebrew language.' This is a comprehensive lexicon of the Hebrew language in its widest spectrum, from Biblical times to the present day, including new words that were coined daily (including some coined by the author himself) to cope with the necessities of using this 'old new' language for all kinds of communication in a modern and complex environment. This work, particularly rich in citations from all strata of writing in Hebrew, was the first Hebrew–Hebrew dictionary in which the entries were arranged as lemmas (except for verbs, which were still arranged by root). It was also the first in which the emphasis was on a diachronic description of the meanings of words, their evolution through the ages, and their etymology. The first volume was published in 1908, and the entire dictionary, in 17 volumes (including one with a 'Comprehensive introduction'), was finally completed in 1959, long after the original author's death. Volumes 8 and 9 were edited by Moshe Zvi Segal, and volumes 10–16 by Naftali Herz Torczyner (Tur-Sinai). Both faithfully followed ben-Yehudah's original lexicographic plan and editorial policies. This work is the only truly comprehensive and authoritative historical dictionary of Hebrew on historical principles.

In 1938, the *Millon ivri* 'Hebrew dictionary' of Yehudah Goor (Garsovski) was published. Its second edition (1946) was, in its day, probably the most popular dictionary of Hebrew. A new era of Hebrew dictionaries opened with the publication of *Millon ḥadash* 'A new dictionary,' by Avraham Even-Shoshan, whose first edition (5 vols, 1948–1952) and in particular the second edition, *ha-Millon he-ḥadash* 'The new dictionary' (1966), dominated the dictionary scene in Israel for the second half of the 20th century. Besides covering the totality of the Hebrew lexicon, including recently coined words, this dictionary was the first to include the wealth of loanwords from foreign languages that were rapidly infiltrating everyday speech in Israel, not to mention a wealth of short encyclopedic entries from various domains such as botany, zoology, and chemistry. The dictionary text (entries, definitions, citations, and examples) was fully vocalized, which made it easily accessible to the multitude of citizens of Israel, many of them newly arrived in the country and still struggling with their Hebrew. This dictionary, whose name has become almost synonymous with the concept of 'Hebrew dictionary,' was reprinted very many times, but in the 40 years since its appearance in its second edition, no effort has been made to update it to reflect the rapidly changing world of the Hebrew language on one hand, and modern lexicographical principles, including those inspired by the emerging computerized lexicography, on the other. The latest version (edited by Moshe Azar, 2003) has been updated mainly with new entries, but the basic architecture and structure are not affected in any way.

Another large dictionary from the second half of the 20th century is the *Thesaurus of the Hebrew language* by Yaacov Kena'ani (18 volumes, 1960–1989), whose aim was to fully record every word ever used in a Hebrew text, including even the rarest ones, such as one-time words coined by poets. There were of course other dictionaries published with less ambitious scope during this period, including:

- *Me-aleph 'ad tav* 'From A to Z' by Meir Medan (1954, 1973)
- 'The Hebrew-Hebrew dictionary' by Reuven Alkalai (3 vols, 1969–1971)
- *Millon ha-hove* 'Dictionary of the present day', by Shoshana Bahat and Mordechay Mishor (1995), whose basic novelty was that the entries for verbs were in the present (participle) tense, rather than in the past tense as was traditionally done in other dictionaries. It also strictly adheres to what is

sanctioned by the Academy of Hebrew Language, so it serves as a guide to what is regarded as being formally correct in Hebrew linguistics
- *Millon sappir* by Eytan Avneyon (7 vols, 1998), published earlier in one volume as *The Concise Sapphire dictionary* (1997).

A dictionary that is radically different in its lexicographic principles, as well as in its design and structure, from all of the above is *Rav-Milim: the complete dictionary of Modern Hebrew* by Yaacov Choueka and the Rav-Milim team (6 vols, 1997). As a user-oriented work, *Rav-Milim* is synchronic rather than historical, descriptive rather than normative (although bad usage is clearly tagged as such), and comprehensive. It covers all registers of the language, from literary to slang, and from the refined to the vulgar, and all its strata, from the Biblical to the modern. It does not, however, aim to be exhaustive – for example, it omits historical curiosities, obsolete coinages used only once, and the like. All entries are arranged by lemma, including verbs, whose entries are in the past form (in the specific mode). The entire dictionary – including the entries – is written in *ktiv male* ('*plene*') spelling, with partial vocalization. Following the new sensitivity to meaning in context, acquired recently through extensive computerized processing of large corpora, the rich spectrum of the different meanings of an entry is deployed, and usage examples, carefully selected to highlight the appropriate sociolinguistic context, are given for every non-encyclopedic entry. For each entry, the word's 'family' (words with the same root and the same semantic field) is detailed. Special attention is given to collocations – compound nouns, verbal attachments, fixed phrases, idioms, etc. – and thousands of collocations, never recorded before, are explained. Also, it is the only Hebrew dictionary that has a computerized version, supporting a number of sophisticated search and analysis functions, available on the Internet.

Special Topics

The Academy of the Hebrew Language

Many projects and activities related to linguistic and lexicographic issues are being undertaken at the Academy of the Hebrew Language in Jerusalem. Relevant to this article is the Historical Dictionary Project, already under development for more than 40 years, whose aim is to compile a complete historical dictionary of the Hebrew language throughout its many generations. The project is still basically at the stage of compiling the required corpus. An illustrative brochure was produced in 1982 that gives a complete treatment of just one root, ʿRB. A CD was published by the academy in 2001, containing an authoritative collection of all Hebrew writings from the 2nd century B.C.E. to the middle of the 11th century C.E., based on the best manuscripts available. This forms part of the corpus on which the Historical Dictionary will eventually be based.

Another relevant activity of the academy is the coining of new Hebrew words in various domains such as medicine, law, accounting, psychology, optics, banking, sports, and many more. More than 100 000 words have been coined and officially recorded thus far by the academy. They can be accessed on line at the academy's website.

Dictionaries of Slang

Until the publication of *Rav-Milim*, slang and vernacular words were seldom included in regular Hebrew dictionaries. The first dictionary of slang was that by Raphael Sappan (1965, 1971), which was followed by the dictionary by Dan ben-Amotz and Netiva ben-Yehudah (2 vols, 1972–1982). A dictionary of military slang was compiled by Oded Ahiasaf (1993).

Bilingual Dictionaries

Many of the Hebrew dictionaries mentioned above, including some of the earliest ones, can be considered *de facto* as bilingual, since they contained translations of the entries in Arabic, German, or Russian. In the stricter sense of the word, however, we may mention first a few works that are of historical interest: *Tzemaḥ David* (Venice, 1587), a trilingual Hebrew–Latin–Italian dictionary by David de Pomis, dedicated to Pope Sixtus V; *Galut Yehudah* (Venice, 1612), a Hebrew–Italian dictionary by Leon da Modena; a Hebrew–Portuguese dictionary (Amsterdam, late 1600s) by Oliveyra Solomon; and *Meir Nativ*, a trilingual Hebrew–Russian–German dictionary by Yehudah Leib Germayza (Vilnius, 1835). Much closer to our times is the *English–Hebrew dictionary* by Israel Efros, Judah ibn-Shmuel Kaufman, and Benjamin Silk (1929), intended for learners of Hebrew as a second language. For every English entry, this work lists a large number of Hebrew equivalents; thus it can be viewed also as a lexicon of synonyms in Hebrew.

The second half of the 20th century saw the publication of a huge variety of bilingual dictionaries in a multitude of languages, due to the sociological context of Israel as a 'melting pot' of so many different linguistic communities. It would be a hopeless task to try to review this activity comprehensively, so let us just mention the Hebrew–English dictionary of Reuben Alcalay (1964–65; second enlarged edition, 1996), the *Megido* Hebrew–English and English-Hebrew dictionaries of Edward Levenstone and

Reuben Sivan (1965), and the Hebrew–German dictionary of Jaacov Lavy (1975). Special mention should be made of the dictionaries published by Hayim Baltsan for Hebrew–Russian and Hebrew–English, intended for Hebrew learners who hear Hebrew words but have difficulties in conceiving their spelling, so the entries are Russian/English phonetic equivalents of the Hebrew words, and the dictionary is sorted alphabetically by the transcribed entries.

Computerized Resources

Quite a number of computerized resources are now available for Hebrew. Regarding corpora, the following should be mentioned:

- *Maba'*, the Bar Ilan University Corpus of Modern Hebrew, which contains 199 books (novels and short stories), a full one-year set of issues of a local weekly magazine, news items from the Internet, collected articles from a daily newspaper, and the full minutes of six months' sittings of the Knesset, totaling in all 25 million words of modern Hebrew;
- the corpus of the Academy of the Hebrew language of early Hebrew writings (mentioned above);
- The Responsa Corpus of Bar Ilan University, available also on CDs to the general public, which contains many hundreds of books of rabbinical literature in Hebrew and Aramaic, encompassing almost 2000 years of writings and originating from all over the world.

Similar CD corpora of (different) rabbinical books have also been circulated in recent years in Israel, too numerous to mention here. In terms of software, two operational programs, both developed by Yaacov Choueka and the Rav-Milim team, can be mentioned: *Milim*, a program for the complete and accurate lemmatization and morphological analysis of any word in Modern Hebrew, and *Nakdan*, a program for the automatic vocalization of Hebrew texts with an accuracy of 98%.

Finally, a government-supported Knowledge Center for Processing Hebrew has recently been established at the Technion in Haifa, whose mission is to research and produce tools necessary for the intelligent processing of Modern Hebrew, including the building of appropriate tagged corpora and the dissemination of reliable operational software for such processing.

In the past 30 years, the abundance of literature that has been dedicated to Heidegger throughout the world gives us a clear measure of the significance of his contribution to philosophy. Heidegger's works have been translated into every major language, regardless of the intriguing linguistic peculiarities that distinguish them.

In 1924, Heidegger summarized Aristotle's biography as follows: "He was born, he worked, and he died." The same concept could be applied to Heidegger himself. In fact, for him life and work coincided in a way that was almost unparalleled among the authors of the 1900s. After examining the early stages of his own philosophical development, which culminated

Heard Island and McDonald Islands: Language Situation

Editorial Team

© 2006 Elsevier Ltd. All rights reserved.

Originally under British control, Heard Island and the McDonald Islands were transferred to Australia in 1947. The islands are now administered from Canberra by the Australian Antarctic Division of the Department of the Environment and Heritage. Situated in the Indian Ocean, these barren, sub-Antarctic islands are populated by large numbers of seal and bird species, but there is no permanent human population. Researchers visit the island for brief periods and are regulated by Australian law. As an Australian territory, English is the official language of the islands.

Hebrew Linguistic Tradition

I Zwiep, Universiteit van Amsterdam, Amsterdam, The Netherlands

Origins

Though the Jewish tradition has always attached great importance to the Hebrew language of Scripture and its interpretation, Hebrew linguistics as a discipline only arose in the early Middle Ages, i.e., after the formative period of rabbinic Judaism. From the 8th century onward, we encounter the first manifestations of linguistic activity in the eastern regions of the Diaspora, which mirror developments in the neighboring Syriac and Arabic cultures. Mostly written in Arabic, the majority of these initiatives centered upon the classical Hebrew of the Bible.

First of all, there was the work of the Masoretes who, with the help of grammatical concepts, recorded all formal aspects of the process of textual transmission and established a definitive text of the Bible. This masoretic text henceforth served as the basis of all exegetical and linguistic study. Indebted to these efforts were the Karaites in Palestine and Byzantium, a fundamentalist current whose renunciation of the Talmud and rabbinic authority led to a renewed scrutiny of the biblical message. Their commentaries and translations strongly depended on grammatical methods, with an emphasis on word structure and semantics (rather than syntax). In Abbasid Iraq, Saadia Gaon (d. 942), head of a talmudic academy, introduced Hebrew equivalents of various Arabic linguistic genres, partly aimed against the Karaites. In the 10th-century Maghreb, we find a number of parallel compositions, particularly on lexicography.

The Medieval Period

It was on the Iberian peninsula, however, that Hebrew grammar was to receive its definitive form. In mid-10th-century Cordoba, the rival schools of Menaḥem ben Saruq and Dunaš ben Labrat produced a series of polemical treatises, in which the biblical idiom was subjected to a morphological-cum-lexical analysis. As Hebrew had been a 'dead' language for centuries, and these were the first linguistic treatises ever written in Hebrew, the authors had to make up their technical vocabulary as they went. They exploited the polemical format in order to refine this new apparatus, which at this stage made no formal distinction between grammar and lexicography (Menaḥem's *Maḥberet*, e.g., was structured as an alphabetically arranged dictionary). The main objective was to reconstruct and semantically identify the underlying base or root of all biblical lexemes. From this abstract root (Ab. *aṣl*) all forms and meanings attested in Scripture could be derived, by adding servile consonants to the radicals, following fixed patterns.

Initially these reconstructions were governed by a structuralist approach, which postulated mono-, bi-, and triliteral roots according to their occurrence in the biblical text. At the turn of the century, however, Judah Ḥayyûj introduced the concept of analogy (Ab. *qiyâs*), which resulted in the reconstruction of triliteral roots for all verbs, including those with so-called weak consonants (which tend to disappear in most derivations). This essential triliterality of the Hebrew root has remained the norm until today. Issues that accompanied the process of discovery and refinement concerned, among others, Hebrew phonology and the permutation of consonants; the autonomy of the biblical corpus and the status of postbiblical Hebrew, language development, and linguistic normativism; and the possibility of comparison with other Semitic languages, particularly Aramaic and Arabic. Unfortunately, a substantial part of this early Andalusian corpus (in particular the linguistic biblical commentaries) is now lost

and known to us only in fragments or through quotations.

In 11th-century Spain, Ḥayyûj's triliteral doctrine was perfected, with the help of Arabic models, by Abulwalid Marwân (Yonah) ibn Janâḥ, in a polemical correspondence with statesman and man of letters Samuel ha-Nagid (d. 1056). The results were summarized in Ibn Janâḥ's bi-partite *Kitâb at-Tanqîḥ* (The Book of Detailed Investigation), which, for the first time, consisted of a separate grammar and dictionary. Before long, the joint oeuvre of Ḥayyûj and Ibn Janâḥ, originally written in Arabic, achieved canonical status, in al-Andalus and beyond.

In 12th-century Italy and Provence, their works were translated into Hebrew by the traveling scholar Abraham ibn Ezra (d. 1164/7) and other Jewish emigrants from the Iberian peninsula. Towards the end of the century, the Qimḥi family in Narbonne took care of further dissemination through a series of abridged, didactic manuals in Hebrew. David Qimḥi's – again bi-partite – *Sefer ha-Mikhlol*, a systematic adaptation plus critique of Ibn Janâḥ's *Tanqîḥ*, became the central work of this new branch of linguistics.

For the next four centuries, this classical Andalusian-Provençal canon, with its characteristic blend of complementary phonology, morphology and lexicography, dominated Hebrew linguistics from England to North Africa and the Middle East. Numerous Hebrew adaptations were written. Occasionally, we come across local trends and predilections, individual forays into the adjacent fields of logic or poetics, and, in the 15th century, the incorporation of elements from Latin (scholastic) thinking.

Throughout the entire period, the grammars of Hebrew remained predominantly descriptive. For speculation on theoretical issues, such as the origin and nature of language and its relation to human thought and reality, we have to turn to the introductory chapters of linguistic works, to biblical commentaries and individual passages in works on logic and philosophy. One might say, however, that the most authentically Jewish philosophy of language lies embedded in the ontological and talismanic linguistic speculations of the Kabbalah. Like mainstream Jewish linguistic thinking, these mystical-magical doctrines were ultimately based on Aristotelian conceptions of language.

16th and 17th Centuries

Before the 16th century, the study of Hebrew grammar had been an almost exclusively Jewish pursuit. Even if medieval Christian scholars occasionally displayed an interest in Hebrew sources, they never studied the Hebrew language itself. With the exception of a few rudimentary excerpts, they produced no Hebrew textbooks. By contrast, the first half of the 16th century witnessed an outburst of Christian Hebrew erudition, fostered by two intellectual currents: (1) Renaissance Humanism and its ideal of *eruditio trilinguis*, i.e., the knowledge of Latin, Greek, and Hebrew; and (2) the Reformation, which, preferring the authority of the Bible to that of the Church, called for a new interpretation of Scripture and, with it, for the study of Hebrew.

The first generation of Christian Hebraists turned to the work of Jewish predecessors, especially the grammars of Moses and David Qimḥi, and to Jewish teachers. The most famous of these was Eliah Levita (d. 1549), author of several introductory works on Hebrew and Aramaic and teacher of, among others, Sebastian Münster (d. 1552). The Hebrew grammars written by Münster and his contemporaries remained rather elementary. They continued traditional Jewish elements (such as the tripartition of the language into noun, verb, and particle, and the word-based approach to syntax), while simultaneously introducing terminology, classifications, and definitions from the Latin tradition. At this stage, this procedure entailed no significant changes in grammatical content and methodology.

Throughout the 16th and 17th centuries, Christian Hebraism flourished in Western Europe. In the universities, prestigious chairs were founded. In the faculties of theology, Hebrew was taught as an introduction to the theological exegesis of the Old Testament or to Jewish antiquities, and occasionally for missionary purposes. Christian Hebrew grammars became increasingly sophisticated, often reflecting current developments in the Latin tradition or even recent critical approaches in Hebrew studies. In the Republic of Letters, countless popular grammars of Hebrew were published for a growing audience, and great energy was devoted to perfecting didactic strategies. For many years, the work of the Swiss Buxtorf family (father and son, d. 1629 and 1664, respectively) remained of seminal importance.

In contrast, Jewish interest in linguistic studies dwindled. In Germany and Central Europe, only a handful of rudimentary school manuals was published. In Amsterdam, several Portuguese-Jewish rabbis composed Hebrew textbooks, again to be used in the classroom, which foreshadow later, enlightened, developments. Written in Portuguese, these grammars were organized like grammars of Latin and combined elements from the Western tradition (e.g., the use of cases) with traditional Jewish classifications. Spinoza's *Compendium grammatices linguae hebraeae* (1677) forms the (rather idiosyncratic) climax of this small corpus.

The 18th Century

In the 18th century, Hebrew lost its prime position, when scholars such as Albert Schultens and his rational empiricist Dutch School began to emphasize the *utilitas* of other oriental dialects for reconstructing the *origines* of Hebrew. No longer regarded as the mother of all languages, the holy tongue became Arabic's inferior sister language. With (synchronic) language comparison taking center stage, the Christian Hebraist was replaced by the *professor linguarum orientalium*. In 1781, A. L. Schloezer finally introduced the genetic designation Semitic languages.

Simultaneously, a renaissance of Jewish Hebrew studies took place in Germany. At the beginning of the 18th century, the medieval heritage was reclaimed and updated by the controversial but influential Solomon Hanau. Toward the end, *maskilic* (enlightened) Jewish grammarians combined this indigenous model with criteria from the Latin school tradition and contemporary German *Sprachwissenschaft*. In doing so, they laid the foundation for the massive corpus of Hebrew school manuals written (in the various European vernaculars) during the 19th century.

19th and 20th Centuries

In 19th-century academic Hebrew studies, the impact of the historical-comparative analysis of the Indo-European languages was growing. This trend was strengthened by the discovery of Akkadian and other (cognate) languages. The systematic application of diachronic methods enabled scholars to reconstruct proto-Semitic forms, which for the first time added a dimension to biblical Hebrew that went beyond the authoritative masoretic text. In addition, there arose an interest in other Jewish languages besides biblical Hebrew, notably in Mishnaic Hebrew and Aramaic, due to the growing awareness of the Jewish context of the New Testament.

One outcome of the process of modern Jewish emancipation was the revival of Hebrew as a living language. First in Eastern Europe, where it was propagated as the language of Jewish literature and journalism, then in Palestine, where it became a spoken language. In three successive waves of immigration (from the 1880s onward), a comprehensive, secularized, Hebrew public sphere was established, which was soon institutionalized. From 1890 onward, the process was monitored by the Hebrew Language Committee (which was replaced by the Academy of the Hebrew Language in 1953). The chief ideologue of the revival, the Lithuanian-born Eliezer Ben-Yehuda (d. 1922), became a national icon of mythological proportions.

As the language of the State of Israel, Israeli Hebrew soon became both object and medium of intensive linguistic study. Today a plethora of linguistic methods, synchronic as well as diachronic, are applied to all phases of Hebrew and Aramaic by scholars in, especially, Israel, Europe, and the United States.

Hebrew is the language of the people who, from the 11th century B.C., were dominant politically and culturally in and around what is the State of Israel. Members of this people stopped living in most of its ancient lands in any significant numbers following the Roman suppression of the Bar-Kochba revolt in 135 A.D. Indeed, for some 500 years previously Jews (from Judah/Judea, in the south of Israel) had settled in large numbers throughout the Hellenistic and Persian world. Even though they retained a high level of ethnic exclusivity, Jews became identified, and tended to identify themselves, as being more a 'religious' than a 'national' group, and this has been of enormous significance for the survival of Hebrew over three millennia.

A Holy Language

From the early centuries A.D., Hebrew is frequently referred to as '*lēshōn ha-qōdesh*' 'the sacred language' in contrast to other languages spoken by Jews – particularly Greek, Aramaic, and, much later, Yiddish. In addition, the Hebrew of the Bible was sometimes regarded (by certain medieval writers, for example) as 'purer' than later varieties. It is possible that this view is attested as early as the second century B.C., when the Qumran community derided their religious adversaries as speaking an 'uncircumcized tongue' (Rabbinic Hebrew, perhaps). Jewish traditions claim that Hebrew was the language spoken at the creation, that the letters of the Hebrew alphabet were active in the creation (see *Alphabet: Religious Beliefs*), and that it is the only language understood by the angels and efficacious in prayer.

Biblical Hebrew

The main corpus of ancient Hebrew is the Bible (minus its Aramaic portions), consisting of 304 901 graphic word-tokens. The consonantal text of this corpus had achieved roughly its current state by the 2nd century B.C., after several revisions of its different parts. A point to be stressed is that Biblical Hebrew, as it has been handed down, comprises a literary, rather than an oral or 'colloquial,' corpus. The Bible is not a straightforward record of spoken utterances from biblical times, but is better viewed as a collection of written compositions, including literary versions of conversations, orally transmitted stories, etc.

The language of those parts of the Bible composed after the Jews' return from exile in Babylonia (538 B.C.) is sometimes called 'Late Biblical Hebrew,' and it differs from the 'Classical' literary language of before the exile (586 B.C.). Partly it represents a consciously 'archaizing' imitation of the earlier language and partly, like Rabbinic Hebrew, a distinct, naturally developed, stage in the history of Hebrew.

When the Bible is viewed as a single work, albeit a composite of different works, it is clear that it has been written, or at least edited, from a religious perspective and with religious motives. Even so, it contains relatively little material that was composed in order to express feelings of a specifically religious character. Far more representative are historical or epic narratives, historical fiction, social polemic ('prophecy'), and detailed regulations about law, the cult, and city planning. It has been claimed that Biblical Hebrew is particularly rich in vocabulary related to, for example, farming and water sources. But unlike the Arabic of the Qur'ān created in a state of religious fervor, Biblical Hebrew is restrained in its descriptions of and vocabulary for the divine. In short, the corpus is more concerned with a people whose religion was of major importance to it rather than with that religion itself.

Hebrew is the language of the people who, from the 11th century B.C., were dominant politically and culturally in and around what is the State of Israel. Members of this people stopped living in most of its ancient lands in any significant numbers following the Roman suppression of the Bar-Kochba revolt in 135 A.D. Indeed, for some 500 years previously Jews (from Judah/Judea, in the south of Israel) had settled in large numbers throughout the Hellenistic and Persian world. Even though they retained a high level of ethnic exclusivity, Jews became identified, and tended to identify themselves, as being more a 'religious' than a 'national' group, and this has been of enormous significance for the survival of Hebrew over three millennia.

A Holy Language

From the early centuries A.D., Hebrew is frequently referred to as '*lēshōn ha-qōdesh*' 'the sacred language' in contrast to other languages spoken by Jews – particularly Greek, Aramaic, and, much later, Yiddish. In addition, the Hebrew of the Bible was sometimes regarded (by certain medieval writers, for example) as 'purer' than later varieties. It is possible that this view is attested as early as the second century B.C., when the Qumran community derided their religious adversaries as speaking an 'uncircumcized tongue' (Rabbinic Hebrew, perhaps). Jewish traditions claim that Hebrew was the language spoken at the creation, that the letters of the Hebrew alphabet were active in the creation (see *Alphabet: Religious Beliefs*), and that it is the only language understood by the angels and efficacious in prayer.

Biblical Hebrew

The main corpus of ancient Hebrew is the Bible (minus its Aramaic portions), consisting of 304 901 graphic word-tokens. The consonantal text of this corpus had achieved roughly its current state by the 2nd century B.C., after several revisions of its different parts. A point to be stressed is that Biblical Hebrew, as it has been handed down, comprises a literary, rather than an oral or 'colloquial,' corpus. The Bible is not a straightforward record of spoken utterances from biblical times, but is better viewed as a collection of written compositions, including literary versions of conversations, orally transmitted stories, etc.

The language of those parts of the Bible composed after the Jews' return from exile in Babylonia (538 B.C.) is sometimes called 'Late Biblical Hebrew,' and it differs from the 'Classical' literary language of before the exile (586 B.C.). Partly it represents a consciously 'archaizing' imitation of the earlier language and partly, like Rabbinic Hebrew, a distinct, naturally developed, stage in the history of Hebrew.

When the Bible is viewed as a single work, albeit a composite of different works, it is clear that it has been written, or at least edited, from a religious perspective and with religious motives. Even so, it contains relatively little material that was composed in order to express feelings of a specifically religious character. Far more representative are historical or epic narratives, historical fiction, social polemic ('prophecy'), and detailed regulations about law, the cult, and city planning. It has been claimed that Biblical Hebrew is particularly rich in vocabulary related to, for example, farming and water sources. But unlike the Arabic of the Qur'ān created in a state of religious fervor, Biblical Hebrew is restrained in its descriptions of and vocabulary for the divine. In short, the corpus is more concerned with a people whose religion was of major importance to it rather than with that religion itself.

Hebrew is not the only language used in the great documents of Judaism. The Palestinian and Babylonian versions of the Talmud (5th to 6th centuries A.D.), excluding the Mishnah (ca. 225 A.D.), are both written mostly in Aramaic, as is the Zohar (late 13th century A.D.). Aramaic is also used for parts of the prayer book and even the Bible itself. Arabic (albeit often written in Hebrew characters) was the language of most of the great works of Jewish theology/philosophy written in territories under Muslim domination, especially Spain. Elsewhere in Europe, Yiddish was employed from the 17th century onward for devotional and ethical literature.

Moreover, even in biblical times, the use of Hebrew for secular (and nonliterary) purposes is attested on hundreds of inscriptions on seals, ostraca, stelas, etc. (These provide a further corpus of 'pre-Rabbinic' Hebrew along with various manuscripts of Ecclesiasticus and the majority of the Dead Sea Scrolls.)

The Decline of Hebrew

After the Babylonian exile, a variety of Hebrew known as 'Rabbinic Hebrew' developed. It existed until the 2nd century A.D. as a popular spoken dialect (Tannaitic Hebrew), represented in literary form by the Mishnah. Thereafter, it survived another eight centuries as a literary and scholarly dialect (Amoraic Hebrew). However, during even its early phase, Rabbinic Hebrew had to vie with Aramaic and Greek, and it is known that large Jewish communities in Egypt apparently spoke Aramaic (Elephantine) or Greek (Alexandria) exclusively. Although the testimony of Jerome in the late 4th century A.D. indicates a good knowledge of Hebrew among his Jewish informants, the emergence, from the 3rd century B.C. onward, of Greek and Aramaic translations/interpretations of the Bible (*Septuagint, Targums*) is a sign of Hebrew's decline. Moreover, because written Hebrew gives relatively few indications of vocalization, there was a danger that unlearned Jews would forget even how to read their Scriptures properly let alone understand them. The situation was made yet more difficult by the existence of versions of the Bible containing different readings of the consonantal text and contentious interpretations of passages by the emerging Christian movement.

The Masoretes

The 6th to 8th centuries saw a flowering of activity among various schools of Masoretes ('bearers of tradition'), who can perhaps be regarded as religiously motivated linguistic theorists. Their aim was to safeguard against corruption of the consonantal text and to provide a system of 'pointing' the basically consonantal Hebrew script to represent how it was to be pronounced at both segmental and suprasegmental levels. One of the systems developed by the Masoretes of Tiberias became dominant and is used in the oldest surviving undamaged manuscript of the whole Hebrew Bible. This document, *Codex Leningradensis B19*^{A} from 1008–1009, is reproduced in the universally accepted critical edition of the corpus, *Biblia Hebraica Stuttgartensia*. Much earlier texts of parts of the Bible also exist, most notably the second century B.C. Isaiah Scroll from Qumran Cave 1 (unpointed). Texts employing other Masoretic traditions have also survived, and different pronunciations of Hebrew, as well as different trends in morphology, etc., are represented by the various communities of the diaspora (e.g., Ashkenazic, Sephardic, Yemenite).

Hebrew in the Diaspora

After its complete demise as the day-to-day spoken language of the Jewish people and until its 20th-century revitalization as the principal language of the modern State of Israel, Hebrew survived as a language spoken and written by Jews in most diaspora communities in synagogue worship and religious texts. Hebrew was used, for example, in ceremonial documents, such as Torah scrolls, Passover *haggādōt*, and texts inside phylacteries and *mĕzūzōt*, as well as in synagogue and grave inscriptions. With the exception of the sermon and the prayer for the Royal Family (in the UK), Orthodox synagogue services are conducted throughout the world in Hebrew. Elementary Hebrew is traditionally taught to children in a *ḥeder* or 'synagogue-school.' All orthodox Jewish males have to be sufficiently competent in Hebrew to read out loud a portion of Scripture at the age of *bar-mitzvā* (13 years), and, thereafter, when called upon, at ordinary synagogue services. Note as well that Hebrew is imparted within the family in the context of festivals like Passover and *Hanukkah*. At a much more advanced level, Hebrew is also used for instruction within rabbinic academies (*yĕshībhōt*).

Literature

The use of Hebrew by Jewish writers never died out, even though its geographical center shifted through time in accordance with the fate of Jewish communities in different countries. Scholars like Rashi, the great 11th-century French Bible commentator, wrote in Hebrew. Indeed, the 'dynamic' of Hebrew – the cause of its internal developments and its ability to adapt to new circumstances, most notably the need to provide a language for what would become the State of Israel – has been one of literature, not speech. In

the 12th to 13th centuries A.D., for example, the Ibn Tibbon family, through their translations of Arabic works, accommodated Hebrew to the expression of a wide range of philosophical and scientific topics. Although medieval and earlier literature is frequently religious (including material written at relatively short notice, such as *responsa* to problems arising within particular communities), there is also a wealth of Hebrew poetry, especially from Andalusia, on profane themes.

Secular Contexts

Hebrew was also used as a lingua franca for Jews from different parts of the world, as well as in correspondence and in credit notes, contracts, and other commercial and legal documents within Jewish communities. Records of the Spanish Inquisition attest to the use of Hebrew in oaths, etc., by forced converts to Christianity. From the late 18th century, the widespread use of Hebrew for secular composition developed with the *Haśkālā* or Jewish 'Enlightenment.' This had less to do with Hebrew's status as a lingua franca than with the Enlightenment's negative view of the Yiddish dialects of European Jewry, associated by the reformers with the socially disadvantaged status of Jews and their allegedly low level of cultural achievement. It has also been claimed that Hebrew was in daily use in Palestine during the 19th century.

Hebrew in Other Languages

Jews have usually spoken the dominant language of their host community, on occasions developing specifically Jewish languages/dialects (Yiddish, Ladino, etc.), in which Hebrew has sometimes been of great influence, at least in vocabulary. Where such a development has not taken place, or where a Jewish language/dialect has been superseded by the dominant language, it is in most cases misleading to speak of a Jewish dialect (or sociolect) of a non-Jewish language. But in this situation, Jews continue to use a number of Hebrew expressions for items of Jewish culture (e.g., *siddūr* 'prayer book', *tĕphillīn* 'phylacteries', *ṭallīt* 'prayershawl') and in particular contexts (e.g., *mazzāl ṭōbh* 'congratulations'). The Israeli pronunciation given here represents that used by younger members of Jewish communities, who also tend to use more Hebrew expressions. But the Hebrew pronunciation of older Jews and their vocabulary often reflects that of the Jewish language/dialect once used by themselves or their parents (e.g., Ashkenazic /kōshēr/ for Israeli /kāsh'ēr/ 'kosher', Yiddish *shul* for Hebrew *bēt-kĕneset* 'synagogue').

Classical Hebrew has left a few direct traces in the religious vocabulary of other languages, although this has been through the medium of Bible translations rather than that of Jewish communities (e.g., *hallelujah, amen, behemoth, shibboleth*). In the occult, various terms, for example, names for God and other supernatural beings, have been taken over, often in garbled form, from Hebrew. More significantly, the vocabulary and phraseology of the languages of Christian countries have been influenced in a variety of ways by loan-translations from Hebrew via prestigious early, fairly literal, vernacular translations of the Bible. Hebrew also underlies many 'Christian' names (e.g., *Isabel, David, John, Jeremy, Sarah*), and is encountered in some Jewish surnames (e.g., *Cohen, Levi, Rabinowitz*).

The Study of Hebrew within Christianity

Historically, Hebrew has gained the scholarly attention of Christians wanting to gain a better understanding of the Old Testament or to facilitate attempts at conversion of the Jews. Until the beginning of modern 'scientific' analysis of the Bible, few non-Jewish scholars could have claimed a familiarity with Hebrew or the ability to contribute to its linguistic analysis on anything approaching the scale of the medieval Jewish grammarians. But it is possible that their efforts aided the long survival of Hebrew, and it is in large measure due to them that Hebrew, elementary Biblical Hebrew at least, still finds a place in the curricula of many universities.

Hebrew as a Northwest Semitic Language

Hebrew, the language in which most of the books of the Bible were written, is one of the languages or dialects documented since the end of the second millennium B.C. in Southwest Asia, from Mesopotamia to South Arabia and Ethiopia, through the Syro-Palestinian area (*see* **Semitic Languages**). In comparison with other languages of the same family, Hebrew is a relatively young language: Old Accadian and Eblaite were documented in the East in the third millennium B.C., and Ugaritic was used in many literary texts from the middle of the second millennium B.C. in the Northwest; Hebrew was known only several centuries later, at the end of the second millennium B.C. As do Phoenician, Moabite, and other languages used by small populations of speakers, Hebrew belongs to the Canaanite group, in the northwest area of this region, although it shares isoglosses with languages (e.g., Old Aramaic) from a different group.

Because the oldest Semitic languages had no system of writing, their written forms were derived from other linguistic families. In the Northwest, under the influence of Egyptian elements, an alphabetic system was created in the first half of the second millennium B.C.; this system was the direct forerunner of Phoenician script. From this system originated, among others, the Old-Hebrew writing system, replaced in the second half of the first millennium B.C. by the Aramaic one. It had only 22 consonantal signs, and some of the original 29 Semitic phonemes were not represented in a separated way. There were no signs for vowels, and some consonantal or semivocalic signs were used in certain cases for indicating the presence of particular vowels.

Hebrew has preserved very scarce traces of the old Semitic nominal flexion. The genitive construction, with a *nomen regens*, usually in a reduced form (*status constructus*), followed by another one, *nomen rectum,* is shared with most Semitic languages. It is also common in Semitic languages for the verbal flexion to use preformatives, afformatives, or infixes for expressing diverse aspects and variant forms of the basic sense of the root, such as passive, causative, intensive, reflexive, and reciprocal meaning, or modes (indicative, subjunctive, jussive, energetic, etc.). Hebrew has reduced in many cases some of the older modes and possibilities.

Biblical Hebrew

The origin and character of Biblical Hebrew are currently an object of controversy. This language has been from its beginning united with the history of the Israelites, a group of seminomadic tribes progressively established in the country of Canaan. The oldest preserved manifestations of the language are a few biblical poems and some inscriptions (probably from the 9th century on). Hebrew adopted the Phoenician-Canaanite system of writing. There were some dialectal differences in the languages used by the different tribes and groups of tribes, especially between the North and the South tribes. In any case, Biblical Hebrew was a literary language, different in many aspects from the colloquial tongue, and very likely, as Chaim Rabin has suggested, a compromise language, created in the royal Chancellery of Jerusalem in the times of David and Solomon (10th century B.C.), that could be understood by the different groups of tribes, from the north and the south of the country of Canaan. In some books traces of a more colloquial

Hebrew as a Northwest Semitic Language

Hebrew, the language in which most of the books of the Bible were written, is one of the languages or dialects documented since the end of the second millennium B.C. in Southwest Asia, from Mesopotamia to South Arabia and Ethiopia, through the Syro-Palestinian area (*see* **Semitic Languages**). In comparison with other languages of the same family, Hebrew is a relatively young language: Old Accadian and Eblaite were documented in the East in the third millennium B.C., and Ugaritic was used in many literary texts from the middle of the second millennium B.C. in the Northwest; Hebrew was known only several centuries later, at the end of the second millennium B.C. As do Phoenician, Moabite, and other languages used by small populations of speakers, Hebrew belongs to the Canaanite group, in the northwest area of this region, although it shares isoglosses with languages (e.g., Old Aramaic) from a different group.

Because the oldest Semitic languages had no system of writing, their written forms were derived from other linguistic families. In the Northwest, under the influence of Egyptian elements, an alphabetic system was created in the first half of the second millennium B.C.; this system was the direct forerunner of Phoenician script. From this system originated, among others, the Old-Hebrew writing system, replaced in the second half of the first millennium B.C. by the Aramaic one. It had only 22 consonantal signs, and some of the original 29 Semitic phonemes were not represented in a separated way. There were no signs for vowels, and some consonantal or semivocalic signs were used in certain cases for indicating the presence of particular vowels.

Hebrew has preserved very scarce traces of the old Semitic nominal flexion. The genitive construction, with a *nomen regens*, usually in a reduced form (*status constructus*), followed by another one, *nomen rectum,* is shared with most Semitic languages. It is also common in Semitic languages for the verbal flexion to use preformatives, afformatives, or infixes for expressing diverse aspects and variant forms of the basic sense of the root, such as passive, causative, intensive, reflexive, and reciprocal meaning, or modes (indicative, subjunctive, jussive, energetic, etc.). Hebrew has reduced in many cases some of the older modes and possibilities.

Biblical Hebrew

The origin and character of Biblical Hebrew are currently an object of controversy. This language has been from its beginning united with the history of the Israelites, a group of seminomadic tribes progressively established in the country of Canaan. The oldest preserved manifestations of the language are a few biblical poems and some inscriptions (probably from the 9th century on). Hebrew adopted the Phoenician-Canaanite system of writing. There were some dialectal differences in the languages used by the different tribes and groups of tribes, especially between the North and the South tribes. In any case, Biblical Hebrew was a literary language, different in many aspects from the colloquial tongue, and very likely, as Chaim Rabin has suggested, a compromise language, created in the royal Chancellery of Jerusalem in the times of David and Solomon (10th century B.C.), that could be understood by the different groups of tribes, from the north and the south of the country of Canaan. In some books traces of a more colloquial

language can still be found, having characteristic traits of the language used in the North, as opposed to the standardized language of other Biblical books.

Biblical Hebrew was used as a living (literary) language during half a millennium. A recent study of the corpus of Biblical books has counted 450 934 Hebrew (with some Aramaic) words corresponding to 9981 terms (330 of them appearing only once). This means that only a reduced part of the living language has been preserved. Some of the words of the epigraphic texts of the epoch are not included in the Bible.

A few poetic texts of the Bible, such as the Song of Debora (Judges 5), the Song of Myriam (Exodus 15), the oracles of Bala'am (Numbers 23 and 24), the blessings of Jacob (Genesis 49), the blessings of Moses (Deuteronomy 33), etc., preserve some archaic elements that seem to be particularly connected to the Northern Israelite tribes and may reflect some of the typical dialectal traits of the region. These texts, and some epigraphic inscriptions from 9th century on, represent the most archaic samples of Hebrew in Biblical times. The most significant portion of the Biblical books was written in the classical prose used during the time of the Monarchy, whereas other prophetic and poetic texts were written between the 8th and 6th centuries B.C.E. It seems very likely that most of the writings received the final redaction during the exile in Babylonia or immediately after it.

The capture of Jerusalem, the destruction of the Temple built by Solomon, and the exile of the Judaic elites coincide with a notable reduction in the use of Hebrew and its diminishment as a living language. It was replaced in most places by Aramaic (even the old Canaanite script was replaced by the Aramaic one), and in the following centuries Biblical Hebrew was used only in artificial literary contexts or in prayers. The last Biblical books (some of them with parts in Aramaic) were written in the 2nd century. From that time on, Biblical Hebrew was employed, in a more or less artificial way, in a good number of the manuscripts found around the Dead Sea and in some literary genres written during the Middle Ages.

The differences in the diverse phases of Biblical Hebrew affected, for instance, orthography: because the points that marked the vowels were introduced only in the Middle Ages, diverse ways were developed for indicating certain vocalic sounds. In Archaic texts, for instance, the letter *–h* was used at the end of a word for marking the possessive pronoun *–o* 'his'; classical Hebrew uses *–w*. Postexilic Hebrew tends more to use the semi consonants *w, y,* for marking the presence of vowels (*scriptio plena*).

There are also differences in morphology: the poetic texts use archaic forms of suffix pronouns: *-(e)mo* (instead of the classic form *-(h)em*) 'to them.' In the old texts, it is possible to see traces of the Semitic nominal flexion that is practically nonexistent in the texts in classical Hebrew, whereas the prefixed article or the mark of direct object, *'et*, occurs much less frequently than in the prose texts of the Bible. The archaic relative pronouns *še-*, *ša-*, or *zeh*, *zo* / *zu* are in contrast with the classic *'ăšer*. Some archaic forms of the verb show that the old phase of the language is closer to other ancient Semitic languages. But the main forms ('conjugations') of the verb are stable along all the periods: beside the basic form, *qal*, there are the intensive *pi'el,* its passive *pu'al,* the causative *hif'il,* its passive *hof'al,* the passive *nif'al,* and the reciprocal *hitpa'el*. Particles are much scarcer in the archaic texts than in the later prose texts.

From the point of view of syntax, differences are observed in the use of some verbal forms, such as the preformative conjugation with an enclitic *wa-*. Archaic Hebrew prefers paratactic, asyndetic constructions, whereas later Hebrew adds many new particles and has preference for syndetic, hypotactic sentences.

The last Biblical books were written after the Exile in Babylonia, from the 6th to the 2nd centuries B.C., imitating the old classical, preexilic models, but without having direct contact with a living language, and under the influence of Aramaic and the spoken colloquial Hebrew that would be used by the Rabbis for their teaching and their discussions. Changes in the verbs include the rare use of the absolute infinitive and ultra-long verbal forms, or the reduction of the forms with conversive *waw*. The particles also change in a significant way, replacing some old forms with new ones and increasing in use. The lexicon also shows notable modifications, with many new words and loans from other close languages.

A particular form of late Biblical Hebrew can be seen in the manuscripts found around the Dead Sea. In 1947, seven old scrolls were found in a cave close to the remains of Jirbet Qumran; this was followed by the discovery of many other scrolls (almost 800 in a more or less fragmentary form, with Biblical and non-Biblical texts). Most of them were attributed to an Essenian sect that lived in the area in the 2nd and 1st centuries B.C., whereas others are considered to be from the time of the revolt of Bar-Kokba, in the 2nd century A.D. The language of most writings is close to late Biblical Hebrew, with some linguistic peculiarities.

Biblical Hebrew has evolved from different traditions that developed during the Middle Ages in the largest Jewish communities, in Palestine or in Babylon. These traditions adopted different systems of vocalization and represented different pronunciations

of Hebrew, and in some cases, small morphological changes. The Hebrew text of the Bible as vocalized and annotated by the Masoretes in Tiberiah (Galilee) has become the standard form of Biblical Hebrew.

Medieval Hebrew

A form of colloquial Hebrew that had been in use after the Exile had its literary reflex in the *Mishnah* and other rabbinical writings completed in the first centuries A.D. In the early Middle Ages, however, most Jewish communities had adopted Aramaic first, and from the 7th century on used Arabic or the languages of the host countries in their daily life and cultural expressions. Thanks to the study of biblical grammar and lexicography, the literary usage of Hebrew increased noticeably from the 10th century on, particularly in al-Andalus, within the Iberian Peninsula.

In al-Andalus, the western end of the Islamic empire, Jewish intellectuals who were using Arabic as their everyday language used Hebrew in their writings, and especially in their new poetry, inspired by the techniques of Arabic poets. Hebrew, for the Jews of Sepharad (the Iberian Peninsula), was a sign of identity and an instrument of cultural expression, not only in the traditional biblical and rabbinic fields of study, but also in new cultural forms that paralleled the best achievements of the dominant language, Arabic. The Bible served Jewish poets as a stylistic and linguistic model. The genres in prose could be written in the same tongue, but for dealing with technical subjects, such as science, medicine, or philosophy, and even in many cases for philological studies, the poets preferred Judeo-Arabic. Hebrew was employed as a kind of lingua franca for mutual understanding only in exceptional cases (for instance, when a Jewish traveler went from one community to another in far away regions).

The linguistic ideal for most Andalusian Jewish scholars was the 'pure language' – that is, the Hebrew of the Bible, used in the correct grammatical way and without any change or innovation; this excluded, in particular, the language of the rabbinical writings and the daring innovations of the synagogal poetry of the Byzantine epoch. This 'puristic' trend became particularly apparent in the secular poetry written at the end of the 11th century and during the first half of the 12th century, 'the golden age' of Hebrew poetry. The practice did not exclude the deep influence of Arabic. In the medieval secular poetry, quotations and expressions taken from the Bible were blended together with motives, images, and technical words coming from Arabic.

The medieval pronunciation of Hebrew in the regions under Islamic domain conformed in general to the rules or usages collected by the Tiberian Masoretes (who added vowels and accents to the consonantal text), with some peculiarities, such as the reduction from seven to five vowels. The influence of Arabic was especially clear in the pronunciation of the guttural and emphatic consonants, and also in the syntax, whereas the morphology followed, in general, the biblical patterns.

The Jews from the north of the Iberian Peninsula, Provence, and Italy developed a Hebrew literary prose and wrote in Hebrew their literary correspondence, ethical, exegetical, and philosophical treatises, polemics, books on history or travels, and scientific and medical writings. They also signed public documents and wrote notes on their commercial activities in Hebrew. Due to the limited number of words preserved in the biblical books, when some Jews, familiar with Islamic culture, translated scientific, philosophical, and philological works written in Arabic (by both Arabs and Jews) into Hebrew, they had to introduce new words into the old language to make it more flexible. These translators, especially the Tibbonid family in the south of France in the 12th and 13th centuries, enriched the language with many new words and lexical calques.

In the Christian kingdoms of Europe, the Jewish communities of northern France and the Rhine valley (Ashkenaz) adopted the local language of this region, Middle High German, and blended it with Romance (French) and Hebrew elements to form Yiddish, written in the Hebrew alphabet. Medieval Ashkenazi Jews used Hebrew mostly for prayer and for some juridical, ethical, and exegetical writings; it was not the pure biblical language, but a rather miscellaneous language, intermingled with rabbinic Hebrew and Aramaic, without well-defined grammatical rules, and with some influence from the vernacular languages. The Ashkenazi developed their own pronunciation of Hebrew, different from what was usually heard in Palestine or in the Islamic Empire.

Basic Information

The Israeli language (a.k.a. Modern Hebrew) is one of the official languages – with Arabic and English – of the state of Israel, established in 1948. It is spoken to varying degrees of fluency by its 6.8 million citizens (as of September 2004) – as a mother tongue by most Israeli Jews (whose total number slightly exceeds 5 million), and as a second language by Muslims (Arabic speakers), Christians (e.g., Russian and Arabic speakers), Druze (Arabic speakers), and others.

Hebrew (*see* **Hebrew, Biblical and Medieval**) was spoken by the Jewish people after the so-called conquest of Israel (c. 13th century B.C.). Following a gradual decline (even Jesus, 'King of the Jews,' was a native speaker of Aramaic rather than Hebrew), it ceased to be spoken by the 2nd century A.D. The Bar-Kokhba Revolt against the Romans, which took place in Judaea in A.D. 132–135, marks the symbolic end of the period of spoken Hebrew. For more than 1700 years thereafter, Hebrew was comatose – either a 'sleeping beauty' or 'walking dead.' It served as a liturgical and literary language and occasionally also as a lingua franca for Jews of the Diaspora, but not as a mother tongue.

Israeli emerged in Eretz Yisrael (or Palestine) at the beginning of the 20th century. Its formation was facilitated by Eliezer Ben-Yehuda, schoolteachers, and others to further the Zionist cause. Earlier, during the Haskalah (enlightenment) period from the 1770s to the 1880s, writers such as Méndele Mokhér Sfarím (Shalom Abramowitsch) produced works and neologisms which eventually contributed to Israeli. However, it was not until the early 20th century that the language was first spoken.

The genetic classification of Israeli has preoccupied linguists since the language emerged. The traditional school argues that Israeli is Semitic: (Biblical/Mishnaic) Hebrew revived. Educators, scholars, and politicians have contributed to this assumption, linking the history of language to the politics of national revival. The revisionist position, by contrast, defines Israeli as Indo–European: Yiddish relexified, i.e., Yiddish (the revivalists' mother tongue) is the 'substratum,' whilst Hebrew is only a 'superstratum' providing the lexis and lexicalized morphology (cf. Horvath and Wexler, 1997). A more recent hypothesis is that Israeli is a hybrid language, both Semitic and Indo–European. It argues that both Hebrew and Yiddish act equally as its primary contributors (rather than 'substrata'), accompanied by many secondary contributors: Russian, Polish, German, Judeo–Spanish (Ladino), Arabic, English, etc. (see **Figure 1**). Although Israeli phonetics and phonology are primarily Yiddish and its morphology is mainly Hebrew, the European contribution to Israeli is not restricted to particular linguistic domains and is evident even in its morphology.

Thus, the term 'Israeli' is far more appropriate than 'Israeli Hebrew,' let alone the common signifiers 'Modern Hebrew' or 'Hebrew' *tout court* (cf. Zuckermann, 1999, 2003, 2005).

Grammatical Profile

Israeli is a fusional synthetic language, with discontinuous, nonconcatenative morphemes with vowel infixation, for example:

Figure 1 The Israeli hybrid hypothesis.

yoháv
*love.*3M.SG.FUT
'(he) will love'

mitahévet
*fall-in-love.*3F.SG.PRES
'(she) is falling in love'

yenadvú
*volunteer.*3PL.FUT
'(they) will volunteer (others)'

hitnudávti
*volunteer.*1SG.PAST.COERCIVE/INDUCIVE (*hit-a-é-* + *-u-á-*)
'I (was) volunteered (by force)'

However, Israeli is much more analytic than (Biblical/Mishnaic) Hebrew. Whereas the Hebrew phrase for 'my grandfather' was *sav-í* 'grandfather–1.SG.POSS,' in Israeli it is *sába shel-ì* 'grandfather GEN–1SG.' Still, Israeli sometimes uses the Semitic feature known as 'construct-state' (Israeli *smikhút*), in which two nouns are combined, the first being modified or possessed by the second. For example, *repúblikat banánot*, literally 'republic bananas,' refers to 'banana republic.' However, unlike in Hebrew, the construct-state is not highly productive in Israeli. Compare the Hebrew construct-state *ʔem ha-yéled* 'mother DEF-child' with the more analytic Israeli phrase *ha-íma shel ha-yéled* 'DEF-mother GEN DEF-child,' both meaning 'the mother of the child,' i.e., 'the child's mother.'

Israeli is a head-marking language. It is nominative–accusative at the syntactic level and partially also at the morphological level. As opposed to Biblical Hebrew – whose constituent order is VAO(E)/VS(E) – but like Standard European and English, the usual constituent order of Israeli is AVO(E)/SV(E). Thus, if there is no case marking, one can resort to the constituent order. Israeli is characterized by an asymmetry between definite Os and indefinite Os. There is an accusative marker, *et*, only before a definite O (mostly a definite noun or personal name). *Et-ha* is currently undergoing fusion and reduction to become *ta*. Consider:

taví	*l-i*	***et***	***ha-séfer***
give.2M.SG.IMP (puristically FUT)	DAT-1SG	ACC	DEF-book

'give me the book,'

where *et*, albeit syntactically a case marker, is a preposition, and *ha* is a definite article. This sentence is realized phonetically as *taví li* ***ta-séfer***.

Israel's first Prime Minister, David Ben-Gurion, did not like the *et* particle and would have liked to have replaced *taví li* ***et ha-séfer*** with *taví li* ***ha-séfer***. (It has been suggested that he was not keen on diplomatic relations with ***et****yópya* 'Ethiopia' for the same reason.) However, such a puristic attitude is hardly ever seen these days and *taví li* ***ha-séfer*** is nonnative.

Sound System

Israeli has five vowels: /i, e, a, o, u/. Its consonantal inventory reflects Yiddish (except that the latter has syllabic consonants). Unlike Hebrew, the pharyngealized (emphatic) consonants ק [*q*], ט [*ʈ*], and צ [*s̪*] have been neutralized and are pronounced [k], [t], and [s] respectively. Hebrew ע [ʕ], א [*ʔ*], and ה [h] are all 'pronounced' by most Israelis in the same way: most of the time, they are not pronounced. They are only pronounced (both ע and א as [*ʔ*], and ה as [h]) when in a postconsonantal position **within uncommon words**. Israeli ה [h] is also pronounced by some speakers at the beginning of phrases. The Hebrew alveolar trill ר [r] is pronounced in Israeli as a unique uvular approximant [ʁ̞], similar to the [ʁ] in many Yiddish dialects. For dyslexics, Israeli is much more problematic than Hebrew, the reason being that while Israeli's phonetic system is primarily European, it still uses a phonetically anachronistic Hebrew orthography. Thus, one should not be too surprised to see an Israeli child spelling עקבותיו (pronounced *ikvotáv*) 'his traces' as אכווטב.

Whereas the syllable structure of Hebrew was CV(X)(C), that of Israeli is (C)(C)(C)V(C)(C)(C). Israeli does not follow Hebrew spirantization rules. For example, most Israelis say *bekitá bet* rather than the puristic *bekhitá bet* 'in the second grade.' The stress is phonemic, e.g. *bóker* 'morning' and *bokér* 'cowboy.'

Nouns

Israeli nouns show number, normally only singular and plural. Each noun is either masculine or feminine, the latter often being created by adding a suffix to the unmarked masculine. For instance, whereas *mazkír* is 'male secretary,' *mazkirá* is 'female secretary' (note the addition of *-a*). Similarly, whilst *profésor* is 'male professor,' *profésor**it*** is 'female professor.' Pronouns have 'case forms' consisting of a preposition plus a suffix: nominative (e.g., *aní* 'I'), accusative (*otí* 'me'), dative (*li* 'to me') and genitive (*shelí* 'my'). However, NPs which are not pronouns do not bear case marking. The only exceptions are the above-mentioned accusative marker *et* (or *ta*), and the lexicalized allative ('to/towards') case (which, serendipitously, is based on the historical accusative case), e.g., *báit* 'house' → *ha-báyt-a* 'to the house'; *yerushaláim* 'Jerusalem' → *yerushaláym-a* 'to Jerusalem'; *tsafón* 'north' → *tsafón -a* 'to the north.' New allative phrases, e.g., *tel avív-a* 'to Tel Aviv', are not used unless one is trying to sound flowery or jocular.

Adjectives agree in number, gender, and definiteness with the nouns they modify, e.g.:

ha-yéled ha-gadól
DEF-boy *DEF-big*
'the big boy';

yelad-ím gdol-ím
boy-M.PL *big-M.PL*
'big boys.'

Verbs

As opposed to Biblical Hebrew, which had only a perfect–imperfect distinction, Israeli has three tenses: past, present, and future. In the past and future, verbal forms differ according to gender, number, and person. However, in the present tense, verbs are conjugated only according to gender and number and there is no person distinction. The historical reason is that the forms of the Israeli present can be traced back to the Hebrew participle, which is less complex than the historical perfect and imperfect forms.

Verbs are transitive, intransitive or ambitransitive (labile). Ambitransitivity is usually of the S=A type, e.g. *dan shatá etmòl* 'Dan$_s$ drank yesterday' (cf. *dan shatá etmòl bíra* 'Dan$_s$ drank yesterday beer$_o$'). However, owing to Americanization, there are more and more ambitransitive verbs of the S=O type, e.g., *ha-séfer mokhér tov* 'the-book$_s$ sells well' (cf. *grísham mókher et ha-séfer tov* 'Grisham$_s$ sells ACC the-book$_o$ well'); *yésh po máshehu she-meríakh ra* 'There.is here something$_s$ that-smells bad' (cf. *aní meríakh po máshehu ra* 'I$_s$ smell here something$_o$ bad').

Clauses

The main clause in Israeli consists of (a) clause-initial peripheral markers, e.g., discourse markers; (b) NP(s) or complement clause(s); (c) a predicate – either verbal, copular, or verbless; (d) clause-final peripheral elements, e.g. discourse markers. The only obligatory element is the predicate, e.g., *higáti* 'arrive:1SG.PAST.' Sentences (1), (2), and (3) are examples of a verbal, copular, and verbless clause, respectively.

(1) אסתר אכלה תפוח.
[ester]$_A$ {[akhlá]$_V$ [tapúakh]$_O$}
[Esther]$_A$ {[eat:3F.SG.PAST]$_V$ [apple]$_O$}
'Esther ate an apple'

(2) אסתר היא אחות שלי.
[ester]$_{CS}$ {[hi]$_{COP}$ [akhót shel-î]$_{CC}$}
[Esther]$_{CS}$ {[COP.F.SG]$_{COP}$ [sister GEN-1.SG]$_{CC}$}
'Esther is my sister'

(3) אסתר חכמה.
[ester]$_{VCS}$ {[khakham-á]$_{VCC}$}
[Esther]$_{VCS}$ {[clever-F]$_{VCC}$}
'Esther is clever'

There are many types of subordinate clause, e.g., adverbial (denoting comparison, time, place, condition, concession, reason, result, goal, state), adjectival/relative, nominal/complement. On complementation clauses in Israeli, see Zuckermann (forthcoming).

Concluding Remarks

The grammatical profile of Israeli demonstrates its binary nature, which has important theoretical implications for many branches of language science: contact linguistics, sociolinguistics, language revival/survival, linguistic genetics and typology, creolistics, and mixed languages. Genetic affiliation – at least in the case of (semi-)engineered, 'nongenetic' languages – is not discrete but rather a continuous line. The comparative method and lexicostatistics, though elsewhere useful, are not here sufficient. Linguists who seek to apply the lessons of Israeli to the revival of no-longer spoken languages should take warning.

Israeli affords insights into the politics not only of language, but also of linguistics. One of the practical implications is that universities, as well as Israeli secondary schools, should employ a clear-cut distinction between Israeli linguistics and Hebrew

linguistics. Israeli children should not be indoctrinated to believe that they speak the language of Isaiah – unless the teacher is referring to the 20th-century Israeli polymath and visionary Isaiah Leibowitz. Although revivalists have engaged in a campaign for linguistic purity, the language they created often mirrors the very cultural differences they sought to erase. The study of Israeli offers a unique insight into the dynamics between language and culture in general and in particular into the role of language as a source of collective self-perception.

Biblical Hebrew Lexicography

The Early Period

The beginnings of Hebrew lexicography, more than a thousand years ago, were closely accompanied by the beginnings of Hebrew grammatical description, and both are linked to the name of Rav Saadiah Gaon (Egypt and Babylonia, 882–942). His dictionary *Ha-Egron* (902; Nehemiah Allony edition, 1969), only a fifth of which has survived, was rather short, and many of its entries were translated into Arabic. While not intended, therefore, to be a bilingual dictionary in the modern sense, this is actually what it was, at least to some extent. A supplement was appended in which the words were sorted by their last letter, as was commonly done in dictionaries of Arabic (for rhyming purposes). Another Hebrew-Arabic dictionary from the 10th century is *Kitab Jame' al-Alfaz* by the Karaite David ben-Abraham el-Fassi, written in Jerusalem between 930 and 950 in two versions, a long one and a short one (the latter was published by Skoss in 1936).

The first Hebrew–Hebrew dictionary was written somewhat later by Menahem ben-Saruq (Spain, mid-10th century), and it provoked a flurry of debates, initiated by the criticisms of his contemporary Dunash ben-Labrat, both on some fine points of grammar and on some explanations of biblical terms. Among other things Dunash asserted, for example, that the root of YGWN *yagon* 'distress' is GN while Menahem claimed it to be the one-letter root G (see **Table 1** for the method of transcription used in this article). These criticisms were answered by Menahem's pupils, and the dispute was finally decided by R. Yaacov ben-Meir (known as Rabbenu Tam, France, 12th century). Both these

Table 1 The Hebrew alphabet

א	aleph	`	ו	waw	W	כ	kaf	K	ע	ayin	ʿ	ש	shin	š
ב	bet	B	ז	zayin	Z	ל	lamed	L	פ	pe	P	ת	tav	T
ג	gimal	G	ח	het	Ḥ	מ	mem	M	צ	tsadi	Ṣ			
ד	dalet	D	ט	tet	Ṭ	נ	nun	N	ק	qof	Q			
ה	he	H	י	yod	Y	ס	samekh	S	ר	resh	R			

In order to give the reader as faithful a picture as possible of the Hebrew words cited, they are represented in up to three forms: a letter-per-letter transliteration (when needed) in small capitals, as per this table; the pronunciation in italics; and an English translation.

Reuben Sivan (1965), and the Hebrew–German dictionary of Jaacov Lavy (1975). Special mention should be made of the dictionaries published by Hayim Baltsan for Hebrew–Russian and Hebrew–English, intended for Hebrew learners who hear Hebrew words but have difficulties in conceiving their spelling, so the entries are Russian/English phonetic equivalents of the Hebrew words, and the dictionary is sorted alphabetically by the transcribed entries.

Computerized Resources

Quite a number of computerized resources are now available for Hebrew. Regarding corpora, the following should be mentioned:

- *Maba'*, the Bar Ilan University Corpus of Modern Hebrew, which contains 199 books (novels and short stories), a full one-year set of issues of a local weekly magazine, news items from the Internet, collected articles from a daily newspaper, and the full minutes of six months' sittings of the Knesset, totaling in all 25 million words of modern Hebrew;
- the corpus of the Academy of the Hebrew language of early Hebrew writings (mentioned above);
- The Responsa Corpus of Bar Ilan University, available also on CDs to the general public, which contains many hundreds of books of rabbinical literature in Hebrew and Aramaic, encompassing almost 2000 years of writings and originating from all over the world.

Similar CD corpora of (different) rabbinical books have also been circulated in recent years in Israel, too numerous to mention here. In terms of software, two operational programs, both developed by Yaacov Choueka and the Rav-Milim team, can be mentioned: *Milim*, a program for the complete and accurate lemmatization and morphological analysis of any word in Modern Hebrew, and *Nakdan*, a program for the automatic vocalization of Hebrew texts with an accuracy of 98%.

Finally, a government-supported Knowledge Center for Processing Hebrew has recently been established at the Technion in Haifa, whose mission is to research and produce tools necessary for the intelligent processing of Modern Hebrew, including the building of appropriate tagged corpora and the dissemination of reliable operational software for such processing.

Heidegger, Martin (1889–1976)

G Moretti, Rome, Italy

© 2006 Elsevier Ltd. All rights reserved.

In the past 30 years, the abundance of literature that has been dedicated to Heidegger throughout the world gives us a clear measure of the significance of his contribution to philosophy. Heidegger's works have been translated into every major language, regardless of the intriguing linguistic peculiarities that distinguish them.

In 1924, Heidegger summarized Aristotle's biography as follows: "He was born, he worked, and he died." The same concept could be applied to Heidegger himself. In fact, for him life and work coincided in a way that was almost unparalleled among the authors of the 1900s. After examining the early stages of his own philosophical development, which culminated

between 1913 and 1915 in two publications, one on the psychologism of logic and one on Duns Scotus, Heidegger concluded that the questions of 'being' and of 'language' were already emerging in those early works, even though the works were youthful in character and still a long way from the themes that would absorb his attention in the future. The confrontation with the legacy of phenomenology and of neo-Kantianism (Husserl, Rickert, and Lask) (*see* **Husserl, Edmund (1859–1938)**) that characterized the early period of Heidegger's philosophical work culminated in the publication of his famous 1927 work, *Sein und Zeit*. In later years, both Hölderlin and Nietzsche appear to have influenced his thought, even though that is not always evident or uncontroversial; in point of fact, between 1934 and 1945, Heidegger dedicated important university courses to both philosophers. During that time, he began to lay the foundations of his future philosophical thought. The year 1934 witnessed his "rectorship interlude," in every way a sort of brief political and scientific adventure. The episode has been the object of excessive speculations on the part of some scholars and, as a consequence, has been somewhat overemphasized.

Upon his resigning as Rector of the University of Freiburg, Heidegger was subjected to a sort of 'isolation' within his own country, which lasted until the end of World War II. As a consequence, between 1935 and 1945 he published very little – in particular, *Platons Lehre von der Wahrheit* (1942), *Vom Wesen der Wahrheit* (1943), and *Erläuterungen zu Hölderlins Dichtung* (1944). In addition, the subsequent ban from further teaching precluded the circulation, at least until 1950, of whatever Heidegger had written in Germany during the war. Hence, of significance was the publication of his *Brief über den "Humanismus"* (1946), which allowed him to free his thought, publicly and clearly, from any 'existentialist' interpretation. The latter, in the wake of Marcuse's and Sartre's writings, had been progressively taking hold first in France, and afterward in other European countries, as well as in the English-speaking world.

The observations regarding the concept of 'truth' (*aletheia,* in Greek), and particularly the history of the West, since the time of Plato, allowed Heidegger to reconstruct, not only in the 1946 writing but in almost every work, the entire history of philosophy by summarizing it into the nonneutral notion of 'metaphysics.' According to Heidegger, this coincided with the history of the so-called *Seinsvergessenheit*, or 'forgetting of Being,' a 'movement' that was historically determined as well as inevitable. Therefore, 'truth' – whose original meaning, according to Heidegger, was 'openness' to the feeling of Being (hence Heidegger's translation of *aletheia* into the German *Unverborgenheit*) – is slowly but constantly constrained, and even forced into the connotation of 'correctness' (*orthotes* in Greek). This modification has allowed the technicality associated with modern and contemporary science (especially with Galileo and Descartes, [*see* **Descartes, René (1596–1650)**]) to overshadow the original philosophical idea of 'truth' as openness and is therefore responsible for the rise of the modern world as we know it.

From 1950 on, Heidegger's focus on the question of technicality was intertwined with his observations on the language of philosophy, and poetry in particular. According to Heidegger, poetry's role is to "say Being" in a way that is precise as well as original: that of the 'sacred.' Poetry can accomplish such a task without having to tie 'Being' exclusively to 'presence,' that is, to its practical significance in the human and natural worlds. In doing this, Heidegger went back to what he had already stated in his 1927 work, where he had made a clear distinction between the 'authentic' being-in-the-world (*in-der-Welt-sein*) and the 'inauthentic' one. Such interpretative curvature of his thought was particularly evident in his 1959 volume *Unterwegs zur Sprache,* which has often, yet erroneously, been defined by some scholars as an 'aesthetic' shift or as a 'literary' one, in general. In the years between 1950 and 1975, Heidegger's important observations, often delivered at public conferences, on poets such as Rilke, Trakl, Hebel, and George, attest not only to the deepening of this curvature but also to his great interest in the linguistic development of German poetry. This is also reflected in an exchange with the Jewish poet Paul Celan, although the outcome of such exchange was not a positive one.

Heidegger concluded his philosophical journey by alluding to an 'end' of philosophy that would coincide with the end of metaphysics and with the possible rise of a 'new' thought. This thought is relative to its being interpreted not as any other entity but as *Ereignis*. Such an allusion, in a way, compelled Heidegger to start a discourse with other scholars and with disciplines that by tradition had not always been able to communicate, such as physics, art history, linguistics, literary critique, and historiography. This approach often garnered important, although controversial, results. It is worth mentioning the numerous disagreements Heidegger had with some of the philologists of the time regarding his etymologic interpretation of certain Greek words, particularly of the term *aletheia*. As a consequence of this and other factors, Heidegger's legacy to philosophy likely constitutes one of the richest platforms for the philosophical thought of the century that has recently ended and of the one that has just begun. It is in fact

through Heidegger that the so-called hermeneutic perspective, which characterizes in some ways the continental way of philosophizing, is able to communicate with the 'analytic' perspective (*see* **Kant, Immanuel (1724–1804)**) typical of the Anglo-Saxon tradition.

Heine, Bernd (b. 1939)

D Stein, Heinrich-Heine-Universitaet Duesseldorf, Duesseldorf, Germany

© 2006 Elsevier Ltd. All rights reserved.

Bernd Heine earned his Ph.D. in 1967 from Cologne University, with a thesis on Togorest languages, and in 1971 completed his Habilitation, also at Cologne University, with a thesis on pidginization in the Bantu language area. After teaching in Nairobi, he was appointed to the Chair of African Linguistics at Cologne University. He has held several visiting teaching positions in many parts of the world, is a member of several distinguished academies of science, and has been awarded a number of fellowships, among them the election as a member of the British Academy, of the Australian Research Council, as well as of the Nordrhein-Westfälische Akademie der Wissenschaften. He is president of the Standing Committee for the World Congress of African Linguists. As one of the world's leading Africanists, with extensive experience of field work in several African countries, he is to be credited with the promotion of the study of Khoisan languages as an area worthy of special focus. Another descriptive center of his work is his consistent emphasis on the importance of language contact phenomena in African languages. He is the leading figure in establishing African linguistics as a center of empirical and theoretical interest from the point of view of typology, structure, and sociolinguistics. His other, more theoretical, interest is centered on the concept of grammaticalization. Through a long series of articles and books, he has become one of the founders of grammaticalization theory and has promoted the study of grammaticalization to an area of major interest. Grammaticalization, the path from regular lexical items through ever more grammatical items, is conceived of not as a static state, but as a permanent dynamic process cutting across different types of morphemes and word classes.

In a synthesis of his positions on language contact and grammaticalization, Heine has held that grammaticalization and language contact should not be regarded as mutually exclusive, but as complementary major processes involved in linguistic change. The principles of grammaticalization are manifested irrespective of the involvement or not of language contact. It therefore appears to be the inherently 'stronger' process.

As regards the origin and shape of linguistic categories, Heine has consistently taken a semantic and functional stance. With the main function of language being to convey meaning, the structuring of language must make reference to this function, thus to factors lying outside language itself and relating to more general processes underlying human conceptualization and communication.

Helmholtz, Hermann Ludwig Ferdinand von (1821–1894)

J Rauschecker, Georgetown University Medical Center, Washington, DC, USA

© 2006 Elsevier Ltd. All rights reserved.

Hermann von Helmholtz was arguably one of the 19th century's greatest scientists and one of the most important physiologists of all time. According to one of his biographers, Helmholtz was "the last great scholar whose work, in the tradition of Leibniz, embraced all the sciences, as well as philosophy and the fine arts" (Turner, 1990). His unique strength was "the ability to integrate mathematical, theoretical and instrumentational elements into a complex yet unified structure" (Cahan, 1993).

He was born Hermann Helmholtz on August 31, 1821 in Potsdam, Germany, the eldest of four children of August Ferdinand Julius Helmholtz and Caroline Helmholtz, née Penn (descended from William Penn, the founder of Pennsylvania). He attended Potsdam Gymnasium, where his father taught philology and classical literature. His main interest was in physics, but his father persuaded him to study medicine at the Royal Institute of Medicine and Surgery in Berlin, because government scholarships were available in that subject area. He also attended lectures in chemistry and physics (by Gustav Magnus) at Berlin University, taught himself mathematics and philosophy (with emphasis on Fichte and Kant), and learned to play piano with a skill that later helped him in his work on the sensation of tone (O'Connor and Robertson, 2001). In his doctoral thesis (1842), at age 21, he argued strongly for physiology and medicine to be founded on the natural sciences, rejecting the existence of separate 'vital forces.' Such vitalism was advocated by most biologists in those days, including his own thesis adviser and lifelong mentor, Johannes Müller, the discoverer of the law of specific nerve energies. Müller did demand, however, "an empirical foundation for all scientific concepts" from his students (Königsberger, 1965). Helmholtz was encouraged in his views by his fellow students Emil Heinrich Du Bois-Reymond, who was to be the founder of experimental neurophysiology, and Ernst Wilhelm von Brücke.

Five years after finishing his thesis, Helmholtz published an influential paper (*Über die Erhaltung der Kraft*, 1847) in which he formulated the mathematical law of the conservation of energy, which Joule had postulated qualitatively earlier. The paper made him famous, he returned to Berlin with the help of Alexander von Humboldt, and in 1849, at age 28, he accepted the chair of physiology at Königsberg and also married Olga von Velten. He invented the ophthalmoscope in 1851, which gained him an international reputation. In the following years, he published his *Handbuch der Physiologischen Optik* (Vol. 1, 1856) and his theory of trichromatic color vision, which extended the work of Thomas Young and ended in a famous controversy with Ewald Hering, who advocated an 'opponent-color' theory. (Later studies proved both right.)

In 1855, Helmholtz was appointed chair of anatomy and physiology in Bonn. A leading world scientist, he transferred to Heidelberg in 1858 with the lure of a new Institute of Physiology. He was elected Fellow of the Royal Society in 1860. His wife died in 1859, and Helmholtz remarried in 1861 to Anna von Mohl, with whom he eventually had three children. While in Heidelberg, Helmholtz worked on physiological acoustics, publishing major studies about the perception of sound and on musical theory (e.g., Helmholtz, 1863). In mathematical appendices he advocated the use of Fourier series for the analysis of complex sounds.

In 1871 (one year after the death of Gustav Magnus), Helmholtz took over the chair of physics in Berlin and devoted most of his time to the study of physics (thermodynamics, electrodynamics, and electromagnetism). In 1877 to 1878 he served as Rector of the university, which position he used to speak publicly about such diverse but equally important topics as academic freedom and sensory perception (Helmholtz, 1877; 1878). In 1882 he was elevated to the nobility by Kaiser Wilhelm I, and in 1888 he

Hermann von Helmholtz was arguably one of the 19th century's greatest scientists and one of the most important physiologists of all time. According to one of his biographers, Helmholtz was "the last great scholar whose work, in the tradition of Leibniz, embraced all the sciences, as well as philosophy and the fine arts" (Turner, 1990). His unique strength was "the ability to integrate mathematical, theoretical and instrumentational elements into a complex yet unified structure" (Cahan, 1993).

He was born Hermann Helmholtz on August 31, 1821 in Potsdam, Germany, the eldest of four children of August Ferdinand Julius Helmholtz and Caroline Helmholtz, née Penn (descended from William Penn, the founder of Pennsylvania). He attended Potsdam Gymnasium, where his father taught philology and classical literature. His main interest was in physics, but his father persuaded him to study medicine at the Royal Institute of Medicine and Surgery in Berlin, because government scholarships were available in that subject area. He also attended lectures in chemistry and physics (by Gustav Magnus) at Berlin University, taught himself mathematics and philosophy (with emphasis on Fichte and Kant), and learned to play piano with a skill that later helped him in his work on the sensation of tone (O'Connor and Robertson, 2001). In his doctoral thesis (1842), at age 21, he argued strongly for physiology and medicine to be founded on the natural sciences, rejecting the existence of separate 'vital forces.' Such vitalism was advocated by most biologists in those days, including his own thesis adviser and lifelong mentor, Johannes Müller, the discoverer of the law of specific nerve energies. Müller did demand, however, "an empirical foundation for all scientific concepts" from his students (Königsberger, 1965). Helmholtz was encouraged in his views by his fellow students Emil Heinrich Du Bois-Reymond, who was to be the founder of experimental neurophysiology, and Ernst Wilhelm von Brücke.

Five years after finishing his thesis, Helmholtz published an influential paper (*Über die Erhaltung der Kraft*, 1847) in which he formulated the mathematical law of the conservation of energy, which Joule had postulated qualitatively earlier. The paper made him famous, he returned to Berlin with the help of Alexander von Humboldt, and in 1849, at age 28, he accepted the chair of physiology at Königsberg and also married Olga von Velten. He invented the ophthalmoscope in 1851, which gained him an international reputation. In the following years, he published his *Handbuch der Physiologischen Optik* (Vol. 1, 1856) and his theory of trichromatic color vision, which extended the work of Thomas Young and ended in a famous controversy with Ewald Hering, who advocated an 'opponent-color' theory. (Later studies proved both right.)

In 1855, Helmholtz was appointed chair of anatomy and physiology in Bonn. A leading world scientist, he transferred to Heidelberg in 1858 with the lure of a new Institute of Physiology. He was elected Fellow of the Royal Society in 1860. His wife died in 1859, and Helmholtz remarried in 1861 to Anna von Mohl, with whom he eventually had three children. While in Heidelberg, Helmholtz worked on physiological acoustics, publishing major studies about the perception of sound and on musical theory (e.g., Helmholtz, 1863). In mathematical appendices he advocated the use of Fourier series for the analysis of complex sounds.

In 1871 (one year after the death of Gustav Magnus), Helmholtz took over the chair of physics in Berlin and devoted most of his time to the study of physics (thermodynamics, electrodynamics, and electromagnetism). In 1877 to 1878 he served as Rector of the university, which position he used to speak publicly about such diverse but equally important topics as academic freedom and sensory perception (Helmholtz, 1877; 1878). In 1882 he was elevated to the nobility by Kaiser Wilhelm I, and in 1888 he

became director of the newly founded Physikalisch-Technische Reichsanstalt in Berlin-Charlottenburg, a post he held for the rest of his life.

Students and research associates of Helmholtz included Heinrich Hertz, Max Planck, Wilhelm Wien, Arthur König, Henry Rowland, A. A. Michelson, and Michael Pupin. Helmholtz's studies in sensory physiology formed the basis of the work of Wilhelm Wundt, also a student of Helmholtz, who is considered one of the founders of experimental psychology.

The direct relevance of Helmholtz's work for language research is twofold:

1. *On the sensations of tone* (18XX) is usually cited for its fundamental importance for the understanding of hearing, the function of the cochlea and inner ear, and for making a connection between auditory physiology and music perception. Its contributions, however, go far beyond that. The work comments on almost every aspect of hearing and auditory perception, including to a great degree on the phonetics and phonology of speech (speech perception and production) in the section 'Über die Klangfarbe der Vocale.' Reference is made to earlier vowel theories of Willis and Donders and, in the English translation of 1885, of Wheatstone, Alexander Graham Bell (inventor of the telephone), and his father Melville Bell. Drawing an analogy between music and speech, Helmholtz explained the functioning of the human larynx as a reed instrument and understood the vocal tract as a series of resonators. On that basis, he developed a theory of speech synthesis more than 100 years before Klatt (see Klatt, 1987). In a section on 'Artificial vowels,' an experimental apparatus consisting of tuning forks and resonators is introduced that can successfully imitate speech sounds (first introduced in the *Münchener Gelehrte Anzeigen* on June 20, 1859). Regarding the perception of complex sounds, Ohm had stated the fundamental principle of physiological acoustics in 1843, concerned with the way in which we perceive combination tones. One of Ohm's critics, the physicist August Seebeck, tried to discredit Ohm's law by pointing out that we are unable to separate the harmonics in a combination tone. Helmholtz resolved the conflict by pointing out that there is 'synthetic perception' and 'analytic perception,' and compared the inability to perceive complex tones analytically with the inability to separate wavelength in composite colors. By making this distinction, Helmholtz preempted the 'synthetic' perception of complex sounds in higher areas of the auditory system, which is necessary for the perception of speech and music, without giving up Ohm's principle of Fourier analysis, which is implemented in peripheral hearing.

2. Helmholtz's second contribution was his lucid comparison of language and perception, both in terms of representational systems and in terms of their acquisition. He stressed how the formation of our perceptions is similar to the way in which we learn language. One of Helmholtz's declared goals was to investigate "the laws according to which ... sensations result in mental images of determinate external objects, that is, in perceptions" (Helmholtz, 1863). His investigations resulted in a strongly empiricist view that rejected Kant's philosophy that the concepts of time, space, and causation are innate (*a priori*) mental attributes reflecting divine reason. Helmholtz instead advocated Locke's view that all knowledge comes through the senses. Space in particular, according to Helmholtz, is a learned, not innate, concept. As an example, he cites the fact that "the blind can form complete intuitions of space without the aid of vision"(1878). Helmholtz went on to say that "there is a most striking analogy between the entire range of processes of visual perception ... and another system of [arbitrary] signs – I mean the words of our mother tongue" (1873–1881). In learning how to speak, a child must first "guess that the sounds it hears are intended to be signs at all; next, the meaning of each separate sound must be found out, by the same kind of induction as the meaning of the sensations of sight or touch ..." (1896). Some have compared Helmholtz's concept of 'signs' (a modern term would be 'mapped representations') with that of Wittgenstein (see Hyder, 1998).

Hemon, Roparz (1900–1978)

P-Y Lambert, The Sorbonne, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

Born in Brest (Finistère) in 1900, Louis-Paul Nemo very soon became interested in the Breton language which was spoken by his grandparents. After spending some time in Britain learning English, he went to Paris to study for a degree in English (1922–1925). There he began to write essays in Breton under the pseudonym Roparz Hemon. He founded a literary journal in Breton, *Gwalarn* ('West,' or 'West wind'), which became the organ of a new cultural movement promoted by young writers. Inspired by their Breton nationalism, they all wanted to create a new Breton literature. Roparz Hemon was their leader. Completely devoted to the Breton revival, he was then far from being a linguist: what he considered his duty was to write very short grammars and dictionaries for the use of beginners. He had the utmost contempt for the professors who were studying the older states of Celtic languages without paying any attention to the living languages. What he deemed important in linguistics is what is called sociolinguistics, the study of the historical conditions of the decay of the Breton language, and the linguistic survey of Breton speakers. He also had some personal ideas about what should be done to create a Breton literature.

During the Allied forces' bombing of Brest in 1941 his house was destroyed and he lost his rich Breton library. The German occupation seemed to him to be the unique opportunity to restore the Breton language and culture: he agreed to collaborate, first as a radio speaker, then as the president of the newly founded Keltisches Institut in Rennes (1941–1944), an organization promoted by the Germans to seduce and unify all the different political and cultural Breton movements. He tried to unify the written language and proposed a new spelling (its main feature is the use of-zh- for what is pronounced /z/ in most dialects, but /h/ in the Vannes dialect). Arrested in 1945 and charged with 'cultural collaboration,' he was sentenced to ten years of 'indignité nationale,' which meant he could not work as a teacher anymore. He was also banned from Brittany. Later on he received a post in the Dublin Institute for Advanced Studies, where he began a scholarly and scientific career editing older texts and compiling a vast historical dictionary of Breton, published in roneotyped fascicles. It was quite a surprise for those who had read his venomous attacks against Celtic scholars and Celtic philology, in the first issues of *Gwalarn*. His *Historical morphology and syntax of Breton*, conceived as a traditional grammar, suffers from a lack of information both on the sources used, and on the relevant literature: the author seems to have systematically ignored what had been written before him, by Joseph Loth (*see* **Loth, Joseph (1847–1934)**), and *Le verbe breton* by Pierre Le Roux (*see* **Le Roux, Pierre (1874–1975)**), and others. His scientific work is restricted to two modest, but useful handbooks. He will be mainly remembered as a leader of the Breton cultural movement, to which he devoted his life with extreme courage.

Hemon, Roparz (1900–1978)

P-Y Lambert, The Sorbonne, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

Born in Brest (Finistère) in 1900, Louis-Paul Nemo very soon became interested in the Breton language which was spoken by his grandparents. After spending some time in Britain learning English, he went to Paris to study for a degree in English (1922–1925). There he began to write essays in Breton under the pseudonym Roparz Hemon. He founded a literary journal in Breton, *Gwalarn* ('West,' or 'West wind'), which became the organ of a new cultural movement promoted by young writers. Inspired by their Breton nationalism, they all wanted to create a new Breton literature. Roparz Hemon was their leader. Completely devoted to the Breton revival, he was then far from being a linguist: what he considered his duty was to write very short grammars and dictionaries for the use of beginners. He had the utmost contempt for the professors who were studying the older states of Celtic languages without paying any attention to the living languages. What he deemed important in linguistics is what is called sociolinguistics, the study of the historical conditions of the decay of the Breton language, and the linguistic survey of Breton speakers. He also had some personal ideas about what should be done to create a Breton literature.

During the Allied forces' bombing of Brest in 1941 his house was destroyed and he lost his rich Breton library. The German occupation seemed to him to be the unique opportunity to restore the Breton language and culture: he agreed to collaborate, first as a radio speaker, then as the president of the newly founded Keltisches Institut in Rennes (1941–1944), an organization promoted by the Germans to seduce and unify all the different political and cultural Breton movements. He tried to unify the written language and proposed a new spelling (its main feature is the use of-zh- for what is pronounced /z/ in most dialects, but /h/ in the Vannes dialect). Arrested in 1945 and charged with 'cultural collaboration,' he was sentenced to ten years of 'indignité nationale,' which meant he could not work as a teacher anymore. He was also banned from Brittany. Later on he received a post in the Dublin Institute for Advanced Studies, where he began a scholarly and scientific career editing older texts and compiling a vast historical dictionary of Breton, published in roneotyped fascicles. It was quite a surprise for those who had read his venomous attacks against Celtic scholars and Celtic philology, in the first issues of *Gwalarn*. His *Historical morphology and syntax of Breton*, conceived as a traditional grammar, suffers from a lack of information both on the sources used, and on the relevant literature: the author seems to have systematically ignored what had been written before him, by Joseph Loth (*see* **Loth, Joseph (1847–1934)**), and *Le verbe breton* by Pierre Le Roux (*see* **Le Roux, Pierre (1874–1975)**), and others. His scientific work is restricted to two modest, but useful handbooks. He will be mainly remembered as a leader of the Breton cultural movement, to which he devoted his life with extreme courage.

Henderson, Eugénie J. A. (1914–1989)

L Plug, University of York, Heslington York, UK

© 2006 Elsevier Ltd. All rights reserved.

Eugénie Henderson was born in Newcastle in 1914. A specialist in the languages of Southeast Asia, she became the first female professor of phonetics in Britain in 1964. She retired in 1982 and died in London in 1989.

Henderson was introduced to phonetics at University College London (UCL) in the early 1930s. Daniel Jones, Professor of Phonetics at UCL, offered her private tuition and encouraged her to investigate the phonetics of Siamese. In 1938, he appointed Henderson assistant lecturer in the Department of Phonetics.

During the war, Henderson moved to the London School of Oriental and African Studies (SOAS). In 1942, she was appointed Lecturer in Phonetics in the Department of Phonetics and Linguistics, where she assisted J. R. Firth, later Professor of General Linguistics at SOAS, in running Japanese courses for army personnel. After the war, she decided against returning to UCL and in 1946 became a senior lecturer at SOAS, where she spent the remainder of her career.

The postwar years saw the development at SOAS of prosodic analysis, an approach to phonology that abandoned autonomous, segmental phonemic analysis as practiced, for example, by Jones, instead focusing on the interaction between phonetics and other levels of analysis, such as morphology and syntax, and assigning phonetic features to structural units throughout the linguistic hierarchy, such as the syllable and phrase. Henderson played an important role in its development and propagation; most notably, her *Prosodies in Siamese* was cited prospectively in Firth's 'Sounds and prosodies' (1948) and is widely considered the most convincing exposition of the prosodic approach.

Henderson was appointed Reader in Phonetics in 1952 and headed the Department of South East Asia and the Islands and the Department of Phonetics and Linguistics throughout the 1960s. In 1964, she obtained a professorship in phonetics. In her inaugural lecture, published as *The domain of phonetics* (1965a), she described phonetics as a branch of general linguistics best practiced alongside work in other linguistic disciplines. Her *Tiddim Chin* (1965b), an analysis of two texts based on fieldwork in Burma, was another comprehensive demonstration of this approach, with phonetic description informed by, and informing, grammatical analysis.

Like Firth, Henderson saw many of her linguistic views anticipated by the 19th-century phonetician Henry Sweet. She regularly cited Sweet in her teaching, and in 1971 she published a selection from his writings, taking its title, *The indispensable foundation*, from Sweet's description of the place of phonetics in linguistics.

Henderson's empirical work covered numerous varieties of Southeast Asian as well as Caucasian, Indo–Iranian, and Austronesian languages. In her retirement, she collated materials collected earlier for a Karen dictionary, but she died before completing the project, weeks after the publication of a festschrift in her honor, appropriately titled *South-east Asian linguistics*.

Herder, Johann Gottfried (1744–1803)

D Candel, Université Paris 7, Paris, France

© 2006 Elsevier Ltd. All rights reserved.

Born in Mohrungen, East Prussia, the son of a choirmaster and teacher, Johann Gottfried Herder went to Königsberg in 1762 and studied theology and philosophy with Kant and Hamann. He became involved in a critical examination of both Kant's rationality and Hamann's irrationality. In Riga in 1764, he taught at the cathedral school, then took up a position as a minister. He became well known for his essays and reviews, outlining a history of classical poetry from a universal–historical point of view (*Fragmente über die neure deutsche Literatur*, 1767–1768). He criticized the leading figures of both the Enlightenment and church orthodoxy. In *Kritische Wälder* (1769), he praised the freedom of arts and language.

He traveled in Europe in 1769 and spent four months in Nantes reading French Enlightenment authors. In his *Journal meiner Reise im Jahre 1769* (1769), an important text of the 'Sturm und Drang' literary movement, he looked at a universal history of ideas, transformed into pedagogical concepts. He visited Brussels, Antwerp, Leiden, Amsterdam, Hamburg (where he met Lessing), Euten, Darmstadt, Lübeck, and Strasbourg, where he met Goethe (1771); in Paris, he came close to French artistic life; he criticised the Encyclopedists, as did the German Romantics.

The Berlin Academy of Sciences raised the question of the origin of language, asking (1769) if man, left to his natural capacities, could invent language and by which means? (Introduction to Herder, 1772, reprint 1995: "En supposant les hommes abandonnés à leurs facultés naturelles, sont-ils en état d'inventer le langage? Et par quels moyens ... ?" Herder introduced his essay with the first part of this question: "Haben die Menschen, ihren Naturfähigkeiten überlassen, sich selbst Sprache erfinden können?") Herder's *Abhandlung über den Ursprung der Sprache*, was distinguished by the academy out of 30 propositions (and published in 1772).

Herder's role in literature expanded through his friendship with Goethe and the influence he had on him. Herder became a preacher at the court of the ruling house in Bückeburg (1771) and was married the year he formulated, in *Von deutscher Art und Kunst* (1773), an artistic ideal of intense passion, typical of the 'Sturm und Drang' movement; he adhered to this ideal mostly in his adaptations of what he called '*Volkslieder*.' Herder rejected an artificial divide between the common people ('*Volk*') and the intellectual elite, celebrating folk culture and folk literature and defending simple language based on the vernacular. Through Goethe's intervention, he became general superintendent of the Lutherian clergy in Weimar in 1776.

Ideen zur Philosophie der Geschichte der Menschheit (1784–1791), a most famous work in philosophy of history, showed his interest in continuity, development, and origins, and was criticized by Kant. Among others, he published *Zerstreute Blätter* (1785–1797), *Briefe zur Beförderung der Humanität* (1793–1797), *Christliche Schriften* (1794–1798), and translations (*Der Cid*, 1802–1803). *Metakritik zur Kritik der reinen Vernunft* (1799) was an empiricist attack on Kant's theoretical philosophy.

For Herder, language reflected the national character of its speakers (as in *Fragmente*), and this was similar to Humboldt's ideas. In the *Abhandlung*, he discussed Süssmilch's thesis about the divine source of language, and Condillac's theory about humans' animal-like biology being the source of language. He asserted language was not God-given but man-made. He suggested that the origin of language was a combination of gesture and natural reflex cries, developing into regular utterances, then into poetry. A specific human quality enabled man to identify an object by selecting the features which characterize it (the lamb is identified by its bleat, and the observer bleats mentally when seeing a lamb: this process contributes to language). Herder's idea was: let's accept this aptitude as a gift of nature; the key to human nature is the ability to perceive and to differentiate, the key to it is language, thought and language being bound together.

Herder had a big influence as a philosopher, a historian of literature, and a philosopher of language, due to his empirical approach to languages, his psychological theory of interpretation, his sense for variation, his rejection of normative judgments ("Jeder Mensch muss ... jeden Begriff in jedem Wort so verstehen, als wenn er ihn erfunden hätte," *Journal meiner Reise*, 1769). In 1784, in his philosophy of history, Herder reacted against the naturalism of his *Abhandlung*, and against the 'Aufklärung' movement, turning toward a sociology of language. This made a serious contribution toward including languages in the study of human evolution. Herder was between tradition and innovation; according to him, every linguistic system presented one 'vision of the world,' a 'Weltanschauung,' an 'internal form' of language. The genius of a language is at the same time the genius of a people's literature. True poetry draws from popular and national heritage.

He claimed France was decadent : "Man wohnt auf den Ruinen," "Die grosse Ernte ist vorbei" (*Journal meiner Reise*, 1769) (nevertheless, he placed the French language above all, even above Latin!). Herder also appeared as leading from a cultural nationalism to a political one. National Socialism easily managed to appropriate Herder's nationalist interpretation of *Volk* and *Nation*.

But opinions about Herder changed; uses of the term *Volk* have been reinterpreted. His universal perception of culture, his theory of diversity of languages, integrated in culture and life of nations, are greatly appreciated. His *Metakritik* (1799) even offered a system of grammatical categories, derived from fundamental and universal functions of sensible experience. We may learn from him concerning linguistic diversity, cognitive activity, and creativity.

Hermeneutics

A Cardew, University of Essex, Colchester, UK

© 2006 Elsevier Ltd. All rights reserved.

Hermeneutics, the systematic study of interpretation, enjoys an uncertain status midway between an art and a science. It takes its name from the Greek messenger god Hermes, and the early use of ἑρμηνεύς 'interpreter' as it appears in Plato.

The first work that deals with interpretation as a process of principled enquiry is Aristotle's *On Interpretation* [Περὶ ἑρμηνίας], which is from that part of the *Organon* that deals with categories and logic. Aristotle is primarily concerned with designating nouns and verbs, and making extant the grammatical construction of propositions. He seeks to arrive at a procedure for the affirmation or denial of statements, and a reliable method for avoiding contradiction within and between statements. Aristotle's *Poetics* and the *Rhetoric* reflected on the organization of discourse, its ability to persuade, and its use of schemes and figures such as metaphor, metonymy, irony, and antithesis. Such rigorous, rhetorical analysis of speeches and written texts was the major approach to language in the classical period. To this, in later antiquity, there was gradually added a rudimentary philology; a regard for original meaning and its temporal modification, and in the Library at Alexandria, there developed rules of consistency in understanding and editing texts.

These developments became vital for the early church in the establishment of a canon of Christian texts, which had to be separated from an abundance of apocrypha and reliably translated. Important organizing principles of consistency, such as the belief that the New Testament realized the prophecies of the Old, made it possible to perceive a symmetry and completeness in Biblical texts, as well reduce the prolixity of interpretations. The pursuit of allegorical readings of the Pentateuch, such as those of Philo, attempted to reconcile Hebrew texts with Hellenistic philosophy by adducing a series of hidden meanings,

He claimed France was decadent : "Man wohnt auf den Ruinen," "Die grosse Ernte ist vorbei" (*Journal meiner Reise*, 1769) (nevertheless, he placed the French language above all, even above Latin!). Hermeneutics, the systematic study of interpretation, enjoys an uncertain status midway between an art and a science. It takes its name from the Greek messenger god Hermes, and the early use of ἑρμηνεύς 'interpreter' as it appears in Plato.

The first work that deals with interpretation as a process of principled enquiry is Aristotle's *On Interpretation* [Περὶ ἑρμηνίας], which is from that part of the *Organon* that deals with categories and logic. Aristotle is primarily concerned with designating nouns and verbs, and making extant the grammatical construction of propositions. He seeks to arrive at a procedure for the affirmation or denial of statements, and a reliable method for avoiding contradiction within and between statements. Aristotle's *Poetics* and the *Rhetoric* reflected on the organization of discourse, its ability to persuade, and its use of schemes and figures such as metaphor, metonymy, irony, and antithesis. Such rigorous, rhetorical analysis of speeches and written texts was the major approach to language in the classical period. To this, in later antiquity, there was gradually added a rudimentary philology; a regard for original meaning and its temporal modification, and in the Library at Alexandria, there developed rules of consistency in understanding and editing texts.

These developments became vital for the early church in the establishment of a canon of Christian texts, which had to be separated from an abundance of apocrypha and reliably translated. Important organizing principles of consistency, such as the belief that the New Testament realized the prophecies of the Old, made it possible to perceive a symmetry and completeness in Biblical texts, as well reduce the prolixity of interpretations. The pursuit of allegorical readings of the Pentateuch, such as those of Philo, attempted to reconcile Hebrew texts with Hellenistic philosophy by adducing a series of hidden meanings,

Huponoia, which were often at alarming variance with the surface meaning. The dogma of the early church sought to establish an order and discipline in such readings, and hermeneutics became the area of theology concerned with this task.

A tradition of understanding and interpretation gradually developed, but this tradition was never entirely secure as we can see in Dante's multileveled allegory, explained in his *Letter to Can Grande*, and in the Renaissance taste for 'mysterious meanings,' in which the veiled obscurity of hermeticism, rather than unambiguous truth of clear exposition, seems to be the real goal.

The Reformation challenged the accepted practices of theological hermeneutics. Refusing to be bound by the instituted Catholic doctrine of tradition and asserting the interpretive freedom of the inspired individual soul, Lutheran exegesists developed a procedure of interpretation that recognized the vital role of the person making the interpretation. In *The idea of the good interpreter* (1630) Johann Dannhauer proposed a '*hermeneutica generalis,*' a universal hermeneutics that could be applied to all texts.

Both of these strands, the general and the particular, were developed by the chief modern exponent of hermeneutics, Friedrich Daniel Ernst Schleiermacher (1768–1834). Schleiermacher united the Kantian principle of the synthetic power of the mind to make sense of the world with a careful philological and grammatical examination of individual texts. The 'higher criticism' of contemporary exegesis sought to synthesize sacred writing on the basis that it was fundamentally the work of one unchanging Divine Author, however the incarnation of Christ at a particular moment, 'the *Kairos,*' meant that historical time and events also had a crucial importance for interpretation. This perspective is reflected in Schleiermacher's attention to the varieties of language used by individual Gospels, John being more Greek than Hebrew, and Luke being essentially Greek, and also how language as a system changed through time. To attain full understanding, one had to consider the meaning and usage of words at a particular time. Schleiermacher cited I. Cor. 12 in support of the idea that the Holy Spirit changes perspective from time to time, and from one human vessel to another. Schleiermacher reconciled the synchronic, the diachronic, and the eternal in his hermeneutic and also developed what he termed an art, '*Kunstlehre,*' of 'avoiding misunderstanding.' The most noted principle of Schleiermacher's art is the 'hermeneutic circle' in which the whole, whether it be an entire text or a context of language use, is understood through the examination of particular individual usage and texts, and conversely an individual passage or text is understood by looking at its general context or the whole text; the whole conditions the particular and the particular the whole.

Schleiermacher's chief successor in philosophical hermeneutics, Wilhelm Dilthey (1833–1911), continued the process of secularization, using hermeneutics as the basis for human sciences, *Geisteswissenschaften*, which proceed through understanding of the meaning of phenomena, in contrast to the physical sciences, which proceed through the explanation of phenomena. Individual expression and meaning is formed by the prevailing worldview, *Weltanschauung*, of a particular place and time, and by considering this formation objectively, it is possible for hermeneutics to understand an individual author better than he understood himself. So, Dilthey's vast biography of Schleiermacher painstakingly recapitulates Schleiermacher's ideas in their context. From this point, much hermeneutic thought becomes concerned with its own development.

In the 20th century, Paul Ricouer identified the 'hermeneutics of suspicion' in the work of Marx, Nietzsche, and Freud, who interpreted individual consciousness to be largely a deception wrought by the forces of production, the will to power, and the unconscious respectively. The interpreter has to meet guile with double guile and overcome the resistances and distortions of individual expression, so revealing the precarious abyss of truth that lies beneath the surface. Additional suspicious interpretation is the deconstruction of texts in the work of de Man and Derrida.

In the same period, the ontological hermeneutics of Martin Heidegger sought to uncover the historical nature of Being, and his pupil Paul Gadamer developed the notion of *Horizontverschmelzung*, the merging of the life worlds of the interpreter and the interpreted.

Latterly, Umberto Eco has tried to find a way of limiting and containing the proliferation of hermeneutic readings, and those deconstructive interpretations which seem, however sophisticated, to be at variance with plain sense.

Hervás y Panduro, Lorenzo (1735–1809)

G Hapler, University of Potsdam, Potsdam, Germany

© 2006 Elsevier Ltd. All rights reserved.

Lorenzo Hervás y Panduro was born in Horcajo de Santiago, a small village near Cuenca (Spain) on May 10, 1735, and died in Rome, Italy, on August 24, 1809. He joined the Jesuit Order at the age of 11 and pursued a typical career, passing his novitiate in the Colegio de la Corte, studying theology and philosophy at the University of Alcalá de Henares, and being ordained as a priest in 1760. After teaching in Cáceres, Madrid, and Murcia, this period of his life was concluded by the expulsion of the Jesuits from Spain in 1767. Hervás went to Italy (Cesena, Rome) and started working on a large encyclopedia of mankind, which was published in Italian and included an early catalogue of the known languages of the world. Later Hervás published a much more extensive catalogue of the languages of the world in Spanish. The material classified by Hervás had been collected by his fellow monks while working as missionaries in foreign countries. Language descriptions, as well as translations of religious and catechist texts provided by this exceptional setting, were much more comprehensive than any personal linguistic experience could have been. Hervás became a member of the Royal Academy of Dublin and of the Etruscan Academy of Cortona, theologian to the Cardinal Albani, librarian of Pope Pius VII, and finally member of the Basque Economic Society.

Hervás' studies on the theory of language are subordinate to his attempt to create a synthesis between religious dogma and the new Enlightenment culture and philosophy. In this context, Hervás accepted empiricist methods of cognition and discussed common 'ideological' topics, such as the observation of communication among deaf people and the functional description of the relations between language and thought. Discussing subjects such as the origin of language and the relations between languages, thinking, and history of a people, Hervás did not conceal the contradictions between his fundamental position and the arguments borrowed from current linguistic theories. What helped him to reconcile Enlightenment theories of language with the biblical account of its origins was an emphasis on the arbitrary nature of language signs. It is especially the arbitrariness of the linguistic sign, along with diversity in language, that proves divine intervention. If men had developed language on their own, there would have been no differences among languages, because the same sense organs would have led to the same results everywhere. On this basis, a collection of the different languages of the world would become a collection of empirical evidence of the divine creation of language and the duality of language and thought. Following this anthropological objective of the catalogue,

Hervás y Panduro, Lorenzo (1735–1809)

G Hapler, University of Potsdam, Potsdam, Germany

© 2006 Elsevier Ltd. All rights reserved.

Lorenzo Hervás y Panduro was born in Horcajo de Santiago, a small village near Cuenca (Spain) on May 10, 1735, and died in Rome, Italy, on August 24, 1809. He joined the Jesuit Order at the age of 11 and pursued a typical career, passing his novitiate in the Colegio de la Corte, studying theology and philosophy at the University of Alcalá de Henares, and being ordained as a priest in 1760. After teaching in Cáceres, Madrid, and Murcia, this period of his life was concluded by the expulsion of the Jesuits from Spain in 1767. Hervás went to Italy (Cesena, Rome) and started working on a large encyclopedia of mankind, which was published in Italian and included an early catalogue of the known languages of the world. Later Hervás published a much more extensive catalogue of the languages of the world in Spanish. The material classified by Hervás had been collected by his fellow monks while working as missionaries in foreign countries. Language descriptions, as well as translations of religious and catechist texts provided by this exceptional setting, were much more comprehensive than any personal linguistic experience could have been. Hervás became a member of the Royal Academy of Dublin and of the Etruscan Academy of Cortona, theologian to the Cardinal Albani, librarian of Pope Pius VII, and finally member of the Basque Economic Society.

Hervás' studies on the theory of language are subordinate to his attempt to create a synthesis between religious dogma and the new Enlightenment culture and philosophy. In this context, Hervás accepted empiricist methods of cognition and discussed common 'ideological' topics, such as the observation of communication among deaf people and the functional description of the relations between language and thought. Discussing subjects such as the origin of language and the relations between languages, thinking, and history of a people, Hervás did not conceal the contradictions between his fundamental position and the arguments borrowed from current linguistic theories. What helped him to reconcile Enlightenment theories of language with the biblical account of its origins was an emphasis on the arbitrary nature of language signs. It is especially the arbitrariness of the linguistic sign, along with diversity in language, that proves divine intervention. If men had developed language on their own, there would have been no differences among languages, because the same sense organs would have led to the same results everywhere. On this basis, a collection of the different languages of the world would become a collection of empirical evidence of the divine creation of language and the duality of language and thought. Following this anthropological objective of the catalogue,

Hervás declared languages to be the best criterion for the classification of peoples. According to Hervás, there are three areas in which languages can differ: words, grammatical structure (*el artificio gramatical*), and pronunciation. Each of them can be useful in the comparison of languages and the classification of peoples, but the most reliable criterion is grammatical structure. The stability of grammar makes it a suitable guideline for the classification of peoples.

Hesitation Phenomena and Pauses

A Simpson, University of Jena, Jena, Germany

Disfluency

Conversations involve two or more speakers producing utterances partly in succession, partly in overlap. Utterances must be formulated in real time in response to the immediate demands of the interaction. It is in the nature of such a complex task that the participants in a conversation will make errors during their turn at talk and face problems formulating and producing utterances in a short enough space of time. A typical problem is difficulty in finding an appropriate word or expression. If this problem arises when a speaker has already begun talking then the fluent production of an utterance must be temporarily suspended while an appropriate word or expression is looked for: the speaker hesitates. One might think that a speaker could accomplish this task by stopping talking and remaining quiet until an appropriate word or expression is found and then resuming their talk. However, speakers use a number of phonetic strategies which signal to other participants in the conversation that they are experiencing problems, but at the same time attempting to hold the floor.

This article describes the phonetic shape of some of the hesitation strategies used in English and other languages.

Pauses

Daniel Jones, a well-known British phonetician from the first half of the 20th century, considered pauses to have two main functions: "Pauses are continually made in speaking. They are made chiefly (1) for the purpose of taking breath, and (2) for the purpose of making the meaning of the words clearer" (Jones, 1969: 274).

Jones considered both kinds of pauses to be taken at major syntactic boundaries such as the end of

clauses or sentences. Although Jones didn't specify this, it soon becomes clear when we look at conversation that his description can only really be applied to a text being read out loud. Later research has shown that pauses have a wealth of different forms and functions in natural spoken discourse.

Some of the earliest and most important work to investigate hesitation and pauses was carried out by Goldman-Eisler in the 1950s and 1960s. The most important results of this research are described in Goldman-Eisler (1968). She drew her spontaneous speech from a number of sources: description of cartoon strips; discussions with adults and juveniles; psychiatric interviews. She also used controlled experiments, such as measuring the time it takes for a speaker to produce a word missing from a sentence. She hypothesized that hesitation could arise from three distinct areas in utterance planning:

- **content:** what the speaker wants to say;
- **syntax:** what order to place the words in;
- **lexis:** choice of words to use to express the semantic content.

One of the main findings to come out of this work was that pauses occur most frequently before content word classes such as nouns, etc., i.e., those places where the range of possibilities is greatest.

Although an unfilled pause represents a period of acoustic and auditory silence, it need not be a period of articulatory inactivity. Research on English conversation has shown that the way in which a speaker starts and ends a pause provides important information for other participants as to whether a turn is finished or not. In particular, by initiating a pause in a particular way a speaker can hold his/her turn despite the silence. Local and Kelly (1986) analyzed a number of pauses that occurred after conjunctionals, such as *but, well, so*. In a previous study of the same data, Jefferson (1983) had come to the conclusion that pauses after such items could involve talk being continued by the same speaker (= intra-utterance pause) or were considered by another speaker to be a legitimate location at which to begin his/her turn.

Local and Kelly showed that the pauses following conjunctionals fell into two different phonetic classes which correlated with different interactional behaviour: 'holding' and 'trail-off' silences. In the first, intrautterance 'holding' pause, the speaker begins the pause with glottal closure and holds this closure until the beginning of the next word after the pause. In the second type ('trail-off') there was no glottal closure, at the beginning of the pause. There was often an audible outbreath after the conjunctional, and speakers reduced tempo and loudness during the four or five syllables before the pause.

Um-ing and er-ing – Filled Pauses

Dictionaries generally include one or more entries describing sounds made when speakers hesitate. So, for instance, the Collins English Dictionary contains the entries *um* and *er* as "a sound made when hesitating in speech."

In addition to merely producing silent pauses of different types when hesitating, speakers often explicitly verbalize that they are experiencing difficulties by producing *er* or *um*. They have variously been called hesitation particles, editing terms, or merely filled pauses (in contrast to silent pauses).

One interesting feature of hesitation particles is that they are unlike the regular words of a language. This is not surprising, as one of their main functions is to signal that a speaker is having problems with finding the appropriate words. One question that remains unclear is the way in which hesitation particles fit into the sound systems of different languages. Levelt (1983, 1989) suggests that the vowel of hesitation particles in some languages may represent the neutral position of the vocal tract, whereas in others, the distinct noncentral vowel suggests that the form has become lexicalized, i.e., it is treated as a full-blown word of the language. He suggests that this is likely to be the case for Swedish [ɛ]. Likewise, the back open [ɑ] used in Chinese or the front rounded [ø] heard in French are both vocalic items that are distant from any neutral vocal tract position.

Although Levelt's division into lexicalized particles and neutral vowel particles is appealing, the division is problematic. Speakers of both German and English use hesitation particles with central vowels; however, acoustic studies (Shriberg, 1994; Pätzold and Simpson, 1995) for both languages have shown that the vowel qualities, despite being in the central area of the vowel space vary too much between speakers to be representative of a speaker's neutral vocal tract position. Pätzold and Simpson (1995) looked in detail at the hesitation particles produced by a small sample of North German speakers and found that the vowel qualities between speakers varied greatly. However, the vowels did share one important property: they were not the same quality as the vowels found in the regular lexical items of the speakers. Likewise, Shriberg (1994) found a similarly large variability in vowel qualities in a large corpus of spontaneous American English.

Other phonetic aspects of hesitation particles also set them apart from the words of a language. The

Figure 1 Sonagram of the conversation extract ''oh ich seh' grad äh ich hab' am Montag äh eigentlich immer zwei Stunden was vor'' (''oh I see I always have something for two hours Mondays'') spoken by a North German male. The extent of the two hesitation particles ''äh'' are marked in gray.

syllables are often longer and louder than the most heavily accented lexical syllables in an utterance. Extract (1) is taken from the Kiel Corpus (IPDS, 1995–1997) and illustrates well the hesitation particles used by a speaker in a typical conversational turn (Hesitation particles are marked in gray, is an audible in-breath).

(1) Montag den vierten äh siebenten vierundneunzig dann die Vorbereitung schön ja bleibt nur noch festzulegen oh ich seh' grad äh ich hab' am Montag äh eigentlich immer zwei Stunden was vor äh das wär' also besser könnten wir's dann vielleicht auf den Dienstag verschieben ist zwar'n bisschen knapp mit der Zeit da wir schon am Mittwoch los sollen aber vielleicht Dienstag den fünften.

(Monday the fourth seventh ninety-four then the preparation good right all that's left now is oh I see I always have something for two hours Mondays so it would be better perhaps to move it to the Tuesday it's a bit tight as we're supposed to leave on Wednesday but perhaps Tuesday the fifth).

Figure 1 contains oscillogram and sonagram of an extract from the turn in (1). This extract contains two hesitation particles, again marked in red. Comparison of these portions with the syllables of the words reveal that the vowels in the hesitation particles are longer and have relatively stable qualities.

Sound Duration and Quality

Two further phonetic strategies used by speakers to signal problems in utterance formulation are sound duration and sound quality. One of the most common examples of this in English is in the particular pronunciation of the definite article *the*. In fluent speech, *the* has two forms in many varieties of British English: [ði] before vowels, e.g., [ðijʌðəz] *the others* and [ðə] before consonants, e.g., [ðəbʊk] *the book*. However, in conversation at places where a speaker is experiencing problems, the form [ðiː] is often found, regardless of whether the following word begins with a consonant or a vowel.

(2) that he spent two years as director of thi: y laeng uh what do you call it, thi:y you know, the thing that Arthur Delaney. started, in Kuwait (S.2.14.330). [example from Svartvik and Quirk used in Fox Tree and Clark, 1997: 159].

Fox Tree and Clark (1997) examined different forms of *the* ([ðə, ði, ðiː]) in relation to different types of disfluency in a large corpus of British English conversation (Svartvik and Quirk, 1980). An example of a conversational extract used from the corpus containing different forms of *the* (in red) is shown in (2). Fox Tree and Clark's most important finding was that after 81% of 'the' pronounced as [ði] or [ðiː] speech was suspended. By contrast, such a suspension was only found in 7% of cases in which *the* was pronounced as [ðə]. They concluded that the pronunciation of *the* with a close front vowel, and with possible lengthening is a signal to the other participants in a conversation that a speaker is experiencing a problem.

More generally, lengthening of a sound to indicate hesitation is most commonly found in grammatical items, such as prepositions, articles, conjunctions, etc. As was said above, it is these items which most often occur before content word classes, such as nouns, where the speaker may be experiencing problems finding the appropriate item.

Example

The sonagram in Figure 2 is a short extract taken from a dialogue elicited using the map task scenario (Anderson *et al.*, 1991). In this scenario, two speakers are given fictitious maps. A path is marked on one of the maps and it is the task of the speaker with this map to instruct the other participant where the path runs. What neither participant knows is that there are small differences between the landmarks on each map.

Figure 2 Sonagram and phonetic transcription of the conversation extract ''right well the start is right at the bottom of page um'' spoken by a female speaker. Portions which could broadly be linked with hesitation are marked in gray. Pauses are marked with (P).

The extract shown in Figure 2 is at the beginning of the dialogue and contains examples of many of the types of disfluency that have been discussed in this article. A broad phonetic transcription of the words and other interactional aspects of the extract have been approximately aligned with the relevant parts of the signal. Those parts of the extract that broadly can be associated with hesitation have been marked in gray.

The portions marked in gray make clear the relative amount of disfluent speech that can occur in a short extract of conversation. The first two pauses are of the 'holding' type that Local and Kelly (1986) describe, i.e., the speaker begins the pause by finishing one word with a glottal stop and holds this glottal stop until the beginning of the next word. Interestingly, in the second case the release of final alveolar plosive of *start* is ejective because a glottal stop has been formed before the stop closure is released. The words *start* and *is* are both long. The monosyllable *start* is approximately 750 ms long. By comparison the seven syllable stretch *right at the bottom of the* takes only approximately 1000 ms.

Hesitation and Speech Recognition

From the point of view of the person writing a computer program that recognizes spoken language, the speaker should ideally speaker in fluent, grammatically correct and semantically coherent sentences. However, as we have seen, conversational reality looks very different. Speakers produce silent and filled pauses throughout their talk, they break off utterances, leaving behind incomplete sentence fragments. Commercial applications such as a flight information and reservation services must be able to cope with the normal, disfluent speaker. For this reason, disfluencies, such as hesitation, have attracted a good deal of attention from speech technologists over recent years (O'Shaugnessy, 1992; Shriberg, 1994, 2001).

Hesseling, Dirk Christiaan (1859–1941)

J Noordegraaf, Amsterdam, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Hesseling, a Dutch linguist and a true polyglot, counts as one of the fathers of modern creolistics. Born in Amsterdam, he enrolled in 1878 as a student of classical languages at the University of Leiden. In his student years he had the opportunity to visit Italy and Greece several times. In 1886 he defended a rather conventional doctoral thesis that dealt with an archeological subject and became a teacher of classical languages at the 'gymnasium' of the city of Delft. Accompanied by his young wife and two daughters, he spent a sabbatical in Paris in 1889, where he studied Modern Greek with Legrand and Psichari. There he became friends with the classical scholar Hubert Pernot (1870–1946), with whom he was to collaborate for many years. Following Hesseling's crucial turn towards the living languages, the year 1893 saw his appointment as a 'privaatdocent' (external unsalaried lecturer) in Modern Greek at Leiden University; in 1907 Hesseling was appointed to a special chair in that subject at the same university. As his courses were not compulsory, he always had a rather small number of students. Having retired in 1929, he died in Leiden in 1941.

Interested in the formation of the Greek *koine* and seeking to test his views on the development of modern Greek within the context of a general theory of linguistic change, Hesseling turned to the study of Afrikaans, the language of the Boers in South Africa, which is – in one way or another – a descendant of 17th-century colloquial Dutch. It was the first evidence of his interest in language contact and creole languages. Hesseling formulated the core of his approach to the origin of Afrikaans in an 1897 article and greatly elaborated his ideas on the subject in the book *Het Afrikaansch*, which was published in 1899 (2nd revised edition 1923) and is still regarded as the first truly scientific study of Afrikaans. He was of the opinion that Malay-Portuguese (Malaccan Creole Portuguese), the lingua franca in African ports, was the underlying cause for the curious and remarkably rapid grammatical transformation of the Dutch language at the Cape of Good Hope. As Ponelis (1999) points out, Hesseling placed emergent Afrikaans within the colonial Dutch contact situation. In his sociohistorical analysis of the 17th-century language contact situation at the Cape, he discounted the impact of either Koi or French and German on emergent Afrikaans. It was the creole Portuguese introduced by slaves that Hesseling considered to be the main factor in the development of Afrikaans from colloquial 17th-century Dutch.

Hesseling's views were favorably received by a number of linguists who elaborated them further. Objections against his hypothesis have been made by various South African scholars; D. B. Bosman (*Oor die ontstaan van Afrikaans*, 1923), for example, considered the change as a degeneration or corruption of Dutch as it was spoken by the numerous strangers of different nationalities, and partly assumes a spontaneous development. It was Marius Valkhoff who in 1966 brought Hesseling's work to the fore again and consequently provoked a fierce polemics.

Note that, Hesseling's involvement in the diachrony of early Afrikaans was partly stimulated by his passionate interest in the language politics of the emergent Afrikaans standard language. He was the first linguist of note who argued for the standardization of Afrikaans. His interest into language politics is also manifest in his writings on Dutch orthography. Hesseling was an fervent supporter of the simplification of the complicated Dutch spelling system, which was at the time mainly based on an antiquated version of written Dutch; he published a couple of excellent papers on this theme.

Having entered the field of creole studies by way of Afrikaans, Hesseling was to contribute to creolistics until the end of his life. In 1905 he published a monumental work on the Negerhollands of the Virgin Islands, which is a comprehensive historical study. As his bibliography (1939) shows, he also published

Hesseling's views were favorably received by a number of linguists who elaborated them further. Objections against his hypothesis have been made by various South African scholars; D. B. Bosman (*Oor die ontstaan van Afrikaans*, 1923), for example, considered the change as a degeneration or corruption of Dutch as it was spoken by the numerous strangers of different nationalities, and partly assumes a spontaneous development. It was Marius Valkhoff who in 1966 brought Hesseling's work to the fore again and consequently provoked a fierce polemics.

Note that, Hesseling's involvement in the diachrony of early Afrikaans was partly stimulated by his passionate interest in the language politics of the emergent Afrikaans standard language. He was the first linguist of note who argued for the standardization of Afrikaans. His interest into language politics is also manifest in his writings on Dutch orthography. Hesseling was an fervent supporter of the simplification of the complicated Dutch spelling system, which was at the time mainly based on an antiquated version of written Dutch; he published a couple of excellent papers on this theme.

Having entered the field of creole studies by way of Afrikaans, Hesseling was to contribute to creolistics until the end of his life. In 1905 he published a monumental work on the Negerhollands of the Virgin Islands, which is a comprehensive historical study. As his bibliography (1939) shows, he also published

on Papiamentu, on Canadian French, Ceylon-Dutch, and creolization in general.

In many respects, Hesseling can be seen as a follower of Hugo Schuchardt. They both held a Humboldtian conception of language, and both rejected Neogrammarian linguistic thinking. It appears that Hesseling shared Schuchardt's general approach to language and adopted various insights from him; in other respects he disagreed with the master of Graz. As the correspondence between Hesseling and Schuchardt reveals (cf. Gilbert, 1994), it was Hesseling who urged Schuchardt to publish the latter's now famous *Die Sprache der Saramakkaneger in Surinam* with the Royal Dutch Academy in Amsterdam in 1914. Other linguists he felt affinity with were Francisco Adolpho Coelho and Lucien Adam. At any rate, Hesseling's works constitute a fully fledged theory of creolization in its own right.

It is probably true to say that by writing in his native tongue and mostly on topics such as Afrikaans and Negerhollands, as distinguished and original a creolist as he was, Hesseling seriously limited his influence on modern creole research.

Heterosexism

Heterosexism, like many other isms, points to particular social constellations and belief systems that privilege one way of inhabiting social space over others. In the case of heterosexism, that constellation involves the presupposition of a sex-based, binary distinction between male and female, a presupposition that provides a central and essentializing organizational strategy for many, if not most, cultures and societies spanning both space and time. This presupposition establishes heterosexuality as normal and normative and grounds a second binary distinction between heterosexuality and homosexuality, a distinction in which nonheterosexual forms of activity, identity, and community are denigrated or penalized and heterosexuality is privileged. Heterosexism captures the political, institutional, and cultural expression of this privilege. Assuming a girl has, or would have, a boyfriend is heterosexist, as is asking a stranger about his wife.

Just like other forms of oppression and discrimination, heterosexism can be manifest in both blatant and somewhat more insidious forms. Blatant heterosexism is found in areas of social life in which nonheterosexual identities are constructed as inferior, deviant, or deficient. Blatant heterosexism can be seen, for instance, in laws that govern criminally liable sexual behavior or that regulate who can and cannot be legally married. More insidious forms of

on Papiamentu, on Canadian French, Ceylon-Dutch, and creolization in general.

In many respects, Hesseling can be seen as a follower of Hugo Schuchardt. They both held a Humboldtian conception of language, and both rejected Neogrammarian linguistic thinking. It appears that Hesseling shared Schuchardt's general approach to language and adopted various insights from him; in other respects he disagreed with the master of Graz. As the correspondence between Hesseling and Schuchardt reveals (cf. Gilbert, 1994), it was Hesseling who urged Schuchardt to publish the latter's now famous *Die Sprache der Saramakkaneger in Surinam* with the Royal Dutch Academy in Amsterdam in 1914. Other linguists he felt affinity with were Francisco Adolpho Coelho and Lucien Adam. At any rate, Hesseling's works constitute a fully fledged theory of creolization in its own right.

It is probably true to say that by writing in his native tongue and mostly on topics such as Afrikaans and Negerhollands, as distinguished and original a creolist as he was, Hesseling seriously limited his influence on modern creole research.

Heterosexism

Heterosexism, like many other isms, points to particular social constellations and belief systems that privilege one way of inhabiting social space over others. In the case of heterosexism, that constellation involves the presupposition of a sex-based, binary distinction between male and female, a presupposition that provides a central and essentializing organizational strategy for many, if not most, cultures and societies spanning both space and time. This presupposition establishes heterosexuality as normal and normative and grounds a second binary distinction between heterosexuality and homosexuality, a distinction in which nonheterosexual forms of activity, identity, and community are denigrated or penalized and heterosexuality is privileged. Heterosexism captures the political, institutional, and cultural expression of this privilege. Assuming a girl has, or would have, a boyfriend is heterosexist, as is asking a stranger about his wife.

Just like other forms of oppression and discrimination, heterosexism can be manifest in both blatant and somewhat more insidious forms. Blatant heterosexism is found in areas of social life in which nonheterosexual identities are constructed as inferior, deviant, or deficient. Blatant heterosexism can be seen, for instance, in laws that govern criminally liable sexual behavior or that regulate who can and cannot be legally married. More insidious forms of

heterosexism surface as a heterosexual bias through which nonheterosexual identities and communities are largely erased. Examples of this form of heterosexism are somewhat more difficult to specify, but include entitlement laws such as those governing inheritance, social services benefits and taxation, and cultural rituals such as school dances, 'family' picnics, and wedding receptions.

Heterosexism, Language, and Social Meaning

Given the seemingly nonlinguistic nature of heterosexism, in what ways is it useful to address the issue of heterosexism and language? This question recalls debates about sexism in language, which typically revolve around determining whether languages or speakers of languages bear the primary responsibility for creating and perpetuating sexism (or other isms). These debates are usually resolved through prescriptive interventions (such as guidelines on the use of gender-marked pronouns) and/or through a shift in focus away from language *per se* and toward language use. Critically, these debates highlight the potential for language and language variation to be part and parcel of sociocultural and political change.

Such debates also point to the linguistically constructed nature of social meaning. The fact that meaning is not fixed but rather emerges from ongoing social action means that it is impossible to predetermine what kinds of language use will be tied to social biases such as heterosexism or to predict what kind of linguistic patterns people with heterosexist or homophobic biases will exhibit. Language use that is interpreted as neutral by one person can be interpreted as sexist or heterosexist by another. Similarly, interactants can contest claims that their language use is biased. Despite these problems, the examination of heterosexism and language presents a number of benefits for the overall study of language. Refining social categories such as gender, which form the cornerstone of much research on language variation and change, constitutes one important benefit. Showing how language helps naturalize some versions of the social landscape over others presents another. Finally, the exploration of heterosexism and language illustrates how people resolve problems of adapting conventions of language use to changing social norms.

Heterosexism in Language: Kinship Terminology

As an example of how people can adapt linguistic conventions, some lesbians and gay men in the English-speaking world have reconfigured the English kinship system to help create new understandings of family relationships. Most kinship systems are centrally founded on heterosexual, procreative relationships and the (assumed) biogenetic ties that result. Although systems of kinship may differ in terms of how those biogenetic ties are conceived and ordered, most, if not all, encode some kind of gender binarism that at the very least locates a given individual (an 'ego') in terms of a web of relations organized according to gender distinctiveness. The English terms *mother/father*, *brother/sister,* and *aunt/uncle* are good examples of this binarism. English has a few gender-neutral kinship terms, for example, *cousin* or *spouse*, but in general the kinship system remains staunchly heterosexist even as family constellations have evolved to include a variety of groups of adults in myriad child-raising and nonchild-raising situations.

A look at the use of kinship terminology in some of these new family constellations reveals surprising patterns. For instance, work on kinship among gay men and lesbians in San Francisco, California, showed that gay men and lesbians who live in 'chosen' families (families consisting of close friends and romantic partners rather than kin) constitute those families in relation to their families of origin. Within such chosen families, traditional kinship terminology helps sustain nontraditional familial bonds. Thus, gay male and lesbian couples may reclaim spousal terms such 'wife' or 'husband' to refer to each other and in so doing disrupt the very gender binary traditionally encoded therein. Gay men and lesbians who use this terminology typically leave the gender specificity of the term intact (e.g., a lesbian will refer to her 'wife' and a gay man to his 'husband'), whereas homophobic discourses that use this terminology typically maintain the encoded binarism (e.g., deridingly asking a lesbian couple, "Who's the husband?"). Distinctions such as these illustrate the difficulties with trying to specify heterosexism within language itself. Even the blatantly heterosexist kinship system can be reinterpreted to capture nonheterosexist meanings.

Speakers may also use the available terminological system in novel ways. Thus, questions about whether someone is 'family' are sometimes used in the United States to covertly ask whether or not someone is queer. The 'auntie' relationship among U.S. drag queens captures a close intergenerational bond between an older (often retired) drag queen and a younger protégé, whereas the 'daddy/boy' relationship denotes a romantic relationship between an older and younger man. 'Daddy' relationships are also found in the leather community, where the 'daddy' is the dominant partner (male or female, young or old, 'top' or 'bottom'). These examples further illustrate the discursive flexibility available through language, even in seemingly closed systems like the kinship system.

Table 1 Female characters' use of the (ING) variable from six episodes of *Ellen*[a]

Character	*Character's sexual identity*	*Progressive verbs*	
		[ɪn]	*[ɪŋ]*
Ellen	Lesbian	62 (41%)	90 (59%)
Audrey	Nonlesbian	1 (10%)	9 (90%)
Paige	Nonlesbian	1 (6%)	16 (94%)
Laurie	Lesbian	13 (10%)	18 (90%)
Lois	Nonlesbian	0	8 (100%)
Random females (8)	Mixed (4 lesbian; 4 nonlesbian)	0	17 (100%)
Totals		77 (33%)	158 (67%)
	Lesbian	75 (41%)	108 (59%)
	Nonlesbian	2 (4%)	50 (96%)

[a]The difference between lesbian and nonlesbian characters in the use of this variable is significant at .01 (DF, 1).

Heterosexism and Language: Linguistic Variation

Many studies of language variation rely on quantitative analysis as a way of locating speakers (and their language use) in time and space. Although the social meaning of variation emerges *in situ* during face-to-face interaction, situating the social significance of that meaning typically requires a view of the data that goes beyond the strictly local. One such view occurs in the widespread popular assumption (or pseudo theory) that gay men sound more feminine than heterosexual men and lesbians more masculine than heterosexual women. Here, the power of an assumed, heterosexist gender binary is so strong that speakers use it to explain, justify, and order their perceptions of intragender variation in basically the same terms as they understand their perceptions of intragender variation.

Representations of Linguistic Variation in Popular Culture

Data from popular culture offers an excellent means of observing the extralocal process described earlier because popular culture often uses language as an especially powerful tool for presenting stereotypes about different kinds of people. A good example of language used in this way can be found in the television situation comedy *Ellen*, which aired on the ABC network in the United States from 1994–1998. Although this show had a strong following among gay men and lesbians from its start, the issue of homosexuality became front and center in 1997 when the main character openly acknowledged that she was lesbian. A number of different linguistic features showed variation that correlated with the sexual orientation of the characters on the show. So, for instance, the gay male characters on the show had higher average pitch values than did the heterosexual men, and the lesbians had lower average pitch values than the heterosexual women. This pattern mirrored the pattern for male and female characters more generally, with the men having lower average pitch than the women.

Similarly, characters showed differences in the realization of the progressive morpheme variable (ING). (ING) has two main variants in many varieties of English, a velar realization [ɪŋ] and an alveolar realization [ɪn]. Many studies of this variation have shown a correlation between the variant produced and gender, with the [ɪn] variant correlating with male gender and the [ɪŋ] variant correlating with female gender. The usage also correlates with other social factors (such as class, age and education level) and with situational changes (such as formality, politeness, and genre); however, these will not be of primary concern for this illustration.

In Tables 1 and 2, the characters have been divided first by gender (Table 1 shows all the female characters, and Table 2 shows all the male characters) and then by sexual orientation. When the variable /ɪŋ/ is compared for gender alone, there is a difference between the male and female characters. Although all characters produce more [ɪŋ] variants than [ɪn] variants, the female characters produce relatively more [ɪŋ] variants than the male characters (33% vs. 40%), a difference that is statistically significant ($p < .02$). The differences between male and female characters in the production of [ɪŋ] are mirrored by differences between lesbian and nonlesbian characters and by differences between gay and nongay characters. Although the various participants in this representation (writers, directors, actors, viewers) may or may not have perceived this pattern of language use as heterosexist, the fact that the same linguistic patterns that distinguished male and female characters also distinguished characters based on their sexual identities provides linguistic support for the foundation on which heterosexism is based, namely a naturalized, binary distinction between male and female. The

Table 2 Male characters' use of the (ING) variable from six episodes of *Ellen*[a]

Character	*Character's sexual identity*	*Progressive verbs*	
		[ɪn]	*[ɪŋ]*
Howard	Nongay	6 (55%)	5 (45%)
Peter	Gay	2 (15%)	11 (85%)
Spence	Nongay	8 (42%)	11 (58%)
Joe	Nongay	3 (75%)	1 (25%)
Random males (4)	Nongay	10 (50%)	10 (50%)
Random males (2)	Gay	4 (27%)	11 (73%)
Totals		33 (40%)	49 (60%)
	Gay	6 (21%)	22 (79%)
	Nongay	27 (50%)	27 (50%)

[a]The difference between gay and nongay characters in the use of this variable is significant at .04 (DF, 1).

degree to which the patterns found on *Ellen* resemble patterns from real-world lesbians and gay men is a matter in need of more research; however, much of the work that has been done on language and sexual identity has shown that gay and lesbian speakers make complicated use of the linguistic norms associated with both men and women. In addition, they also rely on norms that are specific to gay or lesbian identities and communities, once again highlighting the enormous flexibility afforded by linguistic variation.

Heterosexism is a general orientation to social life that often affects analysts as well as speakers, with the result being that many intragender variations are lost or ignored, especially when the focus turns to how 'women' or 'men' speak. A focus on the relationship of language and heterosexism calls attention to the importance of balancing similarities and differences within and across social groups, so that spurious generalizations are avoided and genuine patterns are identified. Such a focus also provides one specific way of organizing linguistic variation within a broader social and cultural matrix and in so doing helps mediate the production of social and linguistic meaning. Moreover, it offers a window into how speakers come to linguistic terms with changing social realities and cultural landscapes and ties the production of heterosexism to other oppressive discourses, such as racism, ableism, and sexism. There are many possible avenues for exploring heterosexism and language beyond those presented here. For instance, the discursive unfolding of heterosexism has been examined in contexts such as talk shows featuring lesbian and gay parents, college student slang, news accounts, and everyday conversation. Many disciplines outside linguistics have also seen considerable attention paid to the issue of heterosexism, among them psychology, communications, anthropology, sociology, political science, and cultural studies.

Highland East Cushitic Languages

G Hudson, Michigan State University, East Lansing, MI, USA

© 2006 Elsevier Ltd. All rights reserved.

Demography

Highland East Cushitic (HEC) languages are spoken by some five and a half million people in south-central Ethiopia, in an area bounded generally by the 5th and 9th degrees of north latitude and the 37th and 39th degrees of longitude.

There are five HEC languages, from north to south Hadiyya, Kambaata, Sidaama, Gedeo (formerly Darasa), and Burji (formerly sometimes Bambala). A dialect of Hadiyya (i.e., mutually intelligible with it) separately reported in the 1994 census is Marak'o (or Libido). Dialects of Kambaata also separately reported in the census are T'imbaaro and a closely related pair Alaba and K'abeena. (Letters followed by apostrophes represent glottalic ejective consonants.) Sidaama has distinct regional dialects, as do Gedeo and Burji, but these are not usually distinguished by name or otherwise in the literature. A group of Burji left Ethiopia around the turn of the century, and live in and about the northern Kenya town of Marsabit.

Table 1 shows the numbers of ethnic-group members and first-language speakers of the five languages and nine named dialects as reported by the 1994 Ethiopian Census (Office of Population and Housing Census Commission of Ethiopia, 1998, vol. 1; also see Hudson, 2003). The 1994 Census reported 4 241 804 HEC first-language speakers, which is 7.9% of the 1994 Ethiopian total population of 53 477 265. Sidaama, the most populous HEC language, was the fifth most populous Ethiopian language, after Amharic (17 372 913), Oromo (16 777 975), Tigrinya (3 224 875), and Somali (3 187 053). The Census (Summary Report, 1998) suggested a multiplier of 1.37 to estimate 2005 total Ethiopian population, which yields a 2005 HEC first-language-speaker total of over 5.8 million. In fact, although Hadiyya and Sidaama may have increased speakers in such proportion, less populous varieties may have decreased.

Notice in **Table 1** that Alaba, K'abeena, and especially Sidaama are reported to have more first-language speakers than ethnic-group members. For Sidaama, this is consistent with its large number of speakers and presumptive function as a lingua franca in its region. The reason for this result for Alaba and K'abeena is less apparent.

The HEC territory is part of a linguistically diverse region of the West Rift Valley highlands where converge three of the six subgroups of Afroasiatic (Hamito-Semitic) languages: Cushitic, Semitic, and Omotic (the other three are Egyptian, Berber, and Chadic). Most of the HEC peoples share with Semitic 'Gurage' and Omotic peoples of this region a unique agro-ecology based on cultivation of the 'false banana' tree *ensete adulis*.

Classification

The HEC languages are Afroasiatic languages of the Eastern branch of Cushitic. The majority of Cushitic languages, some 19, are spoken in Ethiopia. The most populous Eastern Cushitic languages are

Table 1 HEC ethnic-group members and first-language speakers

HEC dialect	*Ethnic-group members, 1994 census*	*First-language speakers, 1994 census*
1 Burji	46 552	35 731
2 Gedeo	639 879	637 082
3 Hadiyya	927 747	923 957
4 Marak'o	38 093	36 612
Total 3–4	965 840	960 569
5 Kambaata	499 631	487 654
6 Alaba	125 894	126 257
7 K'abeena	35 065	35 783
8 T'imbaaro	86 499	82 803
Total 5–8	747 089	732 497
9 Sidaama	1 842 444	1 876 329
Total 1–9	4 241 804	4 242 208

Figure 1 HEC language relationships.

Oromo and Somali. For an overview of Afroasiatic linguistics, see Hayward (2000). For a study of Cushitic grammatical characteristics, see Hetzron (1980), and for an overview of Cushitic classification, see Tosco (2000).

Figure 1 presents the tree-diagram of subgroupings within HEC, assuming mutual intelligibility within the Kambaata group. Burji is considerably divergent from the others, presumably reflecting its earlier separation from them. The general picture based on linguistic diversity, which is focused in southwest Ethiopia, is of south to north spread, with Burji the least moved and Hadiyya having diverged most recently from Kambaata. Oral traditions of these people often claim northern origins, but this is probably an influence of their Christian and/or Muslim faith.

Writing

The HEC languages were little written until the linguistic liberalization resulting after the Ethiopian revolution of 1974, which ended the unique official status of Amharic, and made Gedeo, Hadiyya, Kambaata, and Sidaama among the 15 languages promoted for literacy by the new government. Then the languages were written in the Amharic (Ethiopic) writing system. More recently, Ethiopian Cushitic languages have begun commonly to be written with the European-language alphabet. With further linguistic liberalization in the 1990s, Sidaama and Hadiyya, as the most populous languages of their areas, are now used, if limitedly, in primary education and local government, and in publications including newspapers, political writings, and fiction.

Typology

The HEC languages are typologically quite consistent as inflectional, suffixing, and head-final ('SOV'), and have closed syllables of limited types. A measure suggestive of diversity within HEC is percentages of cognates in a basic hundred-word list. Table 2 presents these figures for the five major HEC varieties, which range from 39% for Burji-Kambaata to 70% for Gedeo-Sidaama (Wedekind, 1990: 46). Mutual intelligibility between varieties is roughly expected by such figures from about 75–80% (see also Bender and Cooper, 1971).

Table 2 Percentage of cognates shared by five HEC varieties in a basic 100-word list

	Burji	*Gedeo*	*Sidaama*	*Kambaata*
Hadiyya	44	56	62	66
Kambaata	39	49	66	
Sidamo	47	70		
Gedeo	43			

Table 3 Ten basic words in five HEC varieties

Gloss	*Burji*	*Gedeo*	*Hadiyya*	*Kambaata*	*Sidaama*
bird	č'iid'aa	č'iʔa	č'iiʔ-iččo	č'iičču-ta	č'eeʔ-iččo
to bite	gama	gaʔma	gaʔmi	gaʔmu	gaʔma
bone	mič'a	miččʼo	mik'e	mik'a	mik'a
blood	č'eeǰi	mundee	t'iiga	k'egu	mundé
breast	ununa	unuuna	anuuna	anuuna	unuuna
to come	inta(j)a	daga	waari	waalu	daga
to die	re(j)a	re(ʔ)a	lehi	re(e)hu	rea
ear	d'aga	manša	mačč'e	mačč'a	mačč'a
five	umutta	onde	onto	onto	onte
foot/leg	luka	lekka	lokko	lokka-ta	lekka

A broad descriptive-comparative survey of the HEC languages can be found in Hudson (1976); additional comparative information focused on morphophonemics in Abebe *et al.* (1985); a study of subclassification and history in Hudson (1981); a Burji etymological dictionary in Sasse (1982); an HEC comparative dictionary in Hudson (1989); a comparison of Kambaata varieties in Crass (2001); and a survey of HEC morphology in Hudson (forthcoming). Analysis of Burji, Gedeo, and Sidaama texts is presented by Wedekind (1990) and of a Burji text by Kellner (2001). Some characteristic features of HEC grammar concerning phonology, verb and noun morphology, and syntax are discussed next.

Phonology

Typical HEC word structure, as well as information about other phonological characteristics, is suggested in Table 3, a selection of 10 basic words in the 5 languages. Words of Table 3 are written phonemically, but phonetic interpretation is straightforward. Characteristics that may be noted are typically open syllables, five-vowel system, contrastive vowel and consonant length, glottalic ejective consonants *t'*, *k'*,

Table 4 Epenthesis, assimilation, and metathesis in Gedeo past-tense verb formation

	Suffix of past tense	*af- 'get'*	*dar- 'tear' (vt)*	*daff- 'perspire'*
1 sg.	-enne	afenne	darenne	daffenne

3 sg.f.	-te	affe	darte	daffite
1 pl.	-nenne	a[ŋ]fenne	darrenne	daffinenne
2 pl.	-tine	affine	dartine	daffitine
3 pl.	-ne	a[ŋ]fe	darre	daffine

č' (rarely also *p'*), glottalic implosive *d'* (in Burji 'bird', 'ear'), phonemic glottal stop, glottal onset *ʔm* ('bite'; there are also *ʔn* and *ʔl*), and word-internal syllables closed by sonorant consonants or the onset of long-consonants. In Sidaama and Kambaata, there are cases of final-syllable stress contrast, apparently resulting from shortened long vowels (cf. Sidaama and Gedeo 'blood').

Regarding HEC subclassification (Figure 1), apparent in Table 3 is the divergence of Burji, with its lesser number of apparent shared cognates, and the validity of subgroups Hadiyya-Kambaata and Gedeo-Sidaama, within which are more apparent cognates.

Characteristic of HEC languages other than Burji are pervasive processes of *i*-epenthesis, consonant assimilation, and nasal metathesis that 'conspire' to assure allowed syllable contacts when stems and suffixes combine in verb formation. These processes are illustrated in Table 4, which shows Gedeo past-tense suffixes in combination with verb stems *af-* 'get', *dar-* 'tear', and *aff-* 'perspire', the first with progressive assimilation by its stem-final obstruent of *t* of *t*-initial suffixes, the second with progressive assimilation by its stem-final sonorant consonant of *n* of *n*-initial suffixes, and the third with *i*-epenthesis between its stem-final long consonant and the consonant-initial suffixes.

Verb Morphology

The Gedeo examples of Table 4 also exemplify the typical paradigm of HEC verb formation, in which a monosyllabic verb stem combines with suffixes whose initial part is cognate with those of a general Afroasiatic pattern (seen as subject-prefixes in Semitic and Berber): first singular with an initial vowel (Gedeo *-enne*), second singular, second plural and third singular feminine in *-t* (*-titto*, *-ti-ne*, and *-te*), and plurals in *-n* (*-n-enne, -ti-ne, -ne*). Sidaama adds to the paradigm gender agreement in first-person and second-person singular, with final *o* for masculine and *a* for feminine, e.g., *afummo* 'I-masc. got', *afumma* 'I-fem. got'.

Also typical of HEC, with cognates elsewhere in Cushitic, are regular verb derivatives for causative in *-is*, passive in *-am*, and reflexive in *-id'* and its reflexes. Some examples from Sidaama are *aǰa* 'decrease' (vi.), causative *aǰisa* (vt.); *k'ana* 'suck', causative *k'ansa* 'suckle', *fana* 'open', passive *fanama*; *duna* 'pour', passive *dunama* 'leak', *afa* 'get', reflexive *afir'a*, *hasa* 'seek', reflexive *hasir'a*. Sidaama *r'* (of *-ir'* < *-id'*) is distinct from plain *r* only as it glottalizes preceding consonants, e.g., *k'ʔna* 'suckle,' reflexive of *k'ana* 'suck'.

A peculiar lexical phenomenon of Ethiopian languages whether Cushitic, Semitic, or Omotic, but perhaps particularly common in HEC, is verb compounds formed by words peculiar to the idioms plus the verbs 'say' for intransitives and 'do' for transitives. Examples with 'say' are Burji *naač'i i-* 'smile', Gedeo *dapp'i hiiy-* 'be tight', 'be quiet', Hadiyya *heešš y-* 'stoop', Kambaata *abb y-* 'rise', and Sidaama *beebi y-* 'be quiet'.

Noun Morphology

HEC has a singular ('singulative') as well as plural suffix, the former basically *-č*, or *-iččo* after obstruents. Plural formations are various, sometimes involving internal change, which is perhaps a Cushitic or Afroasiatic characteristic. Table 5 presents representative examples for all five languages.

The languages generally mark nominatives (and/or definites) with *-i*, but case marking is complex, perhaps under change, and more research is needed on this and others aspects of HEC grammar. Nominative vs. accusative marking has sometimes been considered a postergative phenomenon, as a generalization of the 'ergative' or subject-of-transitive case.

Sidaama (and perhaps other HEC languages to a lesser extent) has a phenomenon of gender-exclusive vocabulary (Anbessa, 1987). By a taboo on words beginning with the first syllable of her father-in-law's name, a woman must circumlocute or substitute words fixed in women's language for this purpose.

Table 5 Representative HEC singulars and plurals

Burji	*Gedeo*	*Hadiyya*	*Kambaata*	*Sidaama*
gota (sg.), gotanno 'sheep'	dureessa (sg.), dureeyye 'rich ones'	gaamelakiččo, (sg.), gaamela 'camels'	aburču (sg.), aburrata 'roosters'	hoončo (sg.), hoonna 'juniper trees'
hiliččo (sg.), hilaano 'calves'	geerčo (sg.), geeʔre 'old men'	hamašiččo (sg.), hamašša 'snakes'	bezzeečču (sg.), bezzeebeezzaa 'stars'	ille (sg.), illubba 'eyes'
č'uuwe (sg.), č'uuweenna 'chickens'	reččo (sg.), reʔe 'goats'	kina (sg.), kinnewwa 'stones'	lokkata (sg.), lokaakkata 'feet, legs'	ibiččo (sg.), ibiibe 'lice'

Table 6 Two sentences in HEC languages

Gloss	*HEC language*	*Sentence*
'This cow is fat'	Hadiyya	tu saay dilba-tte *this.fem cow fat-be.fem*
	Kambaata	ku saʔo gaana *this.masc cow fat*
	Sidaama	tini saa lowo-te *this cow fat/big-be.fem*
	Gedeo	tinni saa-yy-iččo furda-tt'e *this.fem cow-nom-sing fat-be.fem*
	Burji	ku saay-i gabboo-na *this.masc cow-nom fat-be*
'I cut (past) meat with this knife'	Hadiyya	maar ka billawi-n mur-ummo *meat this.masc knife-with cut-I.past*
	Kambaata	maala ka-n billawi-n murr-oommi *meat this.masc-with knife-with cut-I.past*
	Sidaama	maala tenné seet'e-nni mur-umm-o *meat this.fem knife-with cut-I.past-masc*
	Gedeo	maala konne šiifi-nni kut-enne *meat this.masc knife-with cut-I.past*
	Burji	maala ta sore-čč-ina mur-anni *meat this.fem knife-with-focus cut-I.past*

For example, a woman whose father-in-law's name begins with *ma* would use the word *basara* 'meat' instead of the usual *maala*.

Syntax

HEC syntax may be best presented in brief as in Table 6, which compares in the five HEC languages two sentences, one copular and one with a transitive verb.

Hiligaynon

R D Zorc, Language Research Center, McNeil Technologies Inc., Hyattsville, MD, USA

© 2006 Elsevier Ltd. All rights reserved.

Hiligaynon is the fourth largest language of the Philippines, representing approximately 10% of the national population. Its seven million speakers are located throughout Negros Occidental, southeastern Panay, Guimaras Island, and in urban centers of Mindanao (Davao and Zamboanga) and of Palawan (Puerto Princesa). It is a major trade language of the Western Visayan region (e.g., Antique and Aklan). Ilonggo, its alternate name, originally specified the dialect of Iloilo. It has many dialects with minor variations from town to town. The most distinct are Capiznon (Capiz Province) and Kawayan (south of Bacolod City). It is a member of the Central Bisayan subgroup along with Waray, Masbateño, and Romblomanon. These are, in turn, members of the Bisayan group of Central Philippine languages, including Tagalog and Bikol (Zorc, 1977), all of which are ultimately descended from Proto-Austronesian.

Although legends and fabrications abound (see Scott, 1984), nothing is known historically prior to the Spanish. Alzina recorded that the Hiligaynons of Oton (Panay) traced their origin to Leyte (Kobak, 1969–70: 22), which correlates with the subgrouping.

The basic phonology of Hiligaynon consists of 16 consonants and 3 vowels; accent (stress) is contrastive. Native speakers educated in Spanish and English have an additional three consonants /f, j, ch/ and two vowels /e, o/. Accent (/á, í, ú/ with vowel length) occurs in an open penult. The vowel [o] is an allophone of /u/ in final syllables but is phonemic in loans. Accent predictably falls on a closed penult: *táytay* 'bridge.'

The glottal stop is written as a hyphen when it appears before another consonant: *bág-o* 'new,' *búg-at* 'heavy,' *gáb-i* 'evening.' It is ignored word-finally in most local publications; linguists have spelled it with *q* or an apostrophe. Accent, which is also not represented in the orthography, is critical in distinguishing words or derivations:

ámo 'boss' {Spanish}	*amó* 'thus, like that'
sá'og 'crawl'	*sa'óg* 'wear out by use'
bílin 'remain, stay'	*bilín* 'leftovers'
píkot 'mend'	*pikót* 'half-closed (eyes)'
lútu' 'to cook'	*lutú'* 'cooked'
túbo 'pipe' {Spanish}	*tubó* 'sugarcane'

Various morphophonemic changes apply in inflection and derivation:

Table 2 Hiligaynon Pronouns

Pronoun	*Topic*	*Oblique forms*		*Locative*
		preposed	*postposed*	
I	**akó**	**ákon**	**-ko / nákon**	**sa'ákon**
you [singular]	**ikáw / ka**	**ímo**	**-mo / nímo**	**sa'ímo**
he.she	**siyá**	**íya**	**níya**	**sa'íya**
we [+you / incl]	**kitá**	**áton**	**-ta /náton**	**sa'áton**
we [−you / excl]	**kamí**	**ámon**	**námon**	**sa'ámon**
you [plural]	**kamó**	**ínyo**	**nínyo**	**sa'ínyo**
they	**silá**	**íla**	**níla**	**sa'íla**

Intervocalic /d/ > [-r-]: *báyad* 'pay' > *bayáran* 'be paid'

With Spanish verbs, final /r/ changes to [-h-]: *probár* 'try' > *probahán* 'be tried.' Nasal final prefixes such as the distributive pang- yield nasal assimilation and consonant loss:

batí' 'hear' > *památi'* 'listen to,' *tíndog* 'stand' > *panindúgan* 'position,' *káhoy* 'wood' > *pangahóy* 'gather firewood'

Vowel loss is common with suffixation:

inóm 'drink' > *ímnon* 'be drunk,' *sunúd* 'follow' > *súndun* 'be followed'

Grammatical relations are shown by particles (*kag* 'and,' *na* 'now, already,' *mga* plural, *man* 'also, too,' *lang* 'only') or affixes: prefixes (*pag-* temporal verb, *ka-* companion noun), infixes (*-in-* passive past), suffixes (*-un* direct passive, *-an* local passive), or circumfixes (*ka* – an abstract noun, *gina* – an local passive progressive).

Nominals are inflected for case: common nouns (marked by *ang* topic, *sing*indefinite oblique, s*ang* definite oblique, *sa* locative) or personal names *(si* topic, *ni* oblique, *kay* locative; plural: *sanday* topic, *nanday* oblique, *kanday* locative). Demonstratives orient to person, locus, time, or anaphora. They have existential and verbal inflections.

Verbs are inflected for four voices (active, passive, instrumental, local), four tenses (past, progressive, contingent, future), three aspects (punctual, durative, distributive), and three moods (factual, command, potential).

Unmarked word order is V-S-O (verb-subject-object); because nominal constituents are case marked, word order can be free. Initial position by any nonverb usually serves to highlight or contrast.

(1) kahápon si Hwaníng nag'abút
yesterday TOP Johnny past active-arrive
'It was yesterday that Johnny arrived'

Two other markers are: *nga* (*-ng* after vowels), a ligature uniting nouns with other constituents and ka after numerals.

(2) matahúm nga babáyi
pretty LINK woman
'a pretty lady'

(3) ma'áyo-ng ága
ADJ-good-LINK morning
'good morning'

(4) duhá ka simána
two NUM week
'two weeks'

There are three negatives: *ayáw* 'don't!' IMPERATIVE, *walá'* + TOPIC or *waláy* + OBJ 'none' EXISTENTIAL, 'did

Table 3 Hiligaynon deictics

	Near me	*Near you*	*Far away*
Topic	**iní**	**iná'**	**ató**

Hill, Archibald A. (1902–1992)

S I Sara, Georgetown University, Washington, D.C., USA

© 2006 Elsevier Ltd. All rights reserved.

Archibald Anderson Hill was born on July 5, 1902, in New York City. After the death of his father in 1908, he moved to California with his mother. He attended Pomona College and received his A.B. in 1923. He then went to Stanford University where he received his A.M. in 1924, and Yale University where he was awarded a Ph.D. in 1927. All these degrees were with a major in English. His interests extended into historical and structural linguistics, or neo-Bloomfieldian, as they were then called. He was the secretary-treasurer of the Linguistic Society of America from 1950 to 1968, and its president in 1969. He taught at the University of Michigan for four years, from 1926 to 1930, and at the University of Virginia from 1930 to 1952. In 1952, he joined Georgetown University as Vice-Director of the then Institute of Languages and Linguistics. From there he moved in 1955 to the University of Texas, where he taught until his retirement in 1972. He died in 1992.

His publications span the period from 1931–1975, beyond his retirement. They range in topics from literary and pedagogical to applied and theoretical linguistics (Jazayery *et al.*, 1978: 19–32). His career spanned the phenomenal growth and development in linguistics in America. He came into his own at the peak of the structural dominance in the field of linguistics in the 1950s, where the theory found its fuller articulation in books like *Methods in structural linguistics* (Harris, 1951) and *A course in modern linguistics* (Hockett, 1958), among others. His contribution was not so much theoretical as practical, and the best representative of his linguistic work is his *Introduction to linguistic structures: from sound*

not' PAST or 'doesn't' PRESENT, and *díli'* 'will not' FUTURE or PREDICATIVE 'is not so'; a fourth, *bukún,* negates nouns and adjectives in some dialect areas.

Hill, Archibald A. (1902–1992)

S I Sara, Georgetown University, Washington, D.C., USA

© 2006 Elsevier Ltd. All rights reserved.

Archibald Anderson Hill was born on July 5, 1902, in New York City. After the death of his father in 1908, he moved to California with his mother. He attended Pomona College and received his A.B. in 1923. He then went to Stanford University where he received his A.M. in 1924, and Yale University where he was awarded a Ph.D. in 1927. All these degrees were with a major in English. His interests extended into historical and structural linguistics, or neo-Bloomfieldian, as they were then called. He was the secretary-treasurer of the Linguistic Society of America from 1950 to 1968, and its president in 1969. He taught at the University of Michigan for four years, from 1926 to 1930, and at the University of Virginia from 1930 to 1952. In 1952, he joined Georgetown University as Vice-Director of the then Institute of Languages and Linguistics. From there he moved in 1955 to the University of Texas, where he taught until his retirement in 1972. He died in 1992.

His publications span the period from 1931–1975, beyond his retirement. They range in topics from literary and pedagogical to applied and theoretical linguistics (Jazayery *et al.*, 1978: 19–32). His career spanned the phenomenal growth and development in linguistics in America. He came into his own at the peak of the structural dominance in the field of linguistics in the 1950s, where the theory found its fuller articulation in books like *Methods in structural linguistics* (Harris, 1951) and *A course in modern linguistics* (Hockett, 1958), among others. His contribution was not so much theoretical as practical, and the best representative of his linguistic work is his *Introduction to linguistic structures: from sound*

to sentence in English (Hill, 1958). It is here where one finds structuralism in action in a real language at all its levels, from phonetics to syntax, but not semantics, true to the claims of the theory.

It is within such a thorough application of the theory that one senses the rigor of structuralism. If one were to take a sample from this book as representative of the applications of the distributional method to discovering the essence of language, then chapter six on phonotactics is representative of such a method at its best, and it is a gem of a treatise on this abstruse topic for the beginner. All the chapters faithfully applied the structuralist methodology of distribution.

Just as structuralism was coming into its own, the winds of change were blowing across the linguistic landscape, and Chomsky's view of linguistics as expressed in his book *Syntactic structures* (1957) was getting a hearing and gaining ground among linguists. The publication of Hill (1958) might have been the last triumphalist call of the theory, as the Generative School was to supplant and supersede it within the decade across the linguistic landscape.

Archibald Hill holds the esteem of many colleagues in the fields of his interest. A 4-volume Festschrift (Jazayery *et al.*, 1976–1979) was dedicated to him on the occasion of his retirement and includes: (1) general and theoretical linguistics; (2) descriptive linguistics; (3) historical and comparative linguistics; and (4) linguistics and literature/sociolinguistics and applied linguistics. More than 150 linguists wrote the Festschrift, and it was a great tribute to a colleague.

Hill, Jane H. (b. 1939)

S O'Neill, University of Oklahoma, Norman, OK, USA

© 2006 Elsevier Ltd. All rights reserved.

Jane Hassler Hill was born in Berkeley, California on October 27, 1939. After taking her first course in linguistic anthropology at Reed College, Hill's fate as a scholar was sealed. Stirring a lifelong passion for language, Hill later continued her studies at UC Berkeley, where she completed a B.A. in anthropology in 1960, winning the prestigious departmental prize on graduation. For her graduate training, Hill traveled to UCLA, where she studied with William Bright and Harry Hoijer (*see* **Hoijer, Harry (1904–1976)**), two respected linguists in the Americanist tradition. There she completed an M.A. in linguistics in 1962, followed by a Ph.D. in anthropology in 1966. Hill is best known for her cutting-edge research in linguistic anthropology, encompassing everything from language contact and prehistory to worldview, racism, and language obsolescence. Hill is also a respected descriptive linguist.

Over the course of her career, Hill has contributed widely to Uto-Aztecan linguistics, starting with her dissertation on the Cupeño language of southern California. Following in the tradition pioneered by Franz Boas (*see* **Boas, Franz (1858–1942)**) and Edward Sapir (*see* **Sapir, Edward (1884–1939)**), Hill's work with several elderly Cupeño speakers led to the first definitive grammar of this virtually undocumented language, a study she followed with a series of articles on stress, lexicalization, clause structure, and verb classes. Decades before, one of Alfred Louis Kroeber's (*see* **Kroeber, Alfred Louis (1876–1960)**) students, Paul-Louis Fay, had conducted preliminary fieldwork on Cupeño, allowing Hill to compare Fay's notes with her own, and leading to a lifelong interest in language obsolescence. Hill has also published on issues of prehistory, contact, honorifics, and color terminology in the Uto-Aztecan language family.

Hill's longstanding interest in contact and attrition culminated with the publication of *Speaking Mexicano* in 1986, a work she coauthored with her husband, Kenneth Hill. Set in the Malinche Volcano

Following in the tradition pioneered by Franz Boas (*see* **Boas, Franz (1858–1942)**) and Edward Sapir (*see* **Sapir, Edward (1884–1939)**), Hill's work with several elderly Cupeño speakers led to the first definitive grammar of this virtually undocumented language, a study she followed with a series of articles on stress, lexicalization, clause structure, and verb classes. Decades before, one of Alfred Louis Kroeber's (*see* **Kroeber, Alfred Louis (1876–1960)**) students, Paul-Louis Fay, had conducted preliminary fieldwork on Cupeño, allowing Hill to compare Fay's notes with her own, and leading to a lifelong interest in language obsolescence. Hill has also published on issues of prehistory, contact, honorifics, and color terminology in the Uto-Aztecan language family.

Hill's longstanding interest in contact and attrition culminated with the publication of *Speaking Mexicano* in 1986, a work she coauthored with her husband, Kenneth Hill. Set in the Malinche Volcano

region of central Mexico, among Mexicano speakers, a language that descends from classical Nahuatl, the book focuses on the structural effects of contact with Spanish. Over the centuries, Mexicano absorbed a number of features from Spanish, including nouns, verb roots, grammatical affixes, and syntactic templates. Though many Mexicano speakers are bilingual, the community as a whole has opted not to shift to Spanish across-the-board, owing to a pervasive ideology that attributes distance to Spanish and intimacy to Mexicano. Instead, the speakers of Mexicano have collapsed the opposition between the two languages in many settings, a situation that Hill and Hill describe as 'syncretism' rather than mere mixing. Once juxtaposed, speakers can either highlight or suppress the ideological overtones of the two speech forms, claiming the power, for instance, associated with Spanish or, alternatively, creating a subtle parody of the Spanish-speaking world. Ironically, a new ideology of purism, which places a strong preference on classical Nahuatl, now threatens what survives of the language today, with its strong Spanish influence.

Jane Hill has earned a reputation as one of the most distinguished scholars currently working in the tradition of linguistic anthropology. After a stint at Wayne State University, Hill accepted a position at the University of Arizona in 1983, where she currently holds the title of Regent's Professor. Hill also served a term as President of the American Anthropological Association in 1998–1999. In 2004, Hill was awarded the prestigious Viking Fund Medal, in recognition of her outstanding record of service and scholarly research in linguistic anthropology.

The Indo-Europeans came to India from the northwest about 4000 years ago. In India they called themselves *Arya,* 'noble honorable,' and called their country *Aryavarta,* 'abode of the noble.' Because of this ancient reference, today their language is known as *Indo-Aryan*. In regard to its structure and its continuity, Indo-Aryan can be divided into three periods: Old Indo-Aryan, Middle Indo-Aryan, and Modern Indo-Aryan.

Old Indo-Aryan is mostly represented by Sanskrit, which includes both Vedic and Classical Sanskrit. Middle Indo-Aryan is represented by three successive stages of development: Pali, Prakrit, and Apabhransha. Pali is the language of the canonical writings of the Theravada school of Buddhism. The various dialects recorded in the inscriptions of Ashoka (c. 250 B.C.) and other early inscriptions also belong to this first period. Prakrit, found mainly in drama and in the religious writings of the Jains, represents the second stage of development. Apabhransha, though known from texts of the 10th century A.D., was undoubtedly formed prior to this date. It represents the final stage of Middle Indo-Aryan. Hindi and modern Indo-Aryan languages, such as Assamese, Bengali, Gujarati, Kashmiri, Marathi, Nepali, Oriya, Panjabi, Sindhi, Sinhalese, and others, can be dated to about the end of the 10th century A.D. From then on, their development shows a gradual transformation into their present form.

As an Indo-Aryan language, Hindi is a branch of the Indo-European family of languages, and thus is a distant cousin of English, French, Greek, Russian, Spanish, and other Indo-European languages. The name 'Hindi' is a Persian word referring to the people who lived in the Sindhu river area. Later the word was used as a name for the language spoken around Delhi. This language has been called by other names, such as Hindavi, Hindui, and Hindustani. Hindi and Urdu are variants of the same language, which, in its common spoken form, used to be called Hindustani. Hindi is written in the Devanagari script, derived from one of the scripts used to write Sanskrit, while Urdu is written in a modified version of the Persian script, itself derived from the Arabic script. Along with Urdu, Hindi has been the dominant language of modern India and has had an impact on other Aryan and non-Aryan languages spoken in the country. Today it is spoken in most of India. In terms of total number of speakers, it ranks third in the world after Chinese and English. The percentage of the population of India that speaks Hindi is growing, and ranges upwards from 45%. Large language communities outside of India, including Nepal, Pakistan, Singapore, Malaysia, Burma, Mauritius, Trinidad, Guyana, and several countries in eastern and southern Africa also speak Hindi. Furthermore, Hindi is taught at many universities in the United States, Russia, Britain, and the Near East, as well as in other parts of Asia. Today Hindi is a symbol of Indian unity and nationality. It is the national language of India and the official state language of Bihar, Delhi, Haryana, Himachal Pradesh, Madhya Pradesh, Rajasthan, and Uttar Pradesh. Since Hindi has the largest number of speakers of any language in India, it is the medium of a great number of political, social, and cultural activities. Consequently, the economic and political influence of Hindi in India cannot be overlooked.

There are regional differences in Hindi, affected by the other languages that people speak. Within each regional variety of Hindi, there is considerable variation in speech according to the education and social standing of the speakers. This creates social dialects. Naturally, educated speech has more prestige and is thus embraced by government agencies, learned professions, political parties, the media, and institutions that attempt to communicate beyond their regional boundaries. It is this educated Hindi that has acquired the status of standard Hindi.

Underlying all these varieties, however, is a nucleus or common core shared by all speakers of Hindi. Unlike the other major modern Indo-Aryan and Dravidian languages of India, Hindi is not exclusively associated with any one region or province. Although it is the home language of a relatively small number of speakers (in Haryana, western Uttar Pradesh, northeastern Madhya Pradesh, and portions of eastern Rajasthan), Hindi in its various forms is a spoken and written language of practically all of northern India. It is also the most commonly understood Aryan language in the Dravidian south. Associated with all the different varieties of Hindi are the forms of formal and informal Hindi. The language used when giving instructions to a construction worker varies from the language used when discussing politics or poetry. Typically, the switch involves utilizing a particular set of lexical items habitually used for handling the topic in question. This tendency has produced informal Hindi, the language of everyday speech, which includes instructions to servants, waiters, workmen, clerks, etc., and formal Hindi, the language of films, newspapers, news magazines,

education, and literature. Formal Hindi is often marked by an abundance of words borrowed from Sanskrit. When the majority of borrowing is from Persian and Arabic sources instead of from Sanskrit, the language becomes formal Urdu.

Informal Hindi is usually used in speaking to children, and thus is acquired by children as their mother tongue. Children are often exposed to formal Hindi through their parents, but the actual learning of this variety is accomplished through formal education. In areas where the native language is different from Hindi, most speakers acquire Hindi through formal education. As stated earlier, Hindi spoken in these areas bears the influence of the native language, including elements from the native lexicon and phonology.

The sound systems of formal and informal Hindi constitute a single phonological system shared by both varieties; there are only a few phonemes and phonological rules found exclusively in formal or in informal Hindi. Like any language, the lexicon of Hindi consists of native words that have organically evolved from an earlier Indo-Aryan form and non-native words that have been borrowed from other languages. Sanskrit has been the primary source for borrowing in Hindi. After Sanskrit come Persian, Arabic, English, Turkish, and Portuguese borrowings, in that order. There are also a number of Dravidian words in Hindi, but most of them have come through Sanskrit. Hindi has also borrowed words from other modern Indo-Aryan languages, such as Bengali, Gujarati, Marathi, and Punjabi. As a result of these borrowings, the Hindi sound system has a large number of consonants and vowels, as shown in Table 1.

Like many Indo-European languages, Hindi has parts of speeches such as noun and pronoun, verb, adjective, adverb, postposition, and conjunction. Hindi nouns have two genders, masculine and feminine. Though these categories are largely conventional and do not necessarily correspond to natural gender, there is some element of semantic consistency for many nouns and their gender, which depend on sex, size, shape, and degree of abstraction. However, many gender affiliations remain arbitrary. The masculine gender nouns are associated with two different sets of stems and inflections and thus fall into two classes, *ā-stem*, such as gʰoɽā} 'horse,' and

non–ā-stem nouns, such as nāg 'snake.' The feminine gender nouns, likewise, are associated with two different sets of stems and inflections and thus form two classes: feminine *i-stem* nouns such as nānī 'maternal grandmother,' and *non-i-stem* nouns, such as bahū 'bride.' Hindi nouns also occur in various cases represented by two inflected forms of nouns: a *direct form*, which represents the function of a subject or a direct object and an *oblique form* with its postposition, which represents all other syntactic functions or cases. It is actually the postposition that indicates the particular case. An oblique form of a noun with the postposition kō also functions as a direct or indirect object (accusative or dative). When a transitive verb occurs in the *perfective*, the special postposition nē occurs directly after the subject, causing it to appear in its oblique form. This subject with nē is said to be in *ergative* case. In *ergative* constructions the verb agrees in number and gender with its direct object if this occurs in its direct form, that is, without any postposition; otherwise the verb, occurring in the masculine singular form, agrees with neither the subject nor the object. The non-ergative types of sentences in Hindi are the usual nominative-accusative type, in which the verb agrees with the subject in number and gender.

Hindi verbs are associated with the categories of *tense* (present, past, and future), *aspect,* (imperfective, perfective, and continuous), and *mood* (indicative, subjunctive, and imperative). These categories encode grammatical aspects of meaning, some quite specific and some relatively vague or generic.

In Hindi, in addition to *derivation*, by which new words are formed from existing words through affixation, for example, namak 'salt,' namkīn 'salty,' new words are also formed from existing words by processes known as *compounding*, for example, lāl pagaṛī 'red turban: a policeman,' and *reduplication*. To express the ideas of *continuance distribution*, *variety*, *exclusion*, or *emphasis*, words are often completely or partially reduplicated in Hindi, for example, bah-bah kar 'floating floating down: repeatedly floating,' g^{h}ar-g^{h}ar 'house-house: each house,' dēš-dēš 'country-country: various countries,' garam-garam 'hot-hot: real hot,' and badām-badām 'almonds-almonds: only almonds.'

As it can be seen from the following examples, Hindi is an SOV (Subject-Object-Verb) language and sentences in Hindi show a threefold agreement involving the inflectional categories of number, gender, person, and case. These agreements are (a) between a modifier (adjective, adjective participle, and genitive attributive) and the noun it modifies, for example, baṛā g^{h}ōṛā 'the big horse,' baṛē g^{h}ōṛē 'the big horses,' baṛī g^{h}ōṛī 'the big mare'; (b) between a predicative adjective and its subject, for example, (g^{h}ōṛā baṛā hæ 'the horse is big,' g^{h}ōṛē baṛe hæ̃) 'the horses are big,' g^{h}ōṛī baṛī hæ 'the mare is big'; and (c) between a finite or main verb with its subject or object noun or pronoun, for example, mē nē g^{h}ōṛā xarīdā 'I-ergative hors-masculine bought-masculine: I bought a horse,' mẽ nē g^{h}ōṛī xarīdī 'I-ergative mare-feminine bought-feminine: I bought a mare,' mē dōṛā 'I-masculine ran masculine', tum dōṛē 'you-masculine ran masculine,' tum dōṛī 'you-feminine anemone.'

Hindu Views on Language

J J Lipner, University of Cambridge, Cambridge, UK

© 2006 Elsevier Ltd. All rights reserved.

From earliest times to the present day, Hinduism, considered as a religious rather than as a cultural phenomenon, has been based on the power and efficacy of words, and the 'saving knowledge' that brings about the ultimate welfare of the human being has traditionally been transmitted normatively by the spoken rather than the written word. In the Brahminic Hinduism that has in some sense regulated the lives of the majority of religious Hindus down the ages, the repository of saving knowledge has been the Vedas, which took over a millennium – from about 1200 B.C.E. to about the 2nd century C.E. – to assume their present form. The Vedas are regarded as *śruti*, or 'hearing': the hearing, that is, in the mind's ear by primeval sages in mythic time of a precise sequence of a large body of utterances comprising hymns, descriptions of rituals, explanatory and didactic stories, and expressions of religious teaching and experience. The language of the Vedas is a form of Sanskrit, and for traditional, orthodox Hinduism the Sanskrit of the Vedas has always had a mystique of its own, an inner potency that can be controlled and applied in certain circumstances for various ends.

Even in the present day, there is a residual deference in most Hindu minds toward the use of Sanskrit. This derives from the role Sanskrit played in Vedic religion, which in its early stages revolved around the Sanskritic utterance in the proper performance of the solemn sacrificial ritual and later involved the muttered or intoned use of Sanskrit as a meditative aid. The idea was that if ritual Sanskritic speech was implemented correctly, it brought about or disposed one to attain certain worldly or transcendent 'fruits', not excluding final liberation itself. This idea gave rise to the tradition of transmitting the *śruti* in word-perfect form, from generation to generation, in numerous schools of Vedic recitation and study. Thus the Sanskrit of the Vedas was not only sacred speech *par excellence* but also the model of all language, and in Hindu tradition, philosophical issues that later hinged on the nature of the Sanskritic language in the context of *śruti* have either no counterpart or only derivative relevance in the use of Sanskrit outside the *śruti*, or in the vernaculars.

In the earliest portion of the Vedic scriptures, consisting of hymns, perhaps the most important word for sacred speech is *vāc*. The Vedic understanding of *vāc* is implicit in verses such as the following: "By sacrifice [the priests] walked the track of Speech [*vāc*]. They found her entered within the sages. Having fetched her, they distribute her manifoldly. Seven celebrants chant her together" (*Ṛg Veda* 10.71.3). Here *vāc* is likened to a cow in whose track priests and sages walk. Thus in essence and origin, *vāc* is not an artifact, a human construct; she is discovered and then used in various ways for human well-being. Other texts imply that *vāc* exists essentially as an inexhaustible and unmanifest reservoir, like a river dammed up and unflowing, which then streams forth, via various promulgators, its power and purity intact, in the form of the Vedic syllables (see Killingley, 1986). It is through the sacrificial ritual (and later on in other ways) that humans benefit from *vāc* in manifest form. It is from this original conception of sacred speech that key philosophical views about the nature of language derived in Hindu tradition, often with the help of vigorous debate with the Buddhists and Jains, both of which denied the inherent power and validity of the Vedas. Indeed, it is this view that *vāc* is essentially unmanifest, becoming manifest only partially in syllables and sounds (and ideally in the Vedas), that enabled modern Hindu thinkers and activists in touch with their ancestral faith, like M. K. Gandhi (the Mahatma), to argue that human truth is only partial and that it should not be absolutized in any form. This goes some way toward explaining so-called Hindu doctrinal tolerance (note that Gandhi's incomplete autobiography was entitled *The story of my* ***experiments*** *with truth*; emphasis added).

In later Vedic texts (from at least the time of the early Upanishads, circa 8th century B.C.E.), the word *par excellence* that encapsulates and symbolizes the essence of the Vedas is *Oṃ*. A whole Upanishad – the short Māṇḍukya – is devoted to exploring the different levels of spiritual experience encapsulated by this syllable. Subsequently, various thinkers, largely but not exclusively Vedāntins, beginning with Gauḍapāda (circa 6th century C.E.), philosophize on the theological meaning of *Oṃ*. Thus the Vedāntin Rāmānuja (11th–12th century C.E.) augments his view that there is a structural correspondence between Vedic language and reality, including ultimate reality, by an analysis of the implications of *Oṃ*. According to this view, which is developed in the context of Rāmānuja's opposition to strict monism, language in its normative form, that is, Sanskrit as the language of the Vedas, cannot be interpreted to reveal an undifferentiated Brahman or Absolute. This is because there is a structural correspondence between Vedic Sanskrit (intrinsically differentiated as it is by way of inflected words, syntax, and other grammatical forms) and its ultimate referent

Brahman, on which the whole Vedic corpus converges semantically.

The conclusion is that Brahman is also differentiated internally – as the possessor of various attributes and modes of being – as well as from finite being. Implied here is a particular theory of denotation, viz., that (Vedic) substantives signifying material things (e.g., *gau*), have, besides their explicit empirical referents ('cow'), also an implied, metaempirical referent that only the eyes of faith can perceive, namely, Brahman the ultimate being who gives existence and intelligibility to all finite being (see Lipner, 1986). In contrast, the monists, drawing their inspiration from Śaṃkara, the great theologian who established the monist tradition around the 8th century C.E., argued that the ultimate import of scriptural language is an undifferentiated Brahman, intrinsically without distinction and existing ultimately as the only reality. Part of Rāmānuja's argument consists of analyzing *Oṃ* as the (somewhat mystical) consummation of the Vedas and denotative, as such, of their ultimate referent, Brahman. Even today, *Oṃ* is the epitome of sacred sound for most upper-caste Hindus.

Though the language of the Vedas was a subject of intense systematic concern – phonetically, etymologically, grammatically, and exegetically – from the beginning of the first millennium B.C.E., this concern was not philosophical in any strict sense of the term. Sustained philosophical attention to language first appears in the Mīmāṃsā Sūtras, attributed to Jaimini, in about the beginning of the common era. Jaimini contends, to some extent by implication, that those words of the Veda that denote (material) substantival entities (e.g., *gau* 'cow', *aśva* 'horse') have a natural (*autpattika*) and eternal (*nitya*) connection, not directly with the individual objects they denote, but with a sort of concrete-universal (*ākṛti*) of the individuals denoted, and that it is through its *ākṛti* that an object is instantiated.

This view of the natural and eternal relationship of (Vedic) naming-words to objects, to which the Vedāntins also generally subscribed, was directly challenged in due course by the Naiyāyikas, or logicians. The logicians argued that the relationship between words and their referents (*śabdārthasambandha*) is the result of original divine mandate passed on to humans in primordial time, and as such person dependent (*pauruṣeya*) rather than 'impersonal' or intrinsic (*apauruṣeya*), as in the Mīmāṃsā view (see Ganeri, 1999: 31–38). The debate about the *apauruṣeya* or *pauruṣeya* nature of Vedic speech was a central one in the history of Hindu philosophical inquiry and made verbal testimony in larger context – as a potential source of true cognition or belief – a subject of increasing philosophical importance (Ganeri, 1999). Indeed, the Indian debate about the power of Vedic words to signify has interesting correlations with some modern Western discussions about language as an innate human capacity.

Jaimini also contended that the unit of referential meaning – of epistemic judgment – is the sentence (*vākya*), a view with which most Hindu philosophers of language agreed. There was disagreement, however, concerning the basic units, the so-called building blocks, of meaning. Were these semantic units the syllable or word, or sentences, or language taken as a whole? All these positions found support among traditional Hindu thinkers. It seems that the ancient etymologist Yāska (perhaps 6th or 5th century B.C.E.) was something of an atomist in this respect: "To Yāska a term, singular or general, is simply *equipped* with a meaning .... The meaning is embedded in it, hence is objective and can be grasped intersubjectively .... I am inclined to conclude that Yāska considers syllables and single sounds to be meaningful units" (Kahrs, 1998: 27, 38). However, according to the logician Gadādhara (17th century), "the meaning of a word is explained in terms of its contribution to sentence meanings. The account lies between extreme atomism, exemplified in the Indian literature by the [ritualist] Bhāṭṭa school, and Bhartṛhari's [see below] 'Quinian' semantic holism" (Ganeri, 1999: 31).

Though the Vedāntins agreed with the Mīmāṃsā ritualists about the 'natural' (*autpattika*), eternal (*nitya*), and non-person-dependent (*apauruṣeya*) character of Vedic text, they argued that Vedic language is basically fact assertive – *yathābhūtavādi*: it 'states what is the case'. In this their stance was of a piece with the Hindu philosophical tradition about the nature of language as a whole, which has always tended to be realist, or favor a "direct referential" approach to meaning (Ganeri, 1999: 3). It was only in this way that the Vedāntins could derive information from scripture about the existence and nature of the supreme metaempirical reality, Brahman, to attain which was the goal of human existence. For the theologically agnostic ritualists, however, human fulfillment was bound up not in the attainment of some ultimate Being but in the proper performance of the sacrificial ritual and the various kinds of *phala* or fruit this engendered. This is why, for the ritualists, Vedic language was essentially injunctive (*kāryārtha*), concerned with how the ritual was to be performed. A modern Western counterpart of this debate is that between the so-called cognitivists and noncognitivists or expressivists about the nature of religious language.

But ritualist and Vedāntin alike opposed the *sphoṭa* theory of the Grammarians (for whom the philosophy of grammar was of particular importance). A leading light in the articulation of this view was Bhartṛhari

(6th–7th century C.E.), according to whom there is no cognition without some form of verbal expression. In fact, for Bhartṛhari the source of all being and intelligibility was a metaphysical reality, which may be described as a primordial 'Word' (*Śabda*), which has an inherent power (*śakti*) to burst forth (*sphuṭ*) into ontologically creative expression. The aim of his complex theory was to explain not only the production of being but also true and false cognition and final release by way of different forms of the *sphoṭa*, 'the word burst forth'. The ultimate form of the *sphoṭa* is Brahman, called *Śabdabrahman*, a view that can be derived from the Upanishads, e.g., *Bṛhadāraṇyaka Upanishad* 4.1.2.

A number of other schools and thinkers, more or less close to the Vedic pale, gave consideration to the nature of religious language, generally within the framework of the kinds of issues and views mentioned above. Thus in the many-streamed, ancient, and scripturally somewhat independent tradition of Tantra, which to some extent sought to coexist with Vedic authority and had a pervasive influence in Hinduism, the role of language is important.

Here the

> original Word, identical to the primal divine energy [*śakti*], is envisaged ... as phonic energy (*vākśakti*), eternal, indestructible, and all-pervading .... This word, this sound, is endowed with a creative force .... The word precedes the object, it brings it forth, it is the energy that upholds it, its innermost nature, that into which it will dissolve at the time of the cosmic resorption. The process of emanation ... appears generally as unfolding from an initial luminous vibration or sound (*nāda*), which is an extremely subtle state of pure phonic energy, which through a series of transformations and condensations will become less subtle, forming a concentrate or a drop (*bindu*) of sound-energy, from which, when it divides itself, worlds, humans, and language will come forth ... [In this process there is] the outward movement of emanation, converting itself into a movement of return to the source. (Padoux, 1990: 50–51)

Abhinavagupta (11th century), who was much influenced by ideas from Bhartṛhari (see above), is arguably the outstanding philosopher of the Tantric tradition.

The idea that the Vedic naming-word (*nāmaśabda*) has an inherent efficacious power has some affinity with a pervasive view that is current even today. This is the view popularized in the vernacular by poet-saints from the 15th century onward, the Sants. According to Sant teachings, the divine exists in the form of an eternal sound, *śabd, śabad*, or *nād* (<Sanskrit *śabda*, 'sound, word'; *nāda*, 'sound'), having an intrinsic salvific efficacy, which can be heard by advanced initiates and is also manifest in the poems of the Sants. This doctrine can be found in the Hindi poems of Kabīr, Sur Dās, and others, and among the Sikhs. Its affinity with the Vedic concept of the transcendent syllable is corroborated by the Sikhs' use of *ekoṅkār* (<Sanskrit *eka oṃkāra*, 'the one *oṃ* sound') as a name of God. However, there seems to be no noteworthy philosophical treatment of this aspect of Sant doctrine, nor did it generate a trend of systematic thought in the vernacular.

As we have seen, Hindu speculation about the nature of religious language has recurrently been concerned with metaphysical implications of *śabda* or 'Word' as in some sense creative. With the passage of time, this idea was translated into iconographic form as well as into various theories of aesthetics. A fine example of its iconographic rendering is the well-known representation of Śiva Naṭarāja or Śiva as Lord of the Dance of existence, in which Śiva is depicted as producing from the small two-faced drum held in his upper right hand the sound that creates, sustains, and destroys the world (see Coomaraswamy, 1971, especially chapter 6).

Modern Hindu thinkers who have considered the nature of language fall into two camps: those who have, for all practical purposes, severed intellectual links with their ancestral faith – by far the majority: these need not concern us further since there is nothing distinctively Hindu here – and those who have philosophized in the context of Hindu or wider Indian thought. Even here notable original thinkers have been directly concerned not so much with the philosophy of language as with metaphysical, epistemological, and soteriological issues, e.g., S. Radhakrishnan (1888–1975) and Aurobindo Ghose (1872–1950). However, from about the middle of the 20th century onward, there has been a growing trend, among both Indians and Westerners, not only to unearth, by way of critical exposition, the enormous conceptual wealth of traditional Hindu (and other Indian) inquiry into the nature of language, but also to incorporate into modern analytic discussion the philosophical implications of this inquiry. This is potentially an extremely important development in the comparative philosophy of language.

Hindustani

H Dua, Central Institute of Indian Languages, Mysore, India

Hindustani is a Central Indo-Aryan language based on Khari Boli (Khaṛi Boli). Its origin, development, and function reflect the dynamics of the sociolinguistic contact situation from which it emerged as a colloquial speech. It is inextricably linked with the emergence and standardization of Urdu and Hindi. The linguistic relationship among Hindustani, Urdu, and Hindi highlights the theoretical and empirical problems of linguistic analysis and description. It also reveals the politics of language conflict and identity in the complex sociopolitical and multilingual situation of India.

Origin and Development

Hindustani as a colloquial speech developed over almost seven centuries from 1100 to 1800. The Muslims conquered northern India from the 10th to the 13th centuries and settled down in the country, bringing with them their Persian language and culture. This mixing of cultures provided the contact situation for the emergence of Hindustani as a lingua franca. During this period, the literary language Apabhraṁśa seemed to be in a state of transition from Middle Indo-Aryan to the New Indo-Aryan stage. Some elements of early Hindustani appear in compositions of the saints of Nath Panth. However, the distinct form of the lingua franca Hindustani appears in the writings of Amir Khusro (1253–1325), who called it Hindwi. Chatterji (1960) argued that the term 'Hindustani' came to be used at the close of the 17th century. J.J. Ketelaer is said to have written the first European grammar of Hindustani in Dutch in 1715.

During the early stage of language contact, Hindustani showed a great deal of mixing of dialects. In particular, the western dialect group of northern India – Braj Bhasha, Bangaru (Haryanvi), and to some extent eastern Punjabi – formed the basis of the vernacular Hindustani. The Perso-Arabic words were also used by traders, religious men, Indian Muslim nobles, and common people. It needs to be emphasized that the Khari Boli base of Hindustani was firmly established only in the 18th century. It is also important to note that no long and connected specimen of the language is available during the period 1200–1650 for reconstructing its continuous history, except *Bikat Kahani* by Afzal, which appeared 300 years after Khusro.

The next important phase in the development of Hindustani is seen in the Muslim Sultanates of the Deccan by the end of the 14th century. In the 17th century, Hindustani flourished as a literary language of the North Indian Muslims who settled in the Deccan. It is referred to as Dakhini Hindi or Urdu. Although it shows some elements of local languages, such as Kannada and Telugu, it clearly attests to the source dialects of Panjabi and Haryanvi. Furthermore, the literary works produced in Dakhini or Hindustani were written in the Perso-Arabic script, which "fixed the orientation of the language," though Hindustani retained its indigenous character (Chatterji, 1960). The use of the Perso-Arabic script had serious implications for the development of Hindustani in the late 18th and 19th centuries.

Hindustani is a Central Indo-Aryan language based on Khari Boli (Khaṛi Boli). Its origin, development, and function reflect the dynamics of the sociolinguistic contact situation from which it emerged as a colloquial speech. It is inextricably linked with the emergence and standardization of Urdu and Hindi. The linguistic relationship among Hindustani, Urdu, and Hindi highlights the theoretical and empirical problems of linguistic analysis and description. It also reveals the politics of language conflict and identity in the complex sociopolitical and multilingual situation of India.

Origin and Development

Hindustani as a colloquial speech developed over almost seven centuries from 1100 to 1800. The Muslims conquered northern India from the 10th to the 13th centuries and settled down in the country, bringing with them their Persian language and culture. This mixing of cultures provided the contact situation for the emergence of Hindustani as a lingua franca. During this period, the literary language Apabhraṁśa seemed to be in a state of transition from Middle Indo-Aryan to the New Indo-Aryan stage. Some elements of early Hindustani appear in compositions of the saints of Nath Panth. However, the distinct form of the lingua franca Hindustani appears in the writings of Amir Khusro (1253–1325), who called it Hindwi. Chatterji (1960) argued that the term 'Hindustani' came to be used at the close of the 17th century. J.J. Ketelaer is said to have written the first European grammar of Hindustani in Dutch in 1715.

During the early stage of language contact, Hindustani showed a great deal of mixing of dialects. In particular, the western dialect group of northern India – Braj Bhasha, Bangaru (Haryanvi), and to some extent eastern Punjabi – formed the basis of the vernacular Hindustani. The Perso-Arabic words were also used by traders, religious men, Indian Muslim nobles, and common people. It needs to be emphasized that the Khari Boli base of Hindustani was firmly established only in the 18th century. It is also important to note that no long and connected specimen of the language is available during the period 1200–1650 for reconstructing its continuous history, except *Bikat Kahani* by Afzal, which appeared 300 years after Khusro.

The next important phase in the development of Hindustani is seen in the Muslim Sultanates of the Deccan by the end of the 14th century. In the 17th century, Hindustani flourished as a literary language of the North Indian Muslims who settled in the Deccan. It is referred to as Dakhini Hindi or Urdu. Although it shows some elements of local languages, such as Kannada and Telugu, it clearly attests to the source dialects of Panjabi and Haryanvi. Furthermore, the literary works produced in Dakhini or Hindustani were written in the Perso-Arabic script, which "fixed the orientation of the language," though Hindustani retained its indigenous character (Chatterji, 1960). The use of the Perso-Arabic script had serious implications for the development of Hindustani in the late 18th and 19th centuries.

The development of Hindustani in North India lagged behind its use as a literary language in the Deccan. One of the reasons for this was the recognition of Persian as an official and court language and its acceptance by the North Indian elites and court nobles. Second, Braj Bhasha flourished as a literary language there. It was recognized by the Mughul emperor Akbar, and his courtier Khan Khanan Rahim used it for his poetic compositions. Though after Khusro an early form of Hindustani can be found in the poetry of Kabir and other religious preachers and saints, it was not cultivated as a literary language. Furthermore, Hindustani was spoken among the nobles at Delhi and Agra and by Moghul emperors from Akbar onward at home. However, it was not taken up seriously or written in the Perso-Arabic script in North India as in the Deccan.

It was only after Wali, a poet of Dakhini, arrived in Delhi that Hindustani began to develop as a literary language in the North. Wali used what is known as Rekhta/Hindi and showed that it was capable of great poetry. Rekhta means 'scattered' and implies that it had not yet so much been Persianized as happened later. It is known as the earliest form of Urdu-Hindustani poetical speech. Urdu as a language name occurs for the first time in 1776 in a couplet by the poet Mashafi (1750–1824). However, the use of Urdu referring to camp, court, or city (Zaban-e-Urdu or Zaban-e-Urdu-e-Shahi or Zaban-e-Urdu-e-Mualla) had been current since 1560.

After Wali, such stalwarts as Khan Arzu (1689–1756), Shah Hatim (1699–1781), and Mazhar Janejanan (1700–1781) made conscious efforts to Persianize Hindustani and weed out the Braj Bhasha or indigenous elements from it. Thus, Urdu-Hindustani was in a developed state by the end of the 18th century. John Gilchrist produced the first grammar of Hindustani. He justified the usage of the term 'Hindustani' for the language, as well as for its speakers. Insha Allah Khan Insha's *Darya-e-Latafat* (*The river of elegance*, 1807) presented an early linguistic study of the dialects of Delhi and Lucknow. There was also a tendency to identify Urdu-Hindustani largely as a Muslim language and Hindi/Hindwi as a language of the Hindus.

However, it is important to note two points about the development of Hindustani at the beginning of the 19th century. First, after the establishment of Fort William College by the British, prose began to be written in the emergent Khari Boli that formed the basis of Hindustani. Urdu-Hindustani and Hindi developed as two distinct styles of prose produced by the writers associated with Fort William College. Chatterji (1960: 211–212) rightly remarked that Hindustani "came out into the modern world as a vehicle of prose in its twin form, High Hindi and Urdu, about 1800." Second, the process of identification of Urdu with Muslim and of Hindi with Hindus continued during the entire 19th century and the first half of the 20th century. The development and standardization of both Urdu and Hindi had sociopolitical implications with regard to Hindustani (*see* **Urdu** and **Hindi**).

Forms of Hindustani

It is quite clear that the evolution of Hindustani was spread over seven centuries from 1100–1800. Before it was firmly established on the Khari Boli spoken in the surrounding region of Delhi, it was known by several names, such as Hindwi/Hindi, Dehalvi, and Rekhta, and was made up of several western dialects mixed together. The two forms of High Hindi and Urdu that emerged by 1800 may be described as a standardization of the grammar of the "Vernacular Hindustani" dialect (Chatterji, 1960: 169). The Perso-Arabic script and Perso-Arabic vocabulary of Urdu distinguish it from High Hindi, which uses Devanagari script and Sanskrit vocabulary.

The third form of Hindustani represents the basic Khari Boli and may be considered as Hindustani proper. It holds a balance in its vocabulary as it contains only those Persian and Sanskrit words that have been fully assimilated with the structure of its *tadbhav* or native words. According to Chatterji (1960), this form of Hindustani represents colloquial speech and can be terse as well as elaborate. It is simple in grammatical structure and precise in its sounds. In its spoken colloquial form, it is used for communication by a large number of speakers in India, Pakistan, and other parts of the world. It may therefore be considered, according to Chatterji (1960), as one of the great languages of the world.

Three other forms of Hindustani may be recognized, though they show a great deal of mixture from the local dialects and simplification of grammar. First, speakers of the Western Uttar Pradesh, Eastern Panjab, Haryana, and Rajasthan may speak what may be referred to as Vernacular Hindustani with their dialect accent or other features. They may be considered, as Kelkar (1968) maintained, to be 'adherent' speakers of Hindi and Urdu who easily ascend the scale of culture and education and accept them as super-posed languages. Second, it is possible to recognize what may be referred to as Bazaar Hindustani spoken by the masses in market situations across the country. This form may show a simplification of grammatical gender and mixing of local dialects, depending upon the region and the language contact situation. Finally, the Dakhini spoken in Karnataka,

Andhra Pradesh, and other regions in the South may be considered to be a form of Hindustani. Though it has a distinctive grammatical structure, in vocabulary it shows affinity with Hindustani. It is spoken mainly at home and shows some local literary activity. However, the Dakhini speakers regard standard Urdu as the super-posed variety and have accepted it for all formal purposes.

Hindustani as a Symbol of Unity

The process of the identification of Urdu and Hindi with Muslims and Hindus, respectively, that started in the early 19th century reached its culmination in the first quarter of the 20th century. The formation of voluntary language associations for these languages and the development of both Muslim and Hindu revivalism strengthened this identification. This congruence of linguistic and religious identities not only increased language conflict between Urdu and Hindi but also led to the expanded use of Hindustani. In the wake of the Indian independence movement, Gandhi saw the potential for the use of Urdu and Hindi to produce political conflict and so promoted Hindustani as a symbol of unity. In 1925, he persuaded the Indian National Congress to accept Hindustani as the official language for its proceedings. Under the influence of Gandhi, many national leaders emphasized the role of Hindustani not only for communal harmony between Muslims and Hindus but also for bringing about national unity. In 1937, Nehru recognized the potential of Hindustani to spread all over the country and declared that it should be officially recognized as an all-India language.

However, the acceptance and rapid spread of Hindustani at both regional and national levels failed to bring about any fundamental change in the position of the protagonists of Urdu and Hindi. The divergence between Urdu and Hindi languages, on the one hand, and the congruence of linguistic and religious identities, on the other, became so salient politically in the process of nationalism and nation formation that Hindustani failed as a symbol of unity. Das Gupta (1970:57) pointed out that the identification of national, linguistic, and religious solidarity was "more integral and pervasive" in the case of Muslims than with the Hindus.

After it became clear that India would be partitioned along religious lines, the question of Hindustani took a different turn in the fourth Constituent Assembly session in July, 1947. The persuasiveness of Hindustani as a national language had lost much of its appeal. The supporters of Hindi saw it as "a symbol of appeasement of the Muslim concern for Urdu" (Das Gupta, 1970: 130–131). They gave up their support for Hindustani and demanded that Hindi alone, written in the Devanagari script, be accepted as the official language of India. The acceptance of Hindi as the official language of India in 1948 gave the final blow to Hindustani as a symbol of unity. However, Hindi lost the overall support that Hindustani had gained at the national level in the wake of the independence movement. Recent debate on the failure of Hindustani as symbol of unity and a common language of both Urdu and Hindi speakers throws light on politics of nationalism, language engineering and acrimony between the two communities blaming one another for this (Rai, 2000; Hasnain and Rajyashree, 2004; Trivedi, 2004).

Problems of Linguistic Description

The problems of linguistic description of Hindustani are inextricably involved with those of Hindi and Urdu. Linguists, historiographers of Hindi and Urdu, and scholars of literature and textual criticism have mainly tried to grapple with the linguistic description of Hindi and Urdu, as is evident from the phonological and grammatical studies of those languages done during the last half-century. Kelkar (1968:1) has argued that contemporary standard Hindi-Urdu "consists of a gamut of integrated variation that need to be studied together – within a single frame work." However, he concentrated mainly on standard Hindi-Urdu and considered Hindustani as "relegated to history" (Kelkar, 1968: 9), though he included it under the Hindi-Urdu continuum of styles and took care of regional color to a certain extent.

Though the linguistic description of Hindustani has not drawn the attention of linguists for historical reasons, it raises several theoretical and empirical issues, which are relevant for linguistic analysis of both Hindi-Urdu and Hindustani. First, in addition to the dictionary of Hindustani written by John Gilchrist at the end of the 18th century, several other dictionaries were published in the late 19th century. It would be relevant to explore the range of borrowed Perso-Arabic words included in the dictionaries and to find out how far they have been assimilated or have become current in present-day colloquial speech. Second, the works of several writers have been published in both Urdu and Hindi and have been claimed equally as Hindi-Urdu writers. Prem Chand occupies an important position in this respect. It would be worthwhile to explore the distinctive alternative use of Sanskrit or Persian words in Hindi and Urdu versions of his works and to study whether the common vocabulary comprises native or *tadbhava* or fully assimilated Sanskrit and Persian words. Third, a number of textbooks have

been published for teaching standard Hindi and Urdu to foreigners. Although they reflect common core grammar and distinctive characteristics of the respective languages, it would be relevant to study the range of Sanskrit and Perso-Arabic words that form an integral component of these languages. Doing so would help determine how far these textbooks support the common base of colloquial Hindustani. Fourth, it would be necessary to explore to what extent the linguistic analysis of Hindi and Urdu is based on the spoken data. Only this type of analysis can show the extent to which they differ in the choice of Sanskrit and Persian words and to what extent these words are common in both the spoken varieties and represent the colloquial Hindustani.

Finally, some studies show lexical differences between Hindi and Urdu and question the notion that they are two distinct languages. They raise significant issues related to the processes of convergence and divergence, the difficulty of drawing boundaries between Sanskrit and Perso-Arabic words assimilated in both Hindi and Urdu, and the implications of choice for comprehension. These issues can be explored only on the basis of a large corpus. A corpus of 3 million words is now available for both Hindi and Urdu at the Central Institute of Indian Languages in Mysore. On the basis of a comprehensive sample, it would be possible to explore in what kinds of genres/texts both Hindi and Urdu show a common base of colloquial Hindustani and how they differ from one another, on the one hand, and from Hindustani, on the other, in terms of what kinds of Sanskrit and Perso-Arabic words they use. In short, the research on the issues raised above can bring an understanding of the basic linguistic structure of Hindustani and the superimposed structure of Hindi and Urdu that is characteristic of both the spoken and written styles.

Hintikka, Jaakko (b. 1929)

J Maat, University of Amsterdam, Amsterdam, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Jaakko Hintikka has been at the forefront of developments in logic, linguistics, and philosophy for decades. He was born in Vantaa, Finland, in 1929. He attended high school at Kerava, and after that went to the University of Helsinki. In 1948–1949, he was an exchange student at Williams College in Massachusetts. After obtaining his Ph.D. at Helsinki in 1956, he became a Junior Fellow at Harvard. In 1959, he was appointed Professor of Philosophy at the University of Helsinki, a post he kept until 1970, when he became Research Professor of the Academy of Finland. Dissatisfied with the funding policies of the Academy, he resigned in 1981. In 1964, he was John Locke Lecturer at the University of Oxford. From 1965 to 1982, he was also Professor of Philosophy at Stanford. From 1978, he held a professorial appointment at Florida State University, until he became Professor of Philosophy at Boston University in 1990, where he still teaches. In 1978, he married his second wife, Merrill Bristow Provence, with whom he wrote a series of joint papers and a book.

Jaakko Hintikka has been at the forefront of developments in logic, linguistics, and philosophy for decades. He was born in Vantaa, Finland, in 1929. He attended high school at Kerava, and after that went to the University of Helsinki. In 1948–1949, he was an exchange student at Williams College in Massachusetts. After obtaining his Ph.D. at Helsinki in 1956, he became a Junior Fellow at Harvard. In 1959, he was appointed Professor of Philosophy at the University of Helsinki, a post he kept until 1970, when he became Research Professor of the Academy of Finland. Dissatisfied with the funding policies of the Academy, he resigned in 1981. In 1964, he was John Locke Lecturer at the University of Oxford. From 1965 to 1982, he was also Professor of Philosophy at Stanford. From 1978, he held a professorial appointment at Florida State University, until he became Professor of Philosophy at Boston University in 1990, where he still teaches. In 1978, he married his second wife, Merrill Bristow Provence, with whom he wrote a series of joint papers and a book.

Hintikka has been awarded numerous prizes and honorary doctorates and lecturerships. His first paper appeared in 1953, and over 300 papers of which he was the author or co-author have been published since. He has written and co-authored more than 30 books, and continues to write on a range of topics.

Hintikka's accomplishments in logic and linguistics are many and varied. He was a pioneer of possible-worlds semantics and modal logic. A central element in his work is a theory called Game-Theoretical Semantics, which he created in the late 1960s, and subsequently developed in collaboration with others. The theory was inspired by a Kantian perspective on knowledge and by the Wittgensteinian notion of 'language games,' the active practices in which linguistic meaning is constituted. Game-Theoretical Semantics uses the method of a strictly regulated game to determine the truth or falsity of a given sentence. If the player whose goal it is to verify the statement expressed by the sentence has a winning strategy, the sentence is true, and if the other player has a winning strategy, it is false. If applied to formal languages of first-order logic, the semantics is equivalent to the more usual Tarski-type definition of truth. But through modification of rules, the semantic games can also be applied to nonclassical logics. Furthermore, they can be employed in the semantics of natural languages. As Hintikka and his associates have shown, the theory can account for the semantic behavior of anaphoric pronouns and explain phenomena of coreference in English. It is not restricted to sentential meaning, but can deal with issues such as discourse anaphora as well. An important aspect of the theory is its ability to model imperfect information through partially ordered quantifiers, which, Hintikka has argued, occur in English sentences. Other major contributions to linguistic theory by Hintikka are concerned with the theory of questions and answers and with the methodology of linguistics.

Hintikka has achieved important results in mathematical logic. Besides, he has written at length on the philosophy of science, the history of philosophy and ideas, the foundations of cognitive science, and aesthetics. He has also contributed significantly to the philosophy of mathematics.

Hippocrates: Theory of the Sign

J Deely, University of St Thomas, Houston, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

Hippocrates was born c. 460 B.C. on the Greek island of Cos, and he died on the Greek mainland in the northern region of Thessaly c. 377 B.C., through which pass all the land routes connecting the Greek peninsula with the lands to the north. Thus he lived something like 83 years, and the place of his dying may be taken as symbolic of the lines of influence through which his work and memory would pass into the intellectual culture of later generations wherever medicine would come to be practiced in a scientific manner, that is to say, on the basis of accumulated observations linked by hypotheses premised on natural causes at work in the organs of the body. He was definitely a historical figure, yet the writings traced to him are more by influence than by authorship; whence his status is legendary, more than historical, but less than mythical.

Hippocrates is known as the 'Father of Medicine,' and by the same title (cf. Sebeok, 1986: 46) he enters also the history of semiotics, the knowledge arising from the study of the action of signs or 'semiosis.' For, of the triune tradition from which the field of semiotics has come to be fashioned, the medical tradition, with Hippocrates as its ancestral figure, is the oldest of the three clearly to take fashion. By a "sliding outward in an overlapping, telescope-like fashion" (Sebeok, 1989: 6), philosophical semiotics "emerges from the Hippocratic legacy." The "specifically linguistic preoccupation with signs," in turn, can be glimpsed at least as early as Plato's *Cratylus* (c. 399–390 B.C.) and *Sophist* (c. 359–347) (Deely, 2001: 57). Thus Sebeok deems the metaphor of a 'semiotic tripod' to be one historically justified to express the fact that semiotics globally considered is an interweave of the medical, philosophical, and linguistic traditions together, provided we are able to deal with "the ungainly figure of a three-legged stand with rubbery legs of unequal length" (Sebeok, 1975: 31). Hippocrates stands, in the perspective of this metaphor, as "the Father and Maestro of the semiotic development as a whole" (Kleinpaul, 1972: 103).

It is crucial to realize that, in the ancient Greek development of medicine and philosophy alike, words are not yet envisioned as signs. Only natural events (in contrast to divinations and supernatural auguries) are envisioned to constitute the realm of signs, σημεία ('semeia') (Manetti, 1993; cf. Deely, 2001). Not until Augustine will the ancient Greek notion of the σημεῖον ('semeion') be envisioned as a subspecies of sign in general, the natural sign, coordinate with the linguistic sign as the paradigm of the conventional sign.

Hippocrates established symptoms of disease – in other words, "clinical semiotics" (Shands and Melzer, 1975) – as paradigmatic to the study of signs in nature. Notice that such signs in large part are unwitting, connected with their signified objects quite apart from the volition, cleverness, or convention involved in 'intentional' signs. Hippocrates (and Galen after him) thus formulated "a broad, if not yet global, semiotic theory of diseases which, to rephrase it in the humblest terms, asserts that the most devastating among them amount to a problem of communication – cells and tissues respond to misinformation, or misinterpret environmental clues to which they overreact" (Sebeok, 1989: 8; cf. Thomas, 1974).

As the first to displace belief in the causes of ailments as supernatural and treatment as proper to magic and religion with the affirmation of natural causes and studied cures, by his establishment of symptoms as paradigmatic to the class of natural signs, Hippocrates also set human thought on the trail that would eventually lead to a global semiotics as the defining phenomenon of a postmodern intellectual culture embracing the study of the action of signs wherever that action occurs, which turns out to be everywhere that objects come to be known in the web of human experience.

Hirayama, Teruo (b. 1909)

K Maekawa, The National Institute for Japanese Language, Tokyo, Japan

© 2006 Elsevier Ltd. All rights reserved.

Teruo Hirayama was born in 1909 in Miyazaki prefecture in the Kyūsyū area of Japan. For over 50 years he has been one of the most active field linguists in Japanese dialectology. By the time of his 70th anniversary, the localities he had surveyed exceeded 4000 in number. The linguistic materials Hirayama and his colleagues gathered and published have provided a firm basis for the comparative study of Japanese dialects. Hirayama's description of the accentual systems of Kyūshū dialects is of outstanding scientific value.

Hirayama graduated from Kokugakuin University, where he learned Japanese literature and linguistics, in 1935. This was the time when the linguistic study of Japanese lexical accents saw remarkable progress, exemplified by the discovery of the phonological correspondence of accentual systems among contemporary dialects (by Shirō Hattori in 1933) and the discovery of historical correspondence between the accentual system of 11th century Kyoto Japanese and those of contemporary dialects (by Haruhiko Kindaichi in 1937).

Under the influence of these studies, Hirayama began an extensive field survey of the Japanese dialects in the mid-1930s, and published his first book, *Zennihon Akusentono Shosō* (Aspects of Japanese accent), in 1940. His other early publications included *Kyūsyū Hōgen Onchōno Kenkyū* (Studies on the accent of Kyushu dialect, 1951) and *Nihongo Onchōno Kenkyū* (A study of Japanese accent, 1957), as well as many journal papers. As can be seen from the book titles, his main research interest was the accentual systems of Japanese dialects.

Hirayama started teaching Japanese linguistics at Tokyo Metropolitan University (known as Tokyo Metropolitan College before 1945) in 1940, became a full professor in 1962, and stayed in the position until 1973. He then moved to the Institute for Japanese Culture and Classics of Kokugakuin University and stayed there until 1979. While he was in these positions, Hirayama conducted collaborative field surveys with his students and colleagues. The results of the surveys included *Ryūkyū Hōgenno Sōgōteki Kenkyū* (Systematic survey of Ryukyu dialects, co-edited with Ichirō Ōshima and Masachie Nakamoto, 1966) and *Satsunan Shotōno Sōgōteki Kenkyu* (Systematic survey of Satsunan Islands, 1969), among many others.

Hirayama's most recent work is the massive nine-volume *Gendai Nihongo Hōgen Daijiten* (Dictionary of Japanese dialects, co-edited with Ichiro Oshima, Masao Ohno, Makoto Kuno, Mariko Kuno, and Takao Sugimura, 1992–1994). The first six volumes of the dictionary are devoted to a systematic linguistic description of the 'basic vocabulary' gathered from 72 localities all around Japan, and the last three are devoted to various indexes.

For his long-term contributions to Japanese linguistics, the Japanese government awarded Hirayama the title of Person of Cultural Merit in 1994.

Hirt, Hermann (1865–1936)

S A Romashko, Moscow, Russia

© 2006 Elsevier Ltd. All rights reserved.

Born in Magdeburg, Hermann Hirt studied Indo-European linguistics and Germanic philology in Leipzig and Freiburg. His teachers were the main representatives of the *Junggrammatiker* ('young grammarian') school: F. Zarncke, K. Brugmann, A. Leskien, and E. Sievers. However, Hirt went his own way quite early in reconstruction of Indo-European language and culture. His first book (Hirt, 1895) treated the less elaborate (at that time) problem of Indo-European accentuation in its relation to different language units: from syllable and word to phrase and sentence. The next publication (Hirt, 1900) was an attempt to find the connection between Indo-European vowel alternation (ablaut) and prehistoric evolution of Indo-European accent. These early works of Hirt were marked by one of the main features of his studies: the search for regularities, unifying the different elements of the protolanguage into an integral structure. Several years later, Hirt published a voluminous book on the Indo-Europeans and their culture (1905–1907). In his view, the Indo-Europeans were an agricultural community, and he placed their homeland in the plains of northern and northeastern Europe. He insisted on an interdisciplinary approach to linguistic palaeontology, including not only purely linguistic methods (like semantic reconstruction), but also the results of archaeological, ethnological, ethnographic, etc., investigations.

In 1896, Hirt received a position of associate professor at Leipzig University, and from 1912 till the end of his life he was a full professor at the University of Giessen. After rather practical publications on the history of German (German, Standard) (cf. Hirt, 1909) Hirt dedicated himself for a long time to his *Indo-European Grammar* (1921–1937), a work summarizing his thoughts on Indo-European and its reconstruction. The fate of Hirt's ideas was quite a paradoxical one. On the one hand, many of his solutions in Indo-European reconstruction were rejected by most of his colleagues (or recognized with substantial reservations); however, on the other hand, his general methodological positions and some parts of his reconstructions were widely accepted and are still in discussion nowadays. Hirt's reconstruction of Indo-European reduced vowels (i.e., he did not accept syllabic sonants for the protolanguage, positing a combination of reduced vowel + sonant instead) was not shared by most linguists, but the possibility of a vowel reduction in an early period of the protolanguage, and the connection between accent and vowel alternation and between vowel alternation and morphological structures were continued in reconstructions by many linguists (e.g., J. Kurylowicz or W. P. Lehmann). Besides this systemic approach, also very important was Hirt's view of the protolanguage as a real language, with its own history, including possibilities of structural transformations in the course of time.

in its incorporation of Schlegel's Romantic conception of language, aspects of which were to continue to underlie linguistic thought for much of the next half-century.

It was already acknowledged that language involved the expression of two kinds of content: that of the roots of the words and that of the various relationships among the roots; but languages differed in the way that the latter kind of content was expressed. In some, such as Sanskrit and the classical European languages, it was effected by changes in the form of the word itself; in others, such as Chinese and to varying extents many of the modern European languages, by the addition of further words or particles. Schlegel regarded the former type of language as far superior to the latter, because it was **organic**, a term which had deep significance in Romantic thought. Entities were 'organic' if they contained their whole essence and potential development within themselves, like a flower within a seed, otherwise their development was merely 'mechanical.' For Schlegel, Sanskrit and the classical languages were organic because all the content of the words was contained within the words themselves. Relationships were expressed by inner changes (inflections) rather than by additional words or particles. It is not clear whether he had in mind only the kind of modifications to the root known as 'ablaut,' found in English forms such as *sing, sang,* and *sung*, or whether he also included inflectional affixes in his definition of 'organic.' However, Friedrich's brother August Wilhelm clarified the matter by explicitly recognizing three types: those consisting only of roots and therefore (in his view) lacking any grammatical structure; those which make use of affixes with a meaning of their own; and 'inflectional' languages, which use changes in the roots themselves or add a small number of syllables to indicate such categories as case or tense. For him, as for his brother, the last of these was the most perfect, the second type less so, while the first was believed to be so imperfect as to make literary or scientific discourse virtually impossible.

The Schlegels' interests were really cultural and literary rather than linguistic, but their ideas were nevertheless influential. For a more technical linguistic contribution we must turn to three other scholars of the period who are regarded as the 'Founding Fathers' of 19th century historical and comparative linguistics: Rask, Bopp and Grimm. They all shared Schlegel's organic view of language, but their contributions were more sober, and they can be said to have put the analysis of language itself, as well as relationships among languages, on a surer footing.

The Danish scholar Rasmus Rask (1787–1832) has often been considered merely as a precursor of Grimm, recognizing the phonological relationships between Germanic and the other Indo-European languages which were later given more systematic form by the latter. The list of correspondences given in his prize essay *Undersögelse om det gamle Nordiske eller Islandske Sprogs Oprindelse* (*Investigation of the origin of the Old Norse or Icelandic language*), published in 1818, shows a clear grasp of these relationships, despite a number of errors (see Table 1). However, to restrict his contribution to this is to undervalue it, because his work reflects wide-ranging scholarship and a high degree of methodological sophistication.

Table 1 Rask's correspondences between Greek sounds and those of Latin and Icelandic

π	becomes *f*: πλατυς-*flatur*, πατηρ-*fadir*.
τ	becomes *þ* : τρεις-*þrír*, *tego-eg þek*, τυ - *tu* - *þú*.
κ	becomes *h* : κρεας-*hrœ*, *cornu-horn*.
β	is mostly kept : βλασανω-*blad*, βρυω-*brunnr*.
δ	becomes *t*: δαμαω-*tamr*, *dignus-tíginn*.
γ	become *k*: γυνη-kona, γενος-*kyn* or *kin, gena-kinn*, αγρος- *akr*.
φ	becomes *b*: φηγος-Danish *bøg*, *fiber*-Icel. *bifr*, φερω- *fero-eg ber*.
θ	becomes *d*: θυρη-*dyr*, θεος-Latin *deus*.
χ	becomes *g*: χυω-Danish *gyder*, εχειν-*ega*, χυτρα-*grýta*, χολη-*gall*.
'	becomes *s*: ἑξ-*sex*, ἁμα-*saman*, ὑπνος-*svefn* Danish *søvn*.

18th century speculations were largely based on lexical comparisons, which frequently produced spurious results. Rask recognized that lexical comparison of languages can be misleading and that the linguist must therefore concentrate on 'core' vocabulary:

> "A language, however mixed, belongs to the same language class as another, when the most essential, most concrete, most indispensable and very first words, the foundations of language, are common to them both."

However, he saw that grammatical correspondences are a more reliable guide to relationships, and, furthermore, that the more elaborate the morphology the older the language is likely to be:

> "Whichever language has the more complex grammar is the more unmixed, the more original, older and closer to the source; for grammatical inflections and endings are constantly worn off when new languages emerge."

He also noted that relationships need to be established by regular phonological correspondences, and even set up rules for determining them.

> "When correspondences are found between two languages in such words, in fact so many of them that rules can be deduced for the shifts of letters from one to the other, a basic kinship is found between these languages; especially when they are matched by similarities in the structure and system of the two languages."

(It should be noted that 'letter' at this time included 'speech sound'; the latter term was not yet in use.)

Despite this methodological awareness, the fact that Rask did not incorporate Sanskrit into his comparisons (though he covered many other languages, comparing Icelandic with languages from virtually all the families of Europe and even beyond) indicates that his work did not profit from the new discoveries and was in a number of respects a continuation of 18th century comparative methods rather than a radical new departure.

Franz Bopp (1791–1867) studied Sanskrit in Paris and in 1816 published his book *Über das Conjugationssystem der Sanskritsprache in Vergleichung mit jenem der griechischen, lateinischen, persisichen und germanischen Sprache* (*On the conjugation system of Sanskrit in comparison with that of Greek, Latin, Persian and Germanic*). This is mainly concerned with the morphological analysis of the ancient languages, and attempts to reveal the 'organic' nature of the verb forms of Sanskrit (in Schlegel's sense), which are considered to involve either modifications of the root or the fusing of the root with forms of the verb 'to be.' By comparing the Sanskrit forms with those of the other languages, he shows that this organic structure was gradually destroyed, to be replaced by mere 'mechanical' combinations. The personal endings of the verb are similarly considered to derive from independent pronouns. Bopp developed his morphological analysis in later work and to some extent moved away from Schlegel's view of the early Indo-European languages as inflectional. Because the inflections could be seen as independent meaningful elements, the original structure must in fact have been agglutinative. However, he continued to hold to Schlegel's conception of an originally perfect, organic language that later decayed. Although some of his analyses are fanciful, his systematic approach to morphological analysis and to the comparison of morphological structure – he was the first to use the term 'comparative grammar' – established itself as the model for subsequent work, and he is by many regarded as the true founder of the new comparative linguists, though it has also been maintained that his interests were **merely** comparative, and not historical, and that he thus continued the 18th century rationalist tradition.

Perhaps the best known of the early 19th century linguists is Jacob Grimm (1785–1863), principally for 'Grimm's Law,' which states in a systematic fashion the relationships between the Germanic consonants and those of the classical languages. In this he was certainly influenced by Rask; his formulation of the 'law' (the term is an anachronism, since he never used it himself) appeared in the second edition of his *Deutsche Grammatik* (*German[ic] grammar*) of 1822, after he had read Rask. Grimm's formulation of the *Lautverschiebung* ('sound shift') owed not a little to his Romantic idealism and also to his ignorance of phonetics, since by including the High German consonant shift, which had a similar form but was quite separate from the original shift, as part of the same process, and also by equating Germanic fricatives with the Greek aspirated plosives, he was able to view the whole process as a single, mystical, and organic whole (see Table 2).

Table 2 'Grimm's Law' according to Grimm

Greek	P	B	F	T	D	TH	K	G	KH
Gothic	F	P	B	TH	T	D	...	K	G
Old High German	B(V)	F	P	D	Z	T	G	CH	K

Figure 1 Grimm's 'Kreislauf.'

Using Latin terms for the different classes of sounds, where *tenues* (T)=voiceless plosives, *mediae* (M)=voiced plosives, and *aspiratae* (A)=voiceless aspirated plosives, Grimm is able to reduce the whole shift to a characteristically organic circular process, or *Kreislauf* (see Figure 1).

Grimm's Romanticism is also seen in his belief in the original perfection and subsequent decay of language, and in his view of language as a reflection of the character of a nation; for him, 'Grimm's Law' was an expression of the Germanic 'spirit.'

Standing somewhat apart from the work of Rask, Bopp, and Grimm is that of Wilhelm von Humboldt (1767–1835). A diplomat and educationalist as well as a linguist, and with a broad knowledge of language and languages, Humboldt belonged to an older generation than these three; indeed, though his main works were published in the 1820s and 1830s, in some respects he is an 18th century figure. His best known work, *Über die Verschiedenheit des menschlichen Sprachbaues und ihren Einfluss auf die geistige Entwickelung des Menschengeschlechts* (*On the variety of human language structure and its influence on the intellectual development of mankind*), was published in 1836, after his death. As Prussian Minister of Education, he was instrumental in

procuring for Bopp his chair in Berlin, and he was able to exercise considerable influence in promoting research and teaching in linguistics.

Humboldt's work differs from that of others of this period in not being primarily concerned with the historical development of languages; his interests were comparative and typological rather than historical. He is nevertheless a Romantic in his acceptance of the organic view of language, though for him this appears to be rather broader in scope than for his predecessors: a language is organic in the sense that all its parts belong together and must be seen in the context of the whole – a principle that foreshadows Saussurian structuralism. He is concerned with the *innere Sprachform* ('inner linguistic form') of a language, the organization of its grammar and meaning, as its defining characteristic.

Humboldt's writings are diverse and somewhat diffuse, but he is noted especially for two specific ideas: the typological classification of languages and the principle of linguistic relativity. In both cases there is considerable debate about Humboldt's originality and his sources, and there is no doubt that his views were a continuation and development of earlier ideas. Clearly, he did not invent typology, which, as we have seen, was an important aspect of the Schlegels' work, and language classification had been undertaken by 18th century scholars. Humboldt is, in fact, even skeptical about the possibility of a neat classification of languages, preferring to recognize a scale between the two extremes of inflecting and isolating languages. Nevertheless, his contribution is important, as he discusses the principles, and the difficulties, in greater detail than his predecessors. As far as the source of relativity is concerned, we may go back to Herder (1744–1803), and beyond. In his prize essay of 1772, entitled *Abhandlung über den Ursprung der Sprache* (*Treatise on the origin of language*), Herder had attempted to link language and thought, arguing that the two evolved together. Humboldt combined this idea with Romantic conceptions of the relationship between language and nation, and thus relativized Herder: language and thought may be interdependent, but because different peoples speak different languages, their thought must also be different. This principle influenced a number of subsequent scholars, and has often been regarded as a precursor of the 20th century Sapir-Whorf Hypothesis. Humboldt took from Kant the principle of the ordering of the world through our ideas, but again relativized it: we order the world through our language. Language is therefore not simply a finished product (*ergon*) but an activity (*energeia*). In all this, it becomes clear that Humboldt's interest in language comparison has as its aim not the history of languages as such, but rather languages as a reflection of different ways of expressing thought.

Linguistics at the Mid-century

The Romantic view of language and languages had been a major force during the first half of the century (though whether it had promoted or impeded linguistic study is a matter of debate), but by the middle of the century this view had begun to wane. The generation after Rask, Bopp, and Grimm saw a steady expansion and development of the subject; August Pott (1802–1887), for example, did extensive work on the Indo-European lexicon, while other scholars applied the approach adopted by Grimm in relation to the Germanic languages to other language families, including those of non-Indo-European stock. At the same time, the principles and methods of German scholarship were also spread to other countries; in England, for example, by Max Müller (1823–1900), in his popular *Lectures on the science of language* (1861).

From a theoretical point of view, the period is characterized by several intellectual movements of which the main two are the rise of a more objective, positivist approach, and, inspired particularly by Darwin's *The origin of species* (1859), the development of theories of historical evolution, both of which were to have an important influence on linguistics. These movements gave rise in particular to detailed 'scientific' work on language history and attempts to provide mechanisms and explanations for language change based on natural and physical, rather than the Romantics' supernatural and metaphysical, principles.

The most important linguistic scholar of the period is August Schleicher (1821–1868); indeed, some see the real 19th century revolution, the development of a 'scientific' historical discipline of language, as commencing with him. His *Compendium der vergleichenden Grammatik der indogermanischen Sprachen* (*Compendium of the comparative grammar of the Indo-European languages*) of 1861–1862, in which he summarized what was then known about the original Indo-European language and its development, showed how far the comparative and historical study of the Indo-European languages, as well as the methodology of comparative linguistics, had progressed since Bopp.

Bopp had ignored phonology in his work, but Schleicher deals with it extensively. Although Bopp had attempted to reconstruct the morphology of the original Indo-European language, Schleicher is both more thorough in his reconstructions and more confident of their validity, even to the extent of composing

Figure 2 Schleicher's 'Stammbaum' for the Indo-European languages.

a fable in the assumed reconstructed language, an enterprise for which – perhaps somewhat unfairly – he was subsequently derided. For Schleicher, such reconstructions were part of the scientific methodology of comparative linguistics because they forced the linguist to give explicit form to his conclusions.

The innovation for which Schleicher is best known is the use of the **Stammbaum** or 'family tree' as a means of displaying the historical relationships between languages. This can be seen as following directly from the principles of reconstruction, because the method proceeds by progressively comparing languages and, in the process of arriving at ancestral forms, establishing degrees of closeness between languages. Schleicher's tree for the Indo-European languages is given as Figure 2.

In these respects, then, Schleicher's work can be seen as an attempt to demonstrate that language is amenable to scientific investigation, by the use of rigorous methodology. However, for Schleicher language was still to be regarded as an **organism**, though not quite in the Romantic sense of Schlegel. For him, language was like a biological organism, which is born, grows old and dies, and has an independent existence, separate from its speakers. Scientific investigation of this organism is therefore analogous to biology, and hence is a natural science, though, in common with other disciplines at the time, it was conceived in historical terms. It is also likely that the model for his Stammbaum was the botanical classification of Linné (Linnaeus).

With regard to his general approach to linguistic history, Schleicher could be characterized as a Hegelian (unlike Humboldt, who could be regarded as a Kantian), in the sense that he viewed the development of language in terms of **progression**. Hence the established typology of languages – isolating, agglutinating, inflecting – was interpreted as having a direction, with a period of growth followed by a period of decay. In 1863, following the publication of Darwin's *The origin of species* in 1859, Schleicher published a pamphlet *Die Darwinsche Theorie und die Sprachwissenschaft* (*Darwinian theory and linguistics*), but although he believed in an evolutionary process for language, he was no Darwinian, because unlike Darwin he maintained his belief in progress and decay. Nevertheless, he again insists that language is an organism, and advocates the application of the methods of the natural sciences, and especially biology, to the study of its development.

Most of Schleicher's reconstructions have been superseded, and his organic view was soon to be abandoned. Even his Stammbaum, though still popular today, was undermined by his student Johannes Schmidt (1843–1901). The tree assumes progressive splitting of languages, but this is an unrealistic model of change; Schmidt's alternative Wave Theory more realistically allows changes to spread from one language to another. Nevertheless, Schleicher is of considerable historical importance in the development of linguistics, and in particular for his advocacy of a 'scientific' approach to language history.

Other linguists of this period, too, looked to the natural sciences for legitimacy, but not always in the same way. Wilhelm Scherer (1841–1886), for example, in his *Zur Geschichte der deutschen Sprache* (*On the history of the German language*) of 1868, took geology as his model, which entailed abandoning not only Schleicher's organic conception but also with it his idea of progression. The geological concept of uniformitarianism – the principle that the forces operating at different times are the

same – cannot be reconciled with Schleicher's notion of a rise to perfection followed by decay; it also suggests that the causes of change are mechanical and lie with the speakers themselves.

We may observe that the mid-century developments just described, specifically the attempts to establish it as a natural science and to account for changes in 'mechanical' terms, were not restricted to linguistics. Similar ideas are found, for example, in sociology, with Herbert Spencer's 'social Darwinism' and his search for the principles of evolution of society. There was, in fact, much cross-fertilization of ideas among disciplines at this time. While linguists borrowed their models from the sciences, linguistic models of change were adopted elsewhere. Spencer and the anthropologist and historian Henry Maine both used language in support of their arguments for uniformitarianism and their belief in the regularity of change; Darwin himself used a linguistic analogy in explaining the development of some organs.

Linguistics in the 1870s

By the 1870s, the aspirations of Schleicher and others to make linguistics a science appeared to be coming to fulfillment. In particular, the idea of **regularity**, of 'laws,' a principle characteristic of the natural sciences, was becoming acceptable. In the early 19th century, such a principle would not have been contemplated; Grimm was unperturbed by the fact that some of the changes that he had described did not take always take place: exceptions simply indicated that "the stream of innovation has passed them by." Indeed, to regard language as completely subject to irresistible mechanical forces would have been incompatible with the Romantic view. But during the 1870s, evidence was accumulating of greater regularity in language change, as mechanical explanations were found for many of the apparent exceptions.

One example of this mechanical regularity is the 'Law of Palatals.' This 'law,' which cannot be attributed unambiguously to any single scholar, has the advantage of explaining two anomalies simultaneously: the occurrence of the Sanskrit palatal consonants and the vowel correspondences between Sanskrit and Greek or Latin. As far as the vowels are concerned, Sanskrit had only three: *a, i* and *u*, while Greek and Latin had five: *a, e, i, o,* and *u*. Although Sanskrit was no longer regarded as identical with the original Proto-Indo-European language, it was nevertheless assumed that many of its features were close to the original state, and it was therefore necessary to explain how the five-vowel systems of Greek and Latin could have arisen from the 'original' three-vowel system. However, the correspondences were too erratic to achieve this: Sanskrit *a* could correspond to Greek and Latin *a, e,* or *o* in an apparently random manner (although in fact, Latin, Greek, and other Western languages were generally in agreement on the vowel concerned). Further, Sanskrit had, in addition to velar consonants, a set of palatals, but the source of these is difficult to establish; furthermore, the two series only contrast before *a*.

The solution to this problem – the Law of Palatals – assumes that the five-vowel system of Greek and Latin, rather than the three-vowel system of Sanskrit, was original, and that palatalization of velar consonants occurred in Sanskrit before the front vowels *i* and *e*. Subsequently, *e* and *o* merged with *a* to give the Sanskrit system. At a stroke, this explanation accounts not only for the anomalies with the palatal consonants (in those cases where palatals occur before *a,* the *a* was originally *e*) but also for the difficulties with the vowels. It requires, of course, that the priority given to Sanskrit, which had hitherto been assumed to have maintained the original system, must finally be abandoned.

A second example of an explanation being found for apparent exceptions is Verner's Law, named after the Danish scholar Karl Verner (1846–1896), who discovered it in 1875. According to Grimm's Law, Indo-European voiceless plosives (*p, t, k*) become voiceless fricatives (*f, θ, x*) in the Germanic languages, but there are some exceptions, both in individual words and in the strong-verb paradigms, where voiced sounds occur instead in some stems. Thus, Sanskrit *bhrátar-*, *pitár-* correspond on the one hand to Latin *frater, pater* but on the other to Germanic (here Gothic) *broþar*, *fadar* ('brother,' 'father'), with a voiceless and voiced sound, respectively (*þ* represents a voiceless dental fricative; the voice distinction has been lost in modern English). Verner noticed that the voiceless sound appeared in Germanic when immediately preceded by the accent in Sanskrit (*bhrátar-*) and the voiced sound when the Sanskrit accent was elsewhere (*pitár-*), though the accent was always shifted to the initial syllable in Germanic. Again, therefore, an apparent exception was, on closer inspection, found to be subject to a rule.

The significance of these and other explanations cannot be overstated, because they appeared to indicate not merely that these particular anomalies and exceptions are susceptible to an explanation and are, in fact, after all regular, but that **all** such anomalies and explanations can similarly be explained. Whereas previously linguists may have acknowledged that there is no rule without exceptions, the contrary view was now expressed: that there is no exception without a rule, i.e., if there appear to be exceptions, it is simply because the relevant rule to account

for them has not yet been found. These cases, and particularly Verner's Law, were therefore hailed as a breakthrough: here was evidence that language change is completely rule-governed and therefore a demonstration of the scientific credentials of linguistics itself.

Verner published his article, entitled 'Eine Ausnahme der ersten Lautverschiebung' ('An exception to the first sound shift') in 1875, and in the following year another significant article appeared, written by Karl Brugmann (1849–1919), entitled 'Nasalis sonans in der indogermanischen Grundsprache' ('Sonant nasal in the original Indo-European language'), which, by postulating syllabic sonorant consonants in Proto-Indo-European, removed further anomalies, as it provided a source for otherwise exceptional sound correspondences in the different languages, and again reinforced the view of change as essentially regular. But the significance of this article went beyond that: it opened up the way to an understanding of the Indo-European **ablaut** (the vowel alternations found, for example, in English *sing, sang, sung*), as these consonants, with 'zero vowel,' fit neatly into the overall pattern of alternations, and it paved the way for the extraordinary monograph *Mémoire sur le système primitif des voyelles dans les langues indo-européennes* (*Memoire on the primitive vowel-system in the Indo-European languages*), published by Ferdinand de Saussure (1857–1913) in 1878, at the age of 21 (Saussure claimed to have made the same discovery as Brugmann at the age of 15). Saussure extended the pattern of the sonorants in the ablaut system to include long vowels, which he analyzed as combinations of short vowels and a further sonorant element which he called a *sonant co-efficient* and which was later called a *laryngeal*. Though virtually ignored at the time, Saussure's proposal was to lead to a complete revision of the reconstructed Proto-Indo-European system in the 20th century.

Though Brugmann's article was more modest, and these consequences were not suspected when it was published in 1876, it was nevertheless clear that the picture of Proto-Indo-European phonology it presented was potentially different from what had hitherto been assumed, especially in Schleicher's *Compendium*. Furthermore, the article involved a kind of reasoning that was not acceptable to the earlier generation of linguists; like Saussure's monograph, it was to some extent based on internal relationships within the reconstructed Proto-Indo-European language and could therefore be regarded as an early instance of what would later be termed **internal reconstruction**. What was at stake here, then, was more than just the tidying up of a few apparent exceptions; it involved the nature of the evidence that is admissible in historical and comparative linguistics.

The Neogrammarians

With these developments, the scene was set for the last phase in the development of 19th century historical and comparative linguistics: the rise of the Neogrammarian 'movement.' The term *Neogrammarian*, a translation of the German *Junggrammatiker* ('Young Grammarians'), was originally a term of ironic disapproval, a nickname given to a group of young and irreverently radical linguists in Leipzig (then the center of Indo-European studies), but it was adopted by the group themselves, at least initially. The linguists associated with this movement were, in addition to Brugmann, Hermann Osthoff (1847–1909), Berthold Delbrück (1842–1922), Hermann Paul (1846–1921), Eduard Sievers (1850–1932), Wilhelm Braune (1850–1926), and a number of others. They had been inspired in particular by the lectures of the Slavic linguist August Leskien (1840–1916), around whom they centered.

The group showed their hand as a result of a public breach with the establishment, personified in this case by the classical scholar Georg Curtius (1820–1885), who had earlier been responsible for establishing Leipzig as the center of linguistic study in Germany. This breach was provoked by the fact that Brugmann published his article on sonant nasals in an issue of a journal of which Curtius was the editor but on this occasion was edited, during Curtius's absence, by Brugmann himself. Curtius disapproved of Brugmann's article, and the argument between the two led to the closure of Curtius's journal and the founding of a new publication, the *Morphologische Untersuchungen auf dem Gebiete der indogermanischen Sprachen* (*Morphological investigations in the field of the Indo-European languages*), by Brugmann and Osthoff in 1878. In its first volume, Brugmann and Osthoff published a *Preface* which can be regarded as the manifesto of the Neogrammarian movement.

In this *Preface*, Brugmann and Osthoff rather provocatively criticize 'the older linguistics' for numerous alleged failings: it has approached its object without really understanding how human speech works; it has concentrated on the purely physical side of speech and neglected the psychological side; it has been obsessed with reconstructing the original language and ignored later developments, which it sees as decay and decline; it has been concerned with classical literary texts, which are artificial and unnatural, instead of the real, natural speech of living dialects; and so on. Fortunately, however, Brugmann and Osthoff continue, the

Neogrammarian movement has already begun to correct these errors. It has adopted the principles set out by Leskien in his lectures: that language cannot be separated from its speakers as an independent object, and that speakers must have been subject to the same influences in ancient times as operate today. These last two points are clearly aimed at Schleicher, who, as we have seen, treated language as a biological organism with a life of its own, which goes through different phases of birth, aging, and decay.

Brugmann and Osthoff conclude by presenting the two most important principles of the movement:

(1) "Every sound change, inasmuch as it occurs mechanically, takes place according to laws that admit no exception."

(2) "Since it is clear that form association, that is, the creation of new linguistic forms by analogy, plays a very important role in the life of the more recent languages, this type of linguistic innovation is to be recognized without hesitation for older periods too, and even for the oldest."

Most of the points made by Brugmann and Osthoff are uncontroversial today, but they were provocative and problematic at the time. Most controversial was the first of the two principles, the exceptionlessness of sound laws. This principle was also hinted at by Schleicher, though not followed through, and it was also stated by Scherer, but it is the Neogrammarians who adopted it as one of their major axioms and with whom it is associated. The other principle, that of analogy, was even less original and was recognized by many earlier scholars, but again the Neogrammarians elevated it to a major principle, counterbalancing the exceptionless principle: all changes could, in effect, be attributed to one or the other.

Though these two principles are given prominence, many of the other points of Neogrammarian doctrine are also important: the downplaying of the reconstruction of the proto-language in favor of understanding the **processes** of language change, the emphasis on the use of 'real' language, and the recognition of the uniformitarian principle, according to which the processes at work in ancient times are no different from those operative today.

The chief theoretician of the Neogrammarians was Hermann Paul, whose main work, *Prinzipien der Sprachgeschichte* (*Principles of the history of language*), was first published in 1880 and has gone through many editions since. Paul is quite explicit in his insistence that linguistics is a **science**, though a **cultural** and **historical** science rather than a natural one. Indeed, he argues that a scientific approach to language is necessarily historical, because the goal of science is explanation, and only history can explain language:

> "What is explained as a non-historical and yet scientific investigation of language is in fact nothing other than an incompletely historical one .... As soon as one goes beyond the mere observation of details, as soon as one attempts to grasp the context, to comprehend the phenomena, one has stepped onto historical ground."

Paul raises the question of the actual mechanism of language change. He adopts a psychological view, thus taking up Brugmann and Osthoff's complaint that earlier linguists (they had in mind Schleicher) had ignored psychology. The psychological aspects of language change had been discussed by the psychologist Wilhelm Wundt (1832–1920), but in Humboldtian terms, concerned with the psychology of the whole nation – see his later *Völkerpsychologie* (*Psychology of peoples*) of 1900–1920. For Wundt, language change involves a change in the 'collective mind' (*Volksseele*), but Paul stresses the role of **individual** psychology. For him, acts of speech leave behind kinesthetic and auditory impressions in the individual mind which are then recalled in subsequent speech acts, thus ensuring continuity through time but also a degree of variability which gives scope for change. There is also a social dimension, with the existence of a norm brought about through mutual influence among speakers. Change occurs though a shift in these impressions or in the norm, for example through the acquisition of the language by a new generation.

The influence of the Neogrammarians was immense, but they were not without their detractors. The main criticism was directed against the principle of exceptionless sound laws. For the Neogrammarians, this principle was fundamental, because it is the foundation of their claim that linguistics is a **science**. Leskien remarked that:

> "If one admits optional, contingent and unconnected changes, one is basically stating that the object of one's research, language, is not amenable to scientific recognition."

Criticism of this position came from various quarters, and not only the conservative tradition represented by Curtius. Another critic was Hugo Schuchardt (1842–1927), whose article 'Über die Lautgesetze: Gegen die Junggrammatiker' ('On sound laws: against the Neogrammarians') of 1885 argued against Neogrammarian doctrine on two counts: first, that by regarding sound changes as mechanical it excludes the individual speaker, and second, that changes are only without exceptions if we exclude many factors which are part of normal language

development, such as conflicts between different 'laws', and especially dialect mixture.

But the main argument against the exceptionlessness of sound laws came – ironically, in view of the Neogrammarians' championing of dialects as 'real language' – from dialect surveys, which began in the 1880s, with Wenker in Germany and Gilliéron in France. Dialect evidence undermined the much-vaunted regularity of sound changes, because these changes were found to be geographically far from uniform. For example, the isoglosses (boundaries) of different changes involved in the High German Consonant Shift, which created fricatives from earlier plosives, were found to be different for different consonants, and, worse still, the diphthongization of Middle High German vowels was found to have been implemented differently in different words, so that the isogloss for *hu:s* > *haus* was different from that for *bru:n* > *braun* and that for *u:s* > *aus*.

The most consistent criticism of the Neogrammarian position came from Romance linguists. The Romance languages are in a different position from most of the other Indo-European families, and from Proto-Indo-European itself, because the proto-language (Latin) had been preserved, and its evolution into the daughter languages is well-documented. The evidence from Romance dialectology offered many more instances of irregular developments. By the side of the Neogrammarian doctrine that 'sound laws have no exceptions,' we can place the Romance maxim, attributed to Gilliéron, that 'chaque mot a son histoire.'

Conclusion: Fin-de-siècle Linguistics

Although by the end of the 19th century the 'sound law' controversy had run its course, and indeed the Neogrammarian 'movement' had already petered out, the more general issues raised by the controversy – the extent to which language change is a regular process – continued into the 20th century. However, most of the principles of the Neogrammarians, such as their insistence on the scientific status of linguistics and on the necessity for close examination of real language data, were now generally accepted. Brugmann's impressive later work, *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (*Outline of the comparative grammar of the Indo-European languages*), published in five volumes from 1886 to 1900 with a contribution on syntax by Delbrück, exemplified these principles and became the authoritative source of information on its subject. The result of rigorous and consistent application of the comparative method, it stands as the culmination of, and a fitting monument to, a century of historical and comparative linguistic scholarship.

Although the theoretically most important and influential achievements were in the field of the Indo-European languages, the methods were applied to the historical study of other language families. The Semitic languages were well-known, but a comparative grammar was not published until 1890, by William Wright (1830–1889); the vexed question of the unity of the Finno-Ugrian family and its relationship to others (especially the Turkic family) was clarified by Otto Donner (1835–1909) in a paper of 1880, and a comparative grammar of Hungarian was published by József Szinnyei (1857–1943) in 1896. We may also note the important developments in an ancillary discipline which was fundamental to reliable comparison and reconstruction: phonetics. Until the publication in 1876 of Eduard Sievers *Grundzüge der Lautphysiologie zur Einführung in das Studium der Lautlehre der indogermanischen Sprachen,* later more conveniently entitled *Grundzüge der Phonetik* (*Principles of phonetics*), phonetics (at least in continental Europe; in England the subject developed independently) was largely the preserve of physiologists and suffered from some basic weaknesses; the previous standard work, Ernst Brücke's *Grundzüge der Physiologie und Systematik der Sprachlaute für Linguisten und Taubstummenlehrer* (*Principles of the physiology and systematics of speech sounds for linguists and teachers of the deaf and dumb*) of 1856, for example, erroneously treated the post-alveolar fricative [ʃ] represented by German *sch* as a coarticulated alveolar [s] and velar fricative [x].

However, the end of the century also saw the beginnings of a change of approach, and not only in linguistics but also in the natural sciences and in intellectual life generally. The absolutes and certainties of 19th century science were beginning to be undermined by relativism and indeterminacies, and the positivist outlook which had dominated the second half of the century was giving way to a more sceptical approach. Evidence of this trend in linguistics may be seen in such movements as the 'idealist' school of Benedetto Croce (1866–1952) and Karl Vossler (1872–1949). For Croce, language was first and foremost an **esthetic** phenomenon, and language change a **creative** process; Vossler, in his *Positivismus und Idealismus in der Sprachwissenschaft* (*Positivism and idealism in linguistics*) of 1904 sets against the positivist linguistics of the Neogrammarians a new 'idealist' linguistics, based on esthetics, culture, and individual creativity.

But a more serious threat to the fundamentals of 19th century historical and comparative linguistics was already developing. Throughout the century,

and in fact as its main defining characteristic, linguistics had been a **historical** discipline; indeed, as we have seen, Paul explicitly denied that a non-historical approach could be scientific. But the foundations of a non-historical, **synchronic** linguistics had already been laid by the Polish scholar Jan Baudouin de Courtenay (1845–1949), and it was on these foundations that Ferdinand de Saussure was to build in the early 20th century, establishing the primacy of the synchronic dimension. This development was also to mark the end of the German hegemony in linguistics. Thus, 19th century linguistics was to end in the same way that it had begun: with an intellectual revolution. This revolution, though, like the earlier one, was neither sudden nor complete.

Historical Pragmatics

A H Jucker, University of Zurich, Zurich, Switzerland

Introduction

Historical pragmatics is a field of study that lies at the intersection of historical linguistics and pragmatics. It has established itself as an active field of inquiry since the mid-1990s as a result of a broadening of both historical linguistics, which started to replace a view of language as a coherent and homogeneous system by a more corpus-driven approach, focusing on genre-specific conventions and the internal variability of older stages of language, and a simultaneous broadening of pragmatics, which started to accept an increasingly wide range of data, including also written data. As a consequence, historical pragmatics defines itself as the study of pragmatic aspects in the history of specific languages. The field is also called historical discourse analysis or historical dialogue analysis (e.g., Brinton, 2001; Jucker *et al*., 1999). The choice of terms may sometimes imply a specific perspective, but often they are used interchangeably.

Data

Spoken interaction from the past is not directly available for inspection, but this is no longer seen as problematic for historical pragmatics for several reasons. Instances of recorded spoken language abound in historical data. Court records, for example, contain verbatim accounts of the words spoken during the course of legal proceedings in a law court. Plays consist almost entirely of fictional accounts of spoken language. Early scientific textbooks are often written in the form of fictional interactions between a master and a student. Narrative fiction may contain long stretches of reported discourse. And language teaching textbooks often provide model conversations, e.g., for the merchant traveling to a foreign country.

In all instances, the reliability of these data are an issue. Court proceedings were presumably formal and thus not typical of everyday language. Prescriptive models in language textbooks and representations of conversations in drama or fictional narratives cannot be taken as accurate renderings of the spoken language of any particular period. Therefore, on the one hand, these historical records of spoken language may give us an approximation of the real spoken language in different historical and sociocultural contexts; on the other hand, these instances warrant a pragmatic analysis in their own right. Thus, we may analyze the use of discourse markers in a play by Shakespeare, not because we believe that this is a particularly good approximation to how discourse markers were used in spoken conversations of Shakespeare's time, but because we are directly interested in how Shakespeare used discourse markers in his plays. (*see* **Discourse Markers**).

In addition, Koch and Oesterreicher (1985), in a widely adopted model, have argued for a need to distinguish between the realization of language in a particular medium, and the way language is realized on a scale ranging from the language of immediacy to the language of distance. As to the first, language may be realized either in the phonic code or in the graphic code. But this dichotomy has to be distinguished from the scale formed between instances of the language of immediacy, which is more typically (but not exclusively) realized in the phonic code, and the language of distance, which is more typically (but not exclusively) realized in the written code. While no historical language realized in the phonic code is still available, there is sufficient data on the language of immediacy, as for instance in diaries or in personal correspondence.

Moreover, even written texts that lack any connection to the spoken language and that are manifestations of the language of distance are always produced in a communicative context by writers who want to communicate with their readers, and as communicative events they are amenable to pragmatic analyses.

Topics in Historical Pragmatics

Several distinct subfields of historical pragmatics can be distinguished. The first approach, which has been

Introduction

Historical pragmatics is a field of study that lies at the intersection of historical linguistics and pragmatics. It has established itself as an active field of inquiry since the mid-1990s as a result of a broadening of both historical linguistics, which started to replace a view of language as a coherent and homogeneous system by a more corpus-driven approach, focusing on genre-specific conventions and the internal variability of older stages of language, and a simultaneous broadening of pragmatics, which started to accept an increasingly wide range of data, including also written data. As a consequence, historical pragmatics defines itself as the study of pragmatic aspects in the history of specific languages. The field is also called historical discourse analysis or historical dialogue analysis (e.g., Brinton, 2001; Jucker *et al*., 1999). The choice of terms may sometimes imply a specific perspective, but often they are used interchangeably.

Data

Spoken interaction from the past is not directly available for inspection, but this is no longer seen as problematic for historical pragmatics for several reasons. Instances of recorded spoken language abound in historical data. Court records, for example, contain verbatim accounts of the words spoken during the course of legal proceedings in a law court. Plays consist almost entirely of fictional accounts of spoken language. Early scientific textbooks are often written in the form of fictional interactions between a master and a student. Narrative fiction may contain long stretches of reported discourse. And language teaching textbooks often provide model conversations, e.g., for the merchant traveling to a foreign country.

In all instances, the reliability of these data are an issue. Court proceedings were presumably formal and thus not typical of everyday language. Prescriptive models in language textbooks and representations of conversations in drama or fictional narratives cannot be taken as accurate renderings of the spoken language of any particular period. Therefore, on the one hand, these historical records of spoken language may give us an approximation of the real spoken language in different historical and sociocultural contexts; on the other hand, these instances warrant a pragmatic analysis in their own right. Thus, we may analyze the use of discourse markers in a play by Shakespeare, not because we believe that this is a particularly good approximation to how discourse markers were used in spoken conversations of Shakespeare's time, but because we are directly interested in how Shakespeare used discourse markers in his plays. (*see* **Discourse Markers**).

In addition, Koch and Oesterreicher (1985), in a widely adopted model, have argued for a need to distinguish between the realization of language in a particular medium, and the way language is realized on a scale ranging from the language of immediacy to the language of distance. As to the first, language may be realized either in the phonic code or in the graphic code. But this dichotomy has to be distinguished from the scale formed between instances of the language of immediacy, which is more typically (but not exclusively) realized in the phonic code, and the language of distance, which is more typically (but not exclusively) realized in the written code. While no historical language realized in the phonic code is still available, there is sufficient data on the language of immediacy, as for instance in diaries or in personal correspondence.

Moreover, even written texts that lack any connection to the spoken language and that are manifestations of the language of distance are always produced in a communicative context by writers who want to communicate with their readers, and as communicative events they are amenable to pragmatic analyses.

Topics in Historical Pragmatics

Several distinct subfields of historical pragmatics can be distinguished. The first approach, which has been

called 'pragmaphilology' by Jacobs and Jucker (1995), studies pragmatic aspects of historical texts in their sociocultural context of communication. Such studies are not new, except for their more explicit reliance on recently developed descriptive tools from the fields of pragmatics and discourse analysis. These may range from ethnographic descriptions of communicative events to the various forms of politeness attested in historical data and to discourse analytical investigations. They also include an approach that may be termed 'literary historical pragmatics.' Fitzmaurice (2002), for instance, provides a pragmatic reading of familiar letters in 17th- and 18th-century England which takes into account intended and unintended meanings implied and inferred by writer and audience. Sell (2000) deals with literary texts of the past. He argues that literary activity should be seen as communication in a strongly interactive sense, as it is affected by the different situationalities of sender and receiver. In the case of literature, sender and receiver are often separated not only in place but also in time. In this case, the literary critic, or the historical pragmaticist, has the task of mediating between the situationalities.

The second approach, diachronic pragmatics, studies the historical development of pragmatic elements, such as discourse markers or speech acts, or it studies the pragmatic causes of language change. To the extent that different stages in the history of a language are compared, historical pragmatics is a kind of contrastive analysis. As in any contrastive study, it is important to specify the *tertium comparationis*, i.e., the element that remains constant when different diachronic stages are compared. It has become standard to distinguish between 'diachronic form-to-function mapping' and 'diachronic function-to-form mapping' (see Jacobs and Jucker, 1995: 13). An example of the former are discourse markers or pragmatic markers, which are typically marginal forms with little or no propositional meaning that occur outside the syntactic structure and which function on the interactional or pragmatic level. Brinton (1996) examines a variety of such markers in Old English and in Middle English. In this case, linguistic forms that stay relatively stable are taken as a starting point, and their different functions at different stages of their diachronic development are traced.

If, on the other hand, a linguistic function, such as the expression of politeness, is taken as starting point, the term *diachronic function-to-form mapping* is used. In this case, the different realizations of this function in the course of time are studied. Arnovick (1999), for instance, traces the histories of a number of speech acts, such as promises, curses, blessings, greetings, and entire speech events, such as flyting and sounding, which she collectively calls *illocutionary biographies*. Jucker and Taavitsainen (2000) argue that histories of individual speech acts have to be situated within a multidimensional pragmatic space in which the speech act can be contrasted with neighboring speech acts.

Often, however, the distinction between these two perspectives is not easy, because in the course of time a particular linguistic element may change both its form and its function. And in some cases the object of investigation is not a particular form or a particular function but a more comprehensive system of interconnected entities, as in the case of address term systems (see Taavitsainen and Jucker, 2003). Many languages distinguish between a more polite and a more intimate personal pronoun of address, such as French *vous* and *tu* or Early Modern English *you* and *thou*. Some languages have more than just two such pronouns of address (e.g., German at some stage of its development, see Listen, 1999). Such systems undergo multivaried developments at different levels. Busse (2002) investigates the morpho-syntactic variability of the second person pronouns in the plays by William Shakespeare and seeks to identify the factors that influence the choice of *you* versus *thou* and *ye* versus *you*.

The cover term *diachronic pragmatics* is also used for approaches that study the pragmatic causes of language change. Traugott and Dasher (2002), for instance, argue on the basis of extensive corpus data from English and Japanese that there are predictable paths of semantic change because such changes are pragmatically motivated, that is to say they are bound up with mechanisms called *invited inferencing* and *subjectification*.

Recent Advances

To date, a disproportionate amount of research in historical pragmatics is devoted to the history of English, but important work has been carried out in several other and less-well researched languages. Xing (2004), for instance, investigates the pragmatic factors affecting the development of a specific focus particle in Mandarin Chinese. Lunde (2004) examines reporting strategies in medieval East Slavic hagiography and homiletics, and Collins's (2001) study is devoted to the distribution of reporting strategies in a corpus of medieval Russian texts.

The papers published by Bax (2003) testify to the importance of rituals in language change in diverse language situations, ranging from ancient Indo-European religious poetry (Vedic hymns) to ritual politeness in early modern Dutch letter writing and ritual aspects of contemporary mass sports events. The language of the mass media has also received

increasing attention from historical pragmaticists, for instance in the papers published by Ungerer (2000) and by Herring (2003), which provide an historical view on mass media communication, and thus show that historical pragmatic analyses can also be applied to changes in progress.

Ziegeler D (2001). 'Past ability modality and the derivation of complementary inferences.' *Journal of Historical Pragmatics 2.2*, 273–316.

been sufficiently synthesized and methodologically developed by the generation of Georg Curtius (1820–1885) and, especially, August Schleicher (1821–1868), to the extent that one might speak of a 'paradigm' change having taken place at that time, of which the Neogrammarian tenets of historical linguistic research associated with the names of their former students, notably Karl Brugmann (1849–1919) and August Leskien (1840–1916), respectively, were the logical, if somewhat overstated, outcome.

A similar observation of the motives of history writing, it would seem, could be made about Holger Pedersen's (1867–1953) 1924 history of the achievements of 19th-century Indo-Europeanists, which was preceded by a similar and somewhat shorter account of his first published history in 1916, the year of the completion of Brugmann's second edition (and only in its first edition it was also Delbrück's) *Grundriss der vergleichenden grammatik der indogermanischen sprachen,* as well as the appearance of Saussure's posthumous *Cours de linguistique générale*. The need of such a summing up of history is expressed more clearly, perhaps, in Wilhelm Streitberg's (1864–1925) voluminous undertaking, entitled *Geschichte der indogermanischen sprachwissenschaft seit ihrer begründung durch Franz Bopp*. However, this is more of a stock-taking of the work accomplished in the various branches of Indo-European philology by that time than a regular 'History of Linguistics' (cf. Koerner, 1978a: 16–17, for details). Begun in 1916, the enterprise was abandoned after 1936.

After World War II, it appears that the histories by Malmberg (1964 [1959]), Iviç (1965 [1963]), Leroy (1963), and others, fulfilled a similar function of summing up previous attainments in linguistic science. However, this time the focus of attention was the post–1916 period in the history of linguistics, following the success story of Saussure's *Cours*, with its perceived emphasis on a nonhistorical approach to language. The Neogrammarian framework of linguistic research was propounded in the histories of Pedersen, the organizational efforts of Streitberg from 1916 onward, and other less influential books – and one may add that Pedersen, a second-generation Neogrammarian, reflects the positivist orientation of that school much more emphatically than the original group of scholars (note that neither Delbrück's *Einleitung* nor Paul's *Prinzipien* are even mentioned in his 300-page study of 1931 [1924]). Only in more recent years (e.g., Einhauser, 1990; Morpurgo Davies, 1999: 226–278) have the Neogrammarians received a more adequate treatment. By the same token, the histories by Malmberg, Iviç, Leroy, and other similarly slanted studies of the 1960s, put forward particular post-Saussurean trends as the most significant achievements of the discipline to date, whether Copenhagen-type, Praguean, or Bloomfieldian. Their endeavor, like that of Benfey, Raumer, Pedersen, Streitberg, and others from an earlier stage in the development of linguistics, was to a large extent the presentation of a framework of research in which they themselves had been brought up, and, concomitantly, an attempt to maintain the strength and impact of the structuralist mode of thought.

Celebratory or Propagandistic Histories of Linguistics

The second type of history writing activity may be characterized by the intention on the part of an individual usually in his thirties (not late forties or well above, as is generally the case with the first type: Benfey was sixty when his book appeared), again representing a particular group, to launch a campaign opposing previously cherished views and still prevailing doctrines. Thus in contrast to Benfey (1869), for example, Berthold Delbrück's (1842–1922) 1880 *Einleitung* (6th and last edition, 1919) served, together with Paul's *Prinzipien* of the same year (5th and last edition, 1920), to speak for a new generation of scholars eager to demonstrate that their achievements significantly surpassed previous attainments in the field, and that their theories rightfully replaced those taught by the preceding generation of linguists. The claim in favor of discontinuity is what characterizes this type of activity, and Delbrück's book is a prime example of this effort. Typically, Schleicher was depicted by Delbrück (1882: 55) as representing the conclusion of the phase of comparative-historical grammar inaugurated by Franz Bopp in 1816, and the *Junggrammatiker*, with whom he associated himself early in his career (soon after he had received Schleicher's chair at the University of Jena in 1873), as marking a decisive new turn in the field.

No comparable history of linguistics was written in the 1930s or 1940s with regard to structuralism, but a look into Bloomfield's *Language* (1933: 3–20) or Louis Herbert Gray's (1875–1955) *Foundations of language* (1939: 419–460) clearly suggests that the chapters devoted to the history of linguistics were an attempt to redress the development of the discipline and to document the superiority of the structuralist approach to any other theory or method hitherto put forward. This endeavor to prove earlier views to be insufficient and inadequate has by no means been abandoned by adherents of the prevailing modes of linguistic thinking of today. On the contrary, it can easily be shown that their advocates have been eager

not only to revive an interest in the history of linguistics itself but also to rewrite it to such an extent that the ideas of the generation immediately preceding the present one appear the least worthy of attention. As a matter of fact, what C. F. Voegelin in 1963 felicitously termed the 'eclipsing stance' that transformational-generative grammar had embarked on was best illustrated by Noam Chomsky himself, for instance in his lecture at the Cambridge, Massachusetts Congress of Linguists of 1962 (Chomsky, 1964). Soon thereafter, a number of his followers ardently engaged themselves in writing their particular view of history; compare the articles by Dingwall (1963), Bach (1965), or Bierwisch (1966). More recently, in 1980, Frederick Newmeyer published a book that constitutes the best example to date of this *pro-domo*, whiggish type of history writing. It selects and reinterprets past linguistic research in an attempt to prove his view that linguistics was made a science only in 1955 or in 1957, and by Chomsky, and that previous work was totally inadequate, barring a few minor incidental insights foreshadowing the 'revolution' in the field (cf. Koerner, 1983 and, more recently, 2002: Chap. 8, for a critical assessment of this kind of activity).

While Type I, i.e., the summing-up type, of history writing may appear more benign as it seems to represent matter-of-fact accounts (though one should not be too sure about this), Type II History of Linguistics can best be described as propagandistic in nature; the most successful example of this type is Chomsky's own *Cartesian linguistics* of 1966. This book presents the author's views regarding the ancestry of his own theories so brilliantly that many a young student of language was carried away by this new vision of history. Today, we can still discover a considerable amount of useful information in the histories written for the purpose of summing up previous work in the field, *viz*. the accounts by Benfey, Raumer, Pedersen, and others – although we may have become quite aware of their biases and shortcomings (for an assessment of these works, cf. Hoenigswald, 1986 and Koerner, 1990) – whereas histories of the second category, though written much more recently, are already dated. It appears that, once their propagandistic purpose has been satisfied in proselytizing for the new ideology, these works rapidly lose their initial impact and informational worth. After the publication of the second edition of *Language and mind* (Chomsky, 1972), we rarely see any historical references in his work, barring those to the ideas of Saussure and Jespersen (cf. Koerner, 1994). More recent comments on the subject (Chomksy, 1997a and 1997b) cannot be taken seriously and have been criticized accordingly in Joseph (1999).

Detached Histories of Linguistics (Problemgeschichte)

There is possibly a third type of the history of linguistics that is intended neither to advocate a particular framework or 'paradigm' nor to attempt to provide an argument in favor of a scientific revolution within the discipline. This type may occur at any time in the development of a particular field of research since its ultimate intent is less partisan than in the other two instances and often more holistic in attitude, though the motivation behind the work may be fairly personal. To my mind, the best example is Arens's 1955 *Sprachwissenschaft* (2nd enlarged ed., 1969), in which an attempt was made to delineate the development of Western linguistic thought from the early discussions of the Greeks about the nature of language to contemporary linguistic work, certainly with a view to indicating not only that our discipline has come a long way to gain those insights we now cherish and the methods we have developed, but also that we all have built, knowingly or not, upon the findings of previous generations of linguists, and that we owe much more to these scholars than we might ever become fully aware of.

While this Type III manner of presenting the history of linguistics might well have been the result of an individual choice, it appears that it still expressed the endeavor of a whole generation of scholars, namely, the rebuilding of a discipline after its almost total destruction after a world war. Taken in this way, Pedersen's 1931 book may well be included in the third category in that it sought to reestablish a linguistic tradition that in his belief should have continued to serve as a sound basis for subsequent work in the field of comparative-historical linguistics after World War I. But Pedersen's view of linguistics is such that his accounting cannot be compared to Arens's much more detached view of the evolution of linguistics during the 19th and the early 20th centuries.

Undoubtedly, other, often nonlinguistic, motives played a role in presenting the history of the discipline in one way or another. Thus it should be recalled that particular socioeconomic conditions, historical events, or political situations have often had a considerable influence on the motivation of writing the history of a particular discipline or the acceptance of a seemingly new theoretical framework of research or mode of thought – and, in this respect, histories of linguistics have failed to increase our awareness of the impact of matters or events outside the field. The works of Benfey and Raumer, for instance, were highly motivated by the rise of German nationalism (as

their prefaces suggest) and the aspiration to national unity, if not superiority, of Germany among the European powers. That such sentiments may well have played a role when after World War I German linguistic science did no longer hold sway in many parts of the world was pointed out by Malkiel (1969: 557) who observed that the success of Saussure's *Cours* "cannot be properly measured without some allowance for the feelings of that time: The acceptance of the leadership of a French-Swiss genius connoted for many Westerners then opposed to Germany a strongly desired, rationalized escape from the world of Brugmann, Leskien, Osthoff, and Paul."

Historiography of Linguistics

Despite the respect scholars may have for works of the third type, as exemplified by Arens's *Problemgeschichte*, some have felt a need for yet a fourth type of history writing (cf. Koerner, 1976 [1972] and Simone, 1975 [1973] for early expressions of this sentiment), namely, the presentation of our linguistic past as an integral part of the discipline itself and, at the same time, as an activity founded on well-defined principles which can rival, in terms of soundness of method and rigor of application, those of linguistics itself. This fourth type, now usually referred to as 'linguistic historiography' or, more properly, the 'historiography of linguistics' demands that the history of linguistics should not be merely subservient to the discipline, but should assume a function comparable to that of the history of science for the natural scientist. In short, while recognizing the important distinction between chronicle and history, recent contributors to the history of linguistics have gone a step further by distinguishing between history and historiography. This is partly an attempt to make clear a departure from previous work in the field, which only too often tended to be partisan–histories, or what Henry Butterfield termed 'Whig-histories,' and partly because previous histories did not provide a usable guide for the adequate treatment of past developments in the history of the language sciences, and thus failed to offer a better understanding of where current theories may lead us to.

The 1980s saw a variety of studies offering alternative lines of historiographic conduct, entering the debate over the proper approach to the history of linguistics, and suggesting ways that would lead to more adequacy of treatment (e.g., Schmitter, 1982; Grotsch, 1982; Christmann, 1987). However, no common ground has yet been established as to how to proceed in linguistic historiography, and indications are that the debate will continue for some time. Maybe this is a healthy sign.

Mid-Century Efforts in the History of Linguistics

New publications and, at times, a few insightful studies in the history of linguistics appeared in the 1960s, perhaps beginning with Paul Diderichsen's (1905–1964) work of 1960 on his compatriot Rasmus Rask (German translation, 1976). It was followed by works such as Iviç (1963; English translation, 1965), Leroy (1963; English translation, 1967), Tagliavini (1963), Malmberg (1964), Lepschy (1966; English translation, 1970), Mounin (1967), Robins (1967), Coseriu (1969, 1972), Helbig (1970), Szemerényi (1971), Jankowsky (1972), and others (see Koerner, 1978a for a full list down to 1976). Yet most of them relied uncritically on earlier accounts and rarely ventured into questions of historiographical method or touched upon matters concerning the philosophy of science, except perhaps for a fashionable nod in the direction of Thomas Kuhn's *Structure of scientific revolutions* of 1962. Most of these books are largely forgotten now, and are at times cited for criticism. Many of them had been produced following Chomsky's 'big splash' with his 1962 plenary lecture at the Ninth International Congress of Linguists held in Cambridge, Massachusetts (Chomsky, 1964), at which he first referred to his newly discovered ancestors. These works were following the fad of the day. Among the books of this period R. H. Robins' *Short history* of 1967 has shown the greatest 'staying power.' I think that part of the popularity was because it was the only one written by a native speaker of English, and so it stood aloof from any criticism of Chomsky's work, including the latter's incursions into the history of linguistics, and it was of a size that made it handy as a textbook. Like all the others of the time, its elegant narrative cannot disguise its scholarly flaws. I believe we have learned enough about the complexity of the subject that no reasonable person today will venture to undertake a similar attempt at covering 2500 years of Western history of linguistics in barely 200 pages. The late Bertil Malmberg's attempt of 1991 is most charitably described as an *Alterswerk*, the work of someone too old to read the signs of the times, not to mention the scholarship of the preceding twenty or more years. Such a work, based on little original research, rightly belongs to the 1960s. (Somewhat more successful in this regard was Swiggers's 1997 effort, done by a scholar born some 40 years later.)

Still, as far as individual scholarship is concerned, concentration on a particular subject instead of attempting to cover too much ground and too many centuries of development, has been more promising, e.g., Robins's rehabilitation of the Byzantine

grammarians (1993), Morpurgo Davies's monograph on 19th-century historical-comparative linguistics (1999), Graffi's survey of 19th- and 20th-century work in syntax (2000), or Coseriu and Meisterfeld's first part of a history of Romance linguistics (2003).

The More Recent Study of the History of Linguistics

During the 1960s, following various claims made by Chomsky that his own theories had little to do with the pursuits of his immediate predecessors and contemporaries, but instead follow quite different traditions such as those associated with the Port Royal grammarians and the work of Wilhelm von Humboldt, the bulk of the dissertations written on the history of linguistics were devoted to just these areas of interest, at times seriously distorting the true intent and purpose of these earlier authors. For instance, Sanctius's *Minerva* was studied because of a recent revival of interest on the part of generativists in the phenomenon of ellipsis, a subject to which Sanctius had made an important contribution (cf. Breva Claramonte, 1983).

Only from the 1970s onward – and quite independent of Chomsky's *Cartesian linguistics*, I may add – following the creation of the first journal for this particular field of interest in 1973, *Historiographia linguistica*, and various associated monograph series united under the umbrella title 'Amsterdam Studies in the Theory and History of Linguistic Science,' did serious work begin to emerge that challenged this *pro-domo* type of history writing. These and other organized activities (see below) led to the much more recent field of study, now generally referred to as the 'historiography of linguistics' (see Koerner, 1995a) or 'linguistic historiography' for short, an approach to the history of linguistics which is conscious of methodological and epistemological requirements in adequate history writing in linguistics as in any other discipline. (See under 'Remaining challenges in linguistic historiography' for the result of more recent decades.)

The Consolidation of Linguistic Historiography

Another indication of the history of linguistics having become a mature field of scholarly pursuit is its general professionalization. In 1978, the first International Conference on the History of the Language Sciences (ICHoLS) was held in Ottawa, Canada, the same year in which the Société d'Histoire et d'Épistémologie des Sciences du Langage (S.H.E.S.L.) was founded in Paris. In 1984, the Henry Sweet Society for the History of Linguistic Ideas (HSS) was established at Oxford, and several similar international and regional societies have been launched since; for instance, the Dutch society 'Geschiedenis van de Taalwetenschap' (Amsterdam) and the German 'Arbeitskreis *Geschichte der Sprachwissenschaft*' (Münster). Soon thereafter the North American Association for the History of the Language Sciences (NAAHoLS) was created late in 1987, followed by the establishment of the historically oriented Società di Filosofia del Linguaggio (SFL) in 1994 and the Sociedad Española de Historiografía Lingüística (SEHL) in 1995. Even outside Europe, the later 1990s saw the creations of history of linguistics societies launched in São Paulo and in Mexico City, for example. These associations and various others have organized and are organizing scholarly meetings, both national and international, and several of them on a regular basis, with participants from many countries in attendance.

In the meantime, further ICHoLS meetings have been held on a triennial basis: in 1981 (Lille, France), 1984 (Princeton, NJ), 1987 (Trier, Germany), 1990 (Galway, Ireland), 1993 (Washington, DC), 1996 (Oxford), 1999 (Fontenay near Paris), and 2002 (São Paulo), with the tenth congress scheduled to take place at the University of Illinois in August 2005. These ICHoLS meetings have regularly drawn over 100 participants from some 20 different countries and have proved useful in providing a liaison between the various members of the national or regional societies. Since its inception, proceedings of ICHoLS have been published on a regular basis, and so, they may reflect the progress that has been made in the field in general terms (cf. Koerner, 1980; Aarsleff *et al.*, 1987; Niederehe & Koerner, 1990; Ahlqvist, 1992; Jankowsky, 1995; Cram *et al.*, 1999; Auroux *et al.*, 2003).

Apart from supplying fora for direct, viva voce exchanges on a wider scale, we should not forget the importance of specialist periodicals and monograph series which provide outlets for research in the discipline. In addition to *Historiographia linguistica*, a second journal with similar goals, entitled *Histoire – Épistémologie – Langage*, was established in Paris in 1979, and more recently in 1991, a third journal, *Beiträge zur geschichte der sprachwissenschaft*, was launched in Münster, Germany. In short, if the professionalization of the subject is any guide, the history of linguistics has become a widely recognized and practiced field of scholarly research. And where monographs in the history of linguistics are concerned, everyone will agree that their number has been steadily increasing; a look at the 'Publications Received'

rubric of *Historiographia linguistica* illustrates this development very well.

In his 1978 foreword to the first collection of my papers, R. H. Robins identified three "types of writing required in the history of linguistics," apart from the "most primary stage of research," namely, the editing and publication of previously unedited texts. This latter kind of work has been done in various places, for instance, in the 'Grammatica Speculativa' series published by Frommann-Holzboog of Stuttgart (more recently, Kelly, 1996), and there are many others. These three 'types' are according to Robins (in Koerner, 1978b: xii–xiii):

1. General theoretical and methodological essays on the historiography of linguistics: what should the history of an academic discipline such as linguistics set out to achieve and how should it be undertaken for this purpose? Opinions, of course, differ on both these questions; a case in point is the applicability or nonapplicability of the Kuhnian concept of a scientific paradigm to the history of linguistic science.
2. Studies more restricted in their time and place, devoted to particular trends and movements of thought on language and the development of particular linguistic concepts.
3. Biographical accounts of the work of individual scholars who have been influential in the course taken by linguistic science during some part of its history.

Those familiar with my efforts in the history of linguistics over the past 30 and more years may agree that I have attempted to contribute in all three areas. Whether I was particularly successful in doing so is up to others to judge. But I think jointly, in many places of the world, including various countries not mentioned in the present account, we can surely state that all these three – if not four, including the editing of hitherto unpublished texts – types of historiographical work has been widely achieved.

This may be a quick *tour d'horizon* of our field, always speaking in general terms and not making particular claims about research in the various specialist areas of individual researchers, be it the Spanish Siglo de Oro, the 17th century in Britain, *le siècle des Lumières*, the early Middle Ages, the Classical or any other period, whether in the Western tradition or not. I may lay claim to only some knowledge in 19th- and 20th-century European and North American linguistics (e.g., Koerner, 2002), and usually do not venture much outside this territory. I believe all present-day historiographers are agreed now that effective research even in areas such as the classics (e.g., Taylor, 1987), the early or the late medieval period (e.g., Law, 1993 and Ebbesen, 1995, respectively), or any other period in the history of linguistic thought are best pursued by a team of specialists, not scholars working alone.

Remaining Challenges in Linguistic Historiography

Despite all the achievements referred to so far – and I know that I have barely touched the surface of what has actually been done in the historiography of linguistics, especially over the past 10 or more years – I do not think that there is much reason to be smug. I feel, although I know that I must leave it largely to the next generation to ensure continuity and quality of research in the field, that we must remain vigilant and not become self-indulgent, and remember that the history of linguistics should remain an integral part of the language sciences and not become a separate department, either organizationally or philosophically. In general, we should heed Raffaele Simone's recent observation "Purus historicus est asinus" (Simone, 1995; cf. also Koerner, 2003).

On the practical side, we still have to see the various multivolume histories – Schmitter (1987–), Auroux (1989–1992, 2000), Lepschy (1994 [1990]–1998) – come to completion, notably what I am inclined to call the *Jahrhundertwerk* in our field, namely, the trilingual *History of the language sciences / Histoire des sciences du langage / Geschichte der sprachwissenschaften* edited by myself, together with Hans-Josef Niederehe, Kees Versteegh, and Sylvain Auroux, which will be completed in 2005. The editors and about 250 individual contributors have been working quite conscientiously on making this first 'world history of the language sciences' a reality. Until then – as there are indications that the historical surveys edited by Auroux, Lepschy, and possibly Schmitter as well do not venture much beyond the advent of Saussurean linguistics – the *Concise history of the language sciences: From the Sumerians to the cognitivists,* edited by Ron Asher and myself, will have to serve the needs of those interested in the most recent history of linguistics (Koerner and Asher, 1995: 221–368).

But there are other concerns too. I do not think that the worries recently expressed by Frederick Newmeyer in his 1996 collection of papers on the history of generativism in North America need of necessity apply to us, but the suspicion is lurking that part of these might. In his introduction he reported that many of his colleagues "feared that [he] would become tarred with the brush of being an 'historian of linguistics', who, [...], occupy a status level even lower than that of a 'semiotician'" (p. 2). Newmeyer

further explained "That this attitude results from the belief that most people who write on the history of linguistics have only the most minimal training in modern linguistics and devote their careers to attempting to demonstrate that their pet medieval grammarian or philosopher thought up some technical term before somebody else's pet medieval grammarian or philosopher." I don't believe that we must take this apparent caricature too seriously. On one point at least I am in agreement with Newmeyer, namely, that a historian of linguistics should also be a linguist. This may not apply with the same stringency to pre–19th-century linguistics (although not only in 'modern,' i.e., generative linguistics), but I cannot imagine anyone making sense of the work of Pānini, for instance, who is not thoroughly trained as a grammarian of Sanskrit. Still, others have more recently voiced concern about the status of linguistic historiography and its impact on linguistics proper (Schreyer, 2000; Schmitter, 2003a), concerns that deserve to be addressed (Koerner, 2005b).

There are other issues – apart of the continuing battle for legitimatization and institutional support – of linguistic historiography – which I remain concerned about. They pertain to questions of methodology and epistemology, but also of what may be called 'quality control' (cf. Koerner, 2005b). I have addressed a number of these methodological issues in papers devoted to the concept of 'metalanguage' (see chapters in Koerner, 1989 and 1995b), the often careless argument of 'influence' (e.g., Koerner, 1987), and other issues, attempting a summary of the potential problems of disagreement on questions of method at the 1993 ICHoLS Conference (Koerner, 1995a). It seems to me that a broader consensus on these would be desirable for the further development of the craft, but it requires the will of the scholarly community to meet those challenges head on (cf. Koerner, 2005a, for a more detailed study). An important subject in linguistic historiography that requires more attention than it has received is the issue of ideology in linguistic argumentation (e.g., Koerner, 2000, 2001, 2004a). It seems to me that a broader consensus on, or at least a wider awareness of, these important subjects would be desirable in the further development of the craft, and not just with regard to linguistics in the Third Reich (see, e.g., Hutton, 1999; Hausmann, 2000; Knobloch, 2004).

History of Linguistics: Discipline of Linguistics

N Smith, University College London, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Introduction

Language makes us human.

Whatever we do, language is central to our lives, and the use of language underpins the study of every other discipline. Understanding language gives us insight into ourselves and a tool for the investigation of the rest of the universe. Martians and dolphins, bonobos and bees, may be just as intelligent, cute, adept at social organization, and morally worthwhile, but they don't share our language, they don't speak 'human'. Linguistics, the scientific study of language, seeks to describe and explain this human faculty. It is concerned with three things: discovering precisely what it means to 'know a language'; providing techniques for describing this knowledge; and explaining why our knowledge takes the form it does.

These concerns may seem too obvious to need discussing, but the complexity of our knowledge of language becomes strikingly apparent when we see someone lose their language after they have had a stroke, or when we observe an infant who has yet to acquire the faculty that we deploy so easily. To understand these three concerns, we need a theory, and that is what linguistics provides.

The Meaning of 'Language'

That linguistics is 'the scientific study of language' has become a cliché, but what it means to be 'scientific' may not always be obvious, and what people mean when they use the word 'language' varies from occasion to occasion. Consideration of what is involved in being scientific is deferred until later in the essay, for now it suffices to observe that only a few aspects of language have been illuminated by theoretical (scientific) linguistics, so there are many areas where it has little, if anything, helpful to say. The situation is akin to that in biology, viewed as the science of living things. Despite their importance to us, biology has nothing to say about the definition of pets; similarly, despite their relevance to us, linguistics has nothing to say about the definition of dialects.

In everyday usage, 'language' is used differently, depending on whether it is construed as a property of the individual, of society, of the species, or as an autonomous entity in the world. Linguists working in the tradition of 'generative' grammar, the framework that has dominated linguistics for the last 50 years, argue that an 'individual' approach to language is logically prior to any other, but in principle we have the possible domains shown in (1), each suggesting different kinds of questions:

(1) Language and the Individual
Language and the Brain
Language and Society
Language and the Species
Language and Literature
Language and the World

Looking at 'Language and the Individual', the central question raised is 'what constitutes our "knowledge of language"?' What properties or attributes does one have to have to be correctly described

History of Linguistics in Central and South America

O Zwartjes, Universiteit van Amsterdam, Amsterdam, The Netherlands

© 2006 Elsevier Ltd. All rights reserved.

Spanish and Portuguese missionaries dedicated themselves to the study of non-Indo-European languages, resulting in the publication of a great number of works in or about the Amerindian languages. Although missionaries based and structured their works in agreement with the traditional Greco-Latin grammatical framework, they were forced by the linguistic facts to search for unconventional solutions in their descriptions, which never had been studied before in Europe. There is no doubt that their approaches were in many cases original and creative on all subdisciplines of grammar: phonology; orthography (the rendering of sounds never heard or written before); morphology–morphosyntax (their model predated ours, not yet elaborated, used to describe phenomena such as agglutination, incorporation, different word structure, processes of derivation, and composition in typologically different languages); syntax (e.g., topicalization, ergativity, different word order, the dichotomy active and nonactive, incorporation); and lexicography – another challenge for the missionaries and an important tool for the translation of religious texts.

Missionary works are important sources for other subdisciplines of linguistics, such as sociolinguistics (language variety, language change, standardization), pragmatics, translation theories, cultural anthropology; for reasons of space these will not be treated in this article. Descriptive linguistics always requires an underlying theoretical framework and reflects the linguistic thinking of the period in question. Interest in

missionary linguistics is increasing after a long period of silence and neglect of the many achievements of these premodern linguists (Zimmermann, 1997; Zwartjes, 2000; Zwartjes and Hovdhaugen, 2004). Following is a selection of the most important contributions to the history of language sciences in Central and South America.

Phonology, Orthography

It has been frequently observed that missionary grammars were deficient in their treatment of phonology. Writing of Mesoamerican languages, Suárez (1983: 4) observed that "friars coped rather well with simple systems like that of the Nahuatl, and even with those of moderate complexity in the consonants. However, rich vowel systems such as those found in Otomian and Chinantecan languages were markedly underdifferentiated, and tones were at most dimly recognized but in no case marked in orthography." This may be true if we compare the achievements and shortcomings of grammars of phonologically complex languages such as Otomi or Chinantec with completely innovative descriptions of other tonal languages in Asia such as Mandarin Chinese or Vietnamese by the Dominican Varo and the Jesuit de Rhodes. The latter devised a Roman-based orthography that contains a complex system of diacritic marks that is still in use today, although in a more sophisticated form. The tonal system of the Otomanguean family has never been described in a satisfactory way. Cárceres (1580), Neve y Molina (1767), and Alvarado (1962) did not distinguish clearly between sound, phoneme, and grapheme, as did all their colleagues in that period, and it is only in recent times that we find satisfactory descriptions of the tonal system. Nevertheless, some missionaries were aware of the tonal phenomena (Alvarado, 1962; Reyes, 1976). As Smith Stark (forthcoming) concluded, missionaries "showed ability to arrive at phonologically correct appraisals of the phonetic data. They appreciated the contrastive function of sounds and justified their analyses with minimal pairs. They engaged in a bit of phonological argumentation and included phonotactic information. The work of the Franciscan Olmos (1993) on Nahuatl, Gilberti (1987) and Lagunas (1983) on Purepecha and Cárceres (1907) on Otomi, and the Jesuits Rincón (1967) and Carochi (1983) on Nahuatl in particular stand out for their descriptive acumen." Of course, as Stark admits, "there are also many cases of *underdifferentiation*, as well as of *overdifferentiation* and of what might be called *displacement*." One of the main achievements of missionaries in New Spain are their descriptions of phonological features, with which they were unfamiliar, such as aspiration, glottalization, (*saltillo* 'the little jump, or glottal stop), more complex vowel quality, and contrastive vowel length. The attention to these features and their attempts to describe them are important contributions to the historiography of linguistics. The introduction of new letters demonstrates that sounds had to be graphically differentiated. One of the most illustrative examples are the new signs, *tresillos* and *cuatrillos*, in the grammars of Quiché and other languages of the Maya family, developed by the Franciscan de Parra in the middle of the 16th century.

In Hispanic South America the Roman alphabet was adapted by using diacritics, introducing new symbols, or combining existing symbols. The most creative solutions can be found in the grammars of Muisca (Lugo, 1978), Guarani (Ruiz de Montoya, 1994), Aymara (Bertonio, 1603), Mochica (Carrera, 1644) and Mapuche (Valdivia, 1606). According to the final conclusions of Calvo's article (forthcoming), the evaluation of the analysis of orthographic conventions and descriptive techniques is positive. Missionary linguists established the foundations of the study of many different Amerindian languages.

When comparing the solutions found in the chapters on orthography and phonology we can conclude that this was less developed in Brazil then in Hispanic America, and also compared to the Portuguese grammars in Asia, particularly the detailed analysis of sounds and letters in Japanese by Rodrigues and the impact the Portuguese missionaries have had on descriptions of Vietnamese. In Portuguese America, the most detailed description of the main characteristics of Tupinambá morphophonology has been realized by the pioneer Anchieta (1990); Figueira (1878) paid less attention to this subject, just as Mamiani did in his Kiriri grammar (1877).

Morphology, Morphosyntax

In missionary grammars of Mesoamerica, as in those of other continents in that period, the word (*dictio*) was the minimal meaning-bearing entity and a morpheme-like concept was still unknown. Nevertheless, missionaries often attempted to separate and define smaller entities between the word itself, introducing or redefining a great scala of innovative terms, particularly for the agglutinated suffixes, personal prefixes, infixes, etc. Some examples are: *particulas* (Gilberti, 1987), *semipronombre* (Rincón, 1967), *interposición* (Lagunas, 1983). Others preferred to use terms from the Hebrew tradition, such as 'affixo' (Molina, 1945; Carochi, 1983) or terms inherited from the Latin tradition, such as *silábica adjeción* (Reyes, 1976, probably inspired by Priscian). One of the most innovative aspects on the field of

morphology in Mesoamerica is the description of the phenomenon of 'incorporation' (Rincón, 1967; Carochi, 1983).

In Hispanic South America we find comparable attempts to classify smaller entities of the word (*dictio*). An illustrative example is the grammar of Aymara of Bertonio, where a specific metalanguage is developed for several particles, such as the *particulas generaliter symbolas, particulas particulariter symbolas,* and *particulas dyssymbolas*. Another innovation is the introduction of the term *transición*, the personal reference markers of subject and object within the verb, which can be found in the Jesuit grammars of the Andes, particularly in the Quechua grammar of González Holguín and the Mapudungun grammar of Valdivia. In the grammar of Achagua, we find the so-called *pronombres iniciales*, which is used for the personal prefixes (Neira and Ribero, 1928). A great scala of idiosyncrasies of Amerindian languages are described, such as the dual in Mapudungun (Valdivia, 1606), the first person plural inclusive versus exclusive in Tupinambá (Anchieta, 1990), Guarani (Ruiz de Montoya, 1994), as in the grammars of Quechua. It is illustrative that Latin was not always the model, because sometimes Spanish took over this role – the introduction of the term 'romances,' particularly used for periphrastical constructions, illustrates this strategy, whereas in other cases missionaries expanded the Greco-Latin paradigms. Valdivia recognized that the paradigm of the Mapudungun verb was richer and 'even more elegant' than the Latin verb, and this explains why he introduced the 'mixed tenses.'

It was a great challenge for the grammarians in Portuguese America to describe languages (Tupinambá and Kiriri) that do not share the same features of inflection known from Indo-European languages. According to Anchieta (1990) and Mamiani (1877), modes and tenses are not morphologically distinguished. Mamiani explained that they are distinguished by 'artigos.' In Tupi there are neither definite nor indefinite articles, so missionaries began right from the beginning to use the term 'artigo,' which became redundant, for other purposes. Since the pronominal system in Tupi is totally different from the traditional romance and Greco-Latin system, missionaries differentiated between several categories. According to Figueira, the first class of 'artigos' are combined with 'neutral verbs' (intransitive) and the second class (pronouns) cooccur with 'many active' verbs (transitive). In the Kiriri grammar of Mamiani, the 'artigo' also plays a central part in the paradigms as a 'declension marker,' as happened in the Portuguese grammars of Japanese of the Jesuits.

Syntax

Syntax was not the major concern of missionaries. Some authors in Mesoamerica (Rincón, 1967) even maintained that 'syntax' was nonexistent in Nahuatl, since features of an inflected language (agreement) were not recorded in this indigenous language. Nevertheless, much information related to morphosyntax and syntax can be found in the chapters on morphology. Although this is not the rule, grammatical functions such as 'subject,' 'predicate,' and 'object' are sometimes described. In most grammars, the traditional subjects of syntax, i.e., agreement, government, and word order, play a central part, and it is interesting that the section on syntax in the Brazilian grammars was almost absent in Anchieta's grammar, whereas his followers dedicated more paragraphs to this subject.

Novices from the old world were enabled to learn the grammar with texts. In the last section of a great number of grammars texts are appended, sometimes accompanied with translation theories, observations about stylistics, dialogues were included and even religious (monolingual or bilingual) texts. These texts are important sources since in many cases they are the only surviving records of extinct languages or dialects.

Lexicography and other relevant subjects for linguistic theory

The most important compilations, just to mention some of them, are the dictionaries of Nahuatl (Molina, 1945), Quechua (González Holguín, 1975), Guarani (Ruiz de Montoya, 1994) and Aymara (Bertonio, 1603). These authors used the lexicographical work of Antonio de Nebrija as their model and adapted it to the new world. These sources offer us many details related to the indigenous cultures and reveal the translation strategies of the missionaries in their attempts to render Christian terms in the indigenous languages. Lexicography in the Portuguese tradition is particularly important in Asia, and was much less developed in Brazil, although some 18th-century dictionaries of the 'Língua geral amazônica' have survived.

Hittite is the name now given – its users probably called it Nesite – to the Indo–European language employed in the north-central area of Anatolia (modern Turkey) during much of the second millennium B.C. Large numbers of texts have been excavated, principally at the site of Boğazköy (Boğazkale), the ancient Hattusas, capital of the Hittite kingdom. As evidence for the language comes entirely from documentary sources, the number of speakers cannot be estimated; but it is probable that it was also the spoken vernacular of the area, at least from ca. 1700 to ca. 1300 B.C. During that period, it shows normal signs of linguistic change, but there is evidence, in the absence of continued change and in the increasing presence in the texts of forms which are Luwian in origin, to suggest that after ca. 1300 B.C it had become a 'dead' language, its use confined to the Hittite chancellery, and that its more southerly relative replaced it as a vernacular.

Phonology

Hittite is written in a local variety of the Mesopotamian cuneiform script (*see* **Mesopotamian Cuneiform Script**). This script, being basically unsuited to the language, makes full understanding of many phonetic features (e.g., vowel length; voiced versus voiceless stops) difficult. The vowel system shows *a* (which reflects both I-E *a* and I-E *o*), *e* and *i* (which are distinguished in earlier texts, but may well in later ones represent a single phoneme), and *u*. There are four orders of stops (labial, dental, velar, labio-velar), and lack of voice is often indicated by gemination in spelling, although the converse is by no means always the case. Hittite is unique among Indo–European languages in preserving the continuants known as laryngeals. The number and precise nature of these is still the subject of debate; but both voiced and voiceless varieties can be detected, and in some cases they can be seen to give *a*- or *o*- coloration to an original *e* vowel.

Morphology

Nominal morphology is characterized by the loss of both the feminine gender and the dual number. Earlier texts show a full range of case forms in the singular, although in later texts dative and locative have merged. In the plural, the range of case forms is much reduced. In noun formation, a striking characteristic is the preservation in productive use of heteroclitic *r/n* stem neuters and of action nouns in *-sar*, *-tar*, and *-war*/*-mar*.

The verbal system shows two tenses (present and preterite), two moods (indicative and imperative), and two voices (active and medio-passive), together with two infinitives, a supine, a verbal noun, and a participle. The present indicative of the medio-passive is often marked by a suffixed *-ri* which links it to the medio-passive in Celtic, Italic, and Tocharian. There are also two conjugations (the *mi*- conjugation and the *hi*- conjugation), the first of which corresponds to the I-E present while the second is perfect in origin with the addition of a present marker.

Syntax

Syntax is on the whole simple and straightforward, and corresponds in general to that of the archaic forms of other I-E languages. Characteristic of Hittite is a liking for 'chains' of particles and enclitic pronouns placed at the beginning of a sentence or clause. Another interesting feature is the 'quasiergatival' construction, in which a neuter subject with a transitive verb is not permitted, and so an original ablative case is reinterpreted as a nominative.

Example

A Hittite sentence showing some of the above features is (in syllabic transcription)

(1) *an-da-ma-za pa-aḫ-ḫu-u-e-na-aš-ša u-da-ni-i me-ik-ki na-aḫ-ḫa-an-te-eš e-eš-tin*,

to be read

(2) *anda-ma-tsa pahhwenas-a uddani mekki nahhantes esten*

and translated

(3) 'moreover, on the subject of fire also be greatly fearful,'

In this sentence, *anda* acts as an adverb of transition, but is ultimately linked to the form seen in Greek *éndon*, Old Latin *endo; ma* is a connective particle; *tsa* is a reflexive particle; *pahhwenas* is the genitive of *pahhwr*, an *r/n* stem noun cognate with Greek *pûr* and showing the presence of an original laryngeal; *-a* is an emphasizing particle; *uddani* is the dative-locative of another *r/n* stem noun with a basic meaning of 'word' and a possible ultimate connection with an I-E verb of saying (cf. Old Welsh *dy-wedut*); *mekki*

is an adverbial neuter singular of an adverb meaning 'much, many' (cf. Skt *mah-*, Gk *mégas*); *nahhantes* is the participle (cf. Latin *amans*, *amantis*) of a verb perhaps cognate with Old Irish *nar*, 'timid'; and *esten* is the 2nd pl imperative of the I-E verb for 'to be.'

Records in the Hittite language cease with the collapse of Hittite power ca. 1180 B.C. There are signs that the language of classical Lydia is a later relative; but the precise relationship is obscure.

Hjelmslev, Louis Trolle (1899–1965)

F Gregersen, University of Copenhagen, Copenhagen, Denmark

© 2006 Elsevier Ltd. All rights reserved.

This article is reproduced from the previous edition, volume 3, pp. 1585–1586, ©1994, Elsevier Ltd.

The son of a prominent mathematician, Louis Trolle Hjelmslev was born on October 3, 1899, in Copenhagen. He studied comparative philology with Holger Pedersen (*see* **Pedersen, Holger (1867–1953)**) and took his master's degree in 1923. After a year in Prague, he went to Paris in 1926–1927 where most of the work that was published as *Principes de grammaire générale* (1928) was written. He wrote his dissertation on a traditional theme, viz. sound changes in Lithuanian, and was appointed Reader in Comparative Philology at Århus University in 1934, only to succeed Holger Pedersen as Professor of Comparative Philology at the University of Copenhagen (1937). Despite flattering proposals from abroad he stayed in Copenhagen for the rest of his life, though traveling widely, in particular after the war.

In his early years he was a tremendous worker and read extensively, but he was hit by a brain disease that slowly reduced his strength. When the disease started is hard to say, but his working tempo slowed down during the 1950s and his last five years were bitter ones. He died on May 30, 1965.

Hjelmslev was educated as a comparative philologist but he is better known for his participation in the structuralist movement. He claimed to follow through on Saussure's ideas in a way that no one else had done. Against the Prague school he maintained that the focus for a linguistic theory should be form only, and the distinction between form and substance is essential to his theory. His theory of language is called 'glossematics' and was developed in close collaboration with Hans Jørgen Uldall (*see* **Glossematics; Uldall, Hans-Jørgen (1907–1957)**). The most important works are *Essai d'une théorie des morphèmes* (1936), *Omkring Sprogteoriens Grundlieggelse* (1943, translated as *Prolegomena to a theory of language* by Francis J. Whitfield), *Le verbe et la phrase nominale* (1948), *La stratification du langage*, in *Word* (1954), and the posthumously published *Résumé of a theory of language* (1977, translated and edited by Francis J. Whitfield).

Hjelmslev had a tremendous impact on Danish linguistics, but he has also influenced in particular French structuralists, notably the Greimas school of structural semantics or semiotics.

It is a peculiar feature of his theory and his impact that he was concerned to establish a theory of language that either (as in *Prolegomena*) treated linguistics as the central scientific discipline, in that 'form' was seen to be the province of linguistics and the governing principle of the world as a whole, or held (as in *Stratification*) that both form and substance should be treated by a highly abstract and rigidly formalized algebraic linguistic theory. This last view seems to be more in line with the version of glossematics developed by Uldall.

In the 1980s, Hjelmslev's work again stirred up interest, partly because of his insistence on placing language in a broader semiotic framework, and partly because the Chomskyan era was drawing to a close in Europe. His work is readily available to the French-reading public (*Essais linguistiques* 1959, *Essais linguistiques II* 1973, *Nouveaux essais* 1985), while English and American readers may benefit from the early translations and the *Résumé*. All his

is an adverbial neuter singular of an adverb meaning 'much, many' (cf. Skt *mah-*, Gk *mégas*); *nahhantes* is the participle (cf. Latin *amans*, *amantis*) of a verb perhaps cognate with Old Irish *nar*, 'timid'; and *esten* is the 2nd pl imperative of the I-E verb for 'to be.'

Hjelmslev, Louis Trolle: Theory of the Sign

P Cobley, London Metropolitan University, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Louis Hjelmslev (1899–1965) was a Danish linguist and a member of the Copenhagen School of linguistics. His influence beyond linguistics, into semiotics, has been great, though not always acknowledged. Chiefly, this work has been filtered through Roland Barthes' theory of the sign; however, Hjelmslev's distinctions have also been used and promoted at great length in the work of Deleuze and Guattari (1983). Hjelmslev's prominence in linguistics derives from his post as Professor of Comparative Philology at Copenhagen University (1937–1965) and, particularly, in his founding of 'glossematics,' an approach derived from Saussure's investigations into *la langue* and the latter's insistence that this is a form and not a substance. Hjelmslev founded the Copenhagen Linguistic Circle with Viggo Brondal in 1931, and the Circle's proceedings, along with other contributions, continue to be published today in *Acta Linguistica Hafniensia*, the journal founded by them in 1939.

French translations of Hjelmslev's work assured his influence on nascent structuralism in the 1950s, as did English translations of *An outline of glossematics* (1957, with Hans-Jørgen Uldall), *Resume of a theory of language* (1975), and especially *Prolegomena to a theory of language* (1969). Hjelmslev's work of the early 1930s had proceeded from broadly phonological principles and generally corresponded with contemporary trends in structural linguistics. The advent of his glossematics marked a shift in the analysis of *langue*. Whereas Hjelmslev had previously focussed on 'distinctive features' as elements of form, glossematics sought to identify elements precisely as 'functions' in relation to 'functives.' A function exists, for example, between a class and its components, a chain and its parts, or a paradigm and its members (or 'between' members, parts, or components). A functive, on the other hand, is the 'terminal' – at either end – of a function.

Hjelmslev proceeds from the preliminary notions that language is a system of signs and that the sign – by virtue of its being 'for someone' – must be construed as a 'function.' However, he insists that the sign conceived in this way must be clarified as a 'sign-expression.' As such, then, there are two planes to be considered in the analysis of language as a sign system. The first is the 'expression plane,' which has both a form and a substance. The second is the 'content plane,' which has the same. Both are made up of a restricted number of non-sign entities, *figurae* (such as phonemes), which can combine to produce an unlimited number of signs. The fact that there are two planes of the sign means that, for Hjelmslev, the notion of the sign as simply 'for someone' is limited. This view tends to see the sign as a matter of an 'indication' by an 'expression' of some external 'content,' whereas the Saussurean view, according to Hjelmslev, sees the sign as generated by the connection between an expression and content. If the sign-relation is seen as a function, however, the functives of expression and content can never be separable, and this has consequences for the conception of the sign. Chiefly, Hjelmslev's work contends that the sign does not just indicate; it is made up of 'content-substance' ordered into 'content-form.' It is juxtaposed for sign users with other examples of content-form (e.g., 'ring' might indicate both jewelery for the finger and something that emanates from the telephone), and it is also constituted on the plane of expression as an 'expression-form' (containing specifically organized *figurae*), which is itself ordered to an 'expression-substance' (other pronunciations, other enunciations by other people, etc.).

By initiating analysis of functions on the planes of expression and content, Hjelmslev sought to escape what he called the "halting division of linguistics into phonetics, morphology, syntax, lexicography, and

unpublished papers and correspondence are now at the Royal Library at Copenhagen.

Hjelmslev, Louis Trolle: Theory of the Sign

P Cobley, London Metropolitan University, London, UK

© 2006 Elsevier Ltd. All rights reserved.

Louis Hjelmslev (1899–1965) was a Danish linguist and a member of the Copenhagen School of linguistics. His influence beyond linguistics, into semiotics, has been great, though not always acknowledged. Chiefly, this work has been filtered through Roland Barthes' theory of the sign; however, Hjelmslev's distinctions have also been used and promoted at great length in the work of Deleuze and Guattari (1983). Hjelmslev's prominence in linguistics derives from his post as Professor of Comparative Philology at Copenhagen University (1937–1965) and, particularly, in his founding of 'glossematics,' an approach derived from Saussure's investigations into *la langue* and the latter's insistence that this is a form and not a substance. Hjelmslev founded the Copenhagen Linguistic Circle with Viggo Brondal in 1931, and the Circle's proceedings, along with other contributions, continue to be published today in *Acta Linguistica Hafniensia*, the journal founded by them in 1939.

French translations of Hjelmslev's work assured his influence on nascent structuralism in the 1950s, as did English translations of *An outline of glossematics* (1957, with Hans-Jørgen Uldall), *Resume of a theory of language* (1975), and especially *Prolegomena to a theory of language* (1969). Hjelmslev's work of the early 1930s had proceeded from broadly phonological principles and generally corresponded with contemporary trends in structural linguistics. The advent of his glossematics marked a shift in the analysis of *langue*. Whereas Hjelmslev had previously focussed on 'distinctive features' as elements of form, glossematics sought to identify elements precisely as 'functions' in relation to 'functives.' A function exists, for example, between a class and its components, a chain and its parts, or a paradigm and its members (or 'between' members, parts, or components). A functive, on the other hand, is the 'terminal' – at either end – of a function.

Hjelmslev proceeds from the preliminary notions that language is a system of signs and that the sign – by virtue of its being 'for someone' – must be construed as a 'function.' However, he insists that the sign conceived in this way must be clarified as a 'sign-expression.' As such, then, there are two planes to be considered in the analysis of language as a sign system. The first is the 'expression plane,' which has both a form and a substance. The second is the 'content plane,' which has the same. Both are made up of a restricted number of non-sign entities, *figurae* (such as phonemes), which can combine to produce an unlimited number of signs. The fact that there are two planes of the sign means that, for Hjelmslev, the notion of the sign as simply 'for someone' is limited. This view tends to see the sign as a matter of an 'indication' by an 'expression' of some external 'content,' whereas the Saussurean view, according to Hjelmslev, sees the sign as generated by the connection between an expression and content. If the sign-relation is seen as a function, however, the functives of expression and content can never be separable, and this has consequences for the conception of the sign. Chiefly, Hjelmslev's work contends that the sign does not just indicate; it is made up of 'content-substance' ordered into 'content-form.' It is juxtaposed for sign users with other examples of content-form (e.g., 'ring' might indicate both jewelery for the finger and something that emanates from the telephone), and it is also constituted on the plane of expression as an 'expression-form' (containing specifically organized *figurae*), which is itself ordered to an 'expression-substance' (other pronunciations, other enunciations by other people, etc.).

By initiating analysis of functions on the planes of expression and content, Hjelmslev sought to escape what he called the "halting division of linguistics into phonetics, morphology, syntax, lexicography, and

semantics" (1969: 59). Rather than dividing signs and texts into the objects identified by these subdisciplines of linguistics, Hjelmslev's glossematics thus instituted a procedure that treated all text elements as relations of function within expression and content. Yet because the relation of function was seen by him as all-important, and because both were made of ('meaningless') *figurae*, those elements that make up 'expression' and those that make up 'content' are to be considered interchangeable. It was the combination of Hjelmslev's resolute systematization and his facilitation of the mutability of planes according to function that made his glossematics so amenable to other structuralist linguists and thinkers. The structural semantics of A. J. Greimas and the theory of denotation, connotation, and metalanguage put forth by Roland Barthes are both predicated on a glossematic model. Ultimately, Hjelmslev saw his systematization in linguistics as a corrective to the dominant descriptive tendencies in humanist thought.

Charles Francis Hockett, the author of *A course in modern linguistics* (1958), was one of the leading American linguistic figures in the interregnum between Bloomfield and Chomsky. He was born on January 17, 1916, in Columbus, Ohio, as the fourth child of Homer Carey Hockett, professor of American history at Ohio State University, and Amy Francisco Hockett. At the age of 16, Charles enrolled at Ohio State, to receive his B.A. and M.A. in ancient history jointly in 1936. He went on with his studies at Yale. He majored in anthropology and linguistics and was awarded the Ph.D. in 1939 after submitting a dissertation on Potawatomi. He spent the next two years of postdoctoral studies at Chicago, where he encountered Bloomfield, and at Michigan.

He was drafted in February 1942, but after basic training was transferred to Army Service Forces, where his duty was first to supervise the learning of Chinese and Japanese by the military personnel, and later to prepare foreign language instructional materials at a language section of the U.S. Armed Forces Institute in New York.

Discharged in February 1946, he worked for a while with the American college dictionary, and then started his university teaching career by joining the newly formed Division of Modern Languages at Cornell University as assistant professor in charge of teaching Chinese. He remained affiliated with Cornell until his retirement in 1982. In 1957 he was invited to become a member of Cornell's Department

semantics" (1969: 59). Rather than dividing signs and texts into the objects identified by these subdisciplines of linguistics, Hjelmslev's glossematics thus instituted a procedure that treated all text elements as relations of function within expression and content. Yet because the relation of function was seen by him as all-important, and because both were made of ('meaningless') *figurae*, those elements that make up 'expression' and those that make up 'content' are to be considered interchangeable. It was the combination of Hjelmslev's resolute systematization and his facilitation of the mutability of planes according to function that made his glossematics so amenable to other structuralist linguists and thinkers. The structural semantics of A. J. Greimas and the theory of denotation, connotation, and metalanguage put forth by Roland Barthes are both predicated on a glossematic model. Ultimately, Hjelmslev saw his systematization in linguistics as a corrective to the dominant descriptive tendencies in humanist thought.

Charles Francis Hockett, the author of *A course in modern linguistics* (1958), was one of the leading American linguistic figures in the interregnum between Bloomfield and Chomsky. He was born on January 17, 1916, in Columbus, Ohio, as the fourth child of Homer Carey Hockett, professor of American history at Ohio State University, and Amy Francisco Hockett. At the age of 16, Charles enrolled at Ohio State, to receive his B.A. and M.A. in ancient history jointly in 1936. He went on with his studies at Yale. He majored in anthropology and linguistics and was awarded the Ph.D. in 1939 after submitting a dissertation on Potawatomi. He spent the next two years of postdoctoral studies at Chicago, where he encountered Bloomfield, and at Michigan.

He was drafted in February 1942, but after basic training was transferred to Army Service Forces, where his duty was first to supervise the learning of Chinese and Japanese by the military personnel, and later to prepare foreign language instructional materials at a language section of the U.S. Armed Forces Institute in New York.

Discharged in February 1946, he worked for a while with the American college dictionary, and then started his university teaching career by joining the newly formed Division of Modern Languages at Cornell University as assistant professor in charge of teaching Chinese. He remained affiliated with Cornell until his retirement in 1982. In 1957 he was invited to become a member of Cornell's Department

of Anthropology, and was subsequently named the Goldwin Smith Professor of Linguistics and Anthropology. He remained at Cornell until retiring to emeritus status in 1982. Beginning in 1986, he was first visiting professor, then adjunct professor of linguistics at Rice University, an appointment still in effect at the time of his death on November 3, 2000.

While on furlough in 1942 he married a mathematician, Shirley Orlinoff, with whom he had five children. Hockett also wrote poetry and composed music, often performing with his family and colleagues. He tried his hand at various types of musical compositions, ranging from short pieces to chamber works to a full-length opera, *The love of Doña Rosita*.

With the advantage of retrospect, one can discern two stages in Hockett's research: a neo-Bloomfieldian structuralist stage and a poststructuralist follow-up stage, which actually overlapped at times in particular works. It is intriguing that the research that can be characterized as the latter in spirit has often been a prophetic prefiguration of the issues raised and proposals suggested many years later by linguists working in functional, cognitive, and relevance theory frameworks.

Although Hockett worked with and under many renowned linguists, beyond a doubt the major influence on him was Bloomfield. Hockett is considered Bloomfield's most important disciple and exegete. He collected, edited, and published much of Bloomfield's unfinished work, and in 1970, he produced *A Leonard Bloomfield anthology*. Hockett considered his own 1958 textbook to be essentially a commentary on and updating of Bloomfield's *Language* (1933), although it was an original volume that served as a standard introduction for generations of linguists. This is, for example, where he developed the design-feature approach to the study of communication. The original seven features were subsequently expanded and modified into the 13-feature system in Hockett (1960).

Like Bloomfield, Hockett excelled in linguistic description, providing a series of meticulous studies of a number of phenomena in Algonquian (Algonquin), Chinese, Fijian, and English. Although he is often regarded as being primarily a phonologist and one of the fathers of the applied linguistics movement, he has contributed significantly to linguistic theory, using his descriptive work as a platform for launching theoretical proposals. Among Hockett's legacy for generations of linguists we thus find the notion of portmanteau morph (a form that realizes two morphemes at once), introduced in Hockett (1947), and the distinction between the item and arrangement (IA), item and process (IP), and word and paradigm (WP) models of description, discussed in Hockett (1954). His *Manual of phonology* (Hockett, 1955) was innovative in its attempt to work out a principled typology of phonological systems along the lines of the Prague school, arguing for immediate constituents in phonology in a framework including the syllable. In characterizing these, he used terms such as onset, peak, interlude, and coda (a parallel probably arising from his keen interest in music).

A turning point in his research was the beginning years of generative revolution. The thread running through Hockett's work after the 1960s was the complete rejection of what he saw as the three pillars of post-Bloomfieldian linguistics (which he himself had been developing): the concept of language as a rigid and well-defined system (an outgrowth of the classical structuralist theory that he saw as central to generative linguistics), the adoption of an item-and-arrangement model, and the consensus that grammar and semantics should be kept separate (Hockett, 1968: 31–32). He came to realize that the available linguistic models were incapable of dealing even with most ubiquitous and natural phenomena of language in action, e.g., with blends. This led him to conclude that any adequate linguistic theory had to be dynamic and hearer centered. He took three basic mechanisms to be the fundamental elements in the generation of speech: "analogy; blending (unresolved conflicts of analogies), and editing." The title of his last full-length book (Hockett, 1987) reflects his intention to work further toward the formulation of a theory of hearing and speaking and redirect linguistic science toward a re-examination of the nature of language in terms of how it operated in, and in fact was created within, the speaking-hearing-understanding situation.

Hoijer, Harry (1904–1976)

M Makihara and R M Vago, Queens College, CUNY, Flushing, NY, USA

© 2006 Elsevier Ltd. All rights reserved.

Harry Hoijer was one of the greatest anthropologist-linguists of the 20th century. He was born in Chicago to Swedish immigrant parents. He received his formal education at the University of Chicago: he received a B.A in engineering and mathematics in 1927, and an M.A. in 1929 and a Ph.D. in 1931, both in anthropology. As a faculty member at his alma mater, he honed his love of field work and developed an interest in the field of linguistics under the tutelage and influence of Edward Sapir; their relationship developed into collaborative work and led to Hoijer becoming Sapir's literary executor.

In 1940 Hoijer moved to UCLA, where he made significant contributions to the development and flourishing of the Anthropology Department as well as the interdisciplinary Linguistics Program, eventually serving as Chairman of each (1942–1943 and 1948–1952 in anthropology, 1959–1963 in linguistics). He was a much beloved and admired teacher; his prodigious and highly respected research earned him the reputation as the most renowned Athapaskanist, a distinction not at all diminished by the passage of time. His towering stature (he stood tall both physically and metaphysically) within and beyond the anthropological and linguistic scholarly community was well recognized: He was elected President of the American Anthropological Association (1958) and President of the Linguistic Society of America (1959), served as Chairman of the Committee on Research in American Indian Languages of the American Council of Learned Societies (1950–1969), was a consultant to the UNESCO Commission on Language and Mentality, and served on the editorial boards of the *International Journal of American Linguistics* and the *American Anthropologist*.

Hoijer was a highly productive scholar, authoring around 70 articles and books. His contributions cluster around the following themes: (a) detailed diachronic and synchronic studies (the latter based on elicitations from native speakers) of the phonological, morphological, syntactic, and semantic structures of American Indian languages, most notably Athapaskan; (b) discussion of issues of language and culture, including the relationship between language and thought ('Sapir-Whorf hypothesis'); and (c) collections of oral and written texts.

Hoijer's most significant works include *Tonkawa: an Indian language of Texas* (1933), based on his doctoral dissertation field work in Oklahoma on Tonkawa, a Coahuiltecan language; *Navajo texts* (1942), co-authored with Sapir; *An introduction to anthropology* (1953, 1st edn.), co-authored with Ralph L. Beals; *The phonology and morphology of the Navaho language* (1967), co-authored with Sapir; *Tonkawa texts* (1972); and *Navajo lexicon* (1974), based on Sapir's field notes.

Undena Publications published a series of anthologies, all with the subtitle *Essays in honor of Harry Hoijer* (Cavalli-Sforza *et al.*, 1986; Fernandez *et al.*, 1982; Greenberg, 1980; Mintz *et al.*, 1985; Sanders *et al.*, 1984). A list of Hoijer's writings was compiled by William Bright in 1964, supplemented by Victoria Fromkin in 1977 (Bright, 1964; Fromkin, 1977). A sample of Hoijer's works (correspondence, texts and notes, collections, audio recordings) is available at the Harry Hoijer Collection of the American Philosophical Society.

Hokan Languages

T Kaufman, University of Pittsburgh, Forest Hills, PA, USA

© 2006 Elsevier Ltd. All rights reserved.

History of Scholarship

The Hokan Hypothesis

The Hokan hypothesis (the hypothesis that the Hokan languages are a genetic group descending from a common protolanguage) was the result of a taxonomically-motivated attempt in 1912–1913 by Roland P. Dixon and Alfred Louis Kroeber to deal with the very large number of apparently distinct genetic groupings of languages (according to John Wesley Powell's 1890 classification) known for aboriginal California – large in comparison with other parts of North America. Dixon and Kroeber, who had moderate amounts of (phonologically not very accurate) data from, and moderate amounts of familiarity with, a large number of California languages, felt that by looking at all the languages panoramically and grouping them by overall shared lexical similarities, a set of groupings could be achieved that might as well be viewed as genetic. This exercise yielded two primary sets of languages that Dixon and Kroeber labeled Penutian and Hokan, as well as some ungrouped languages. Penutian included Yokutsan (Yokuts), Miwokan, Costanoan, Wintuan (Wintu), and Maiduan; Hokan included Karuk (Karok), Shastan, Achumawi-Atsugewi (Achumawi), Pomoan (Pomo, Southeastern), Yanan (Yana), Esalen (Esselen), Salina (Salinan), Washu (Washo), and Yuman (Dixon and Kroeber, 1913a, 1913b).

Additions to the Hokan 'Core'

Later Kroeber added Seri and Chontal to Hokan (Kroeber, 1915). He (?Sapir) misguidedly tried to add Chumashan (Chumash) to Hokan. Edward Sapir, the most able American linguist between 1905 and 1925, who had done doctoral research on Takelma, added Takelma, Klamath (Klamath-Madoc), Sahaptian (Sahaptin), Alsea, Kusan (Coos), Chinookan (Chinook), Tsimshian, and Sayusla (Siuslaw) to Penutian. He added Pajalat, Yeme*, and Yue* to Hokan, but his efforts at adding Karankawe were misguided. He misguidedly tried to add Sutiaba to Hokan. In 1953, Greenberg and Swadesh added Tol to Hokan.

Hokan as a Superstock or Phylum

When originally proposed, the Hokan and Penutian hypotheses were not directly comparable to hypotheses of the order of Algonkian or Yuta-Nawan, because the numbers of resemblant forms that could be deployed and the sound correspondences that could be discerned were so few that any true genetic relationship that lay behind the phenomena was necessarily very remote. No certainty could be felt that such a hypothesis would ever be demonstrated to be correct through reconstruction. The terms 'family' and 'stock' had been used by comparative linguists since before 1800, but by 1900, most linguists felt these terms should be reserved for genetic groupings that were not in doubt. Consequently, the terms 'phylum' and 'superstock' began to be used between 1930 and 1960 to refer to such hypotheses as Hokan and Penutian. Proposed genetic groupings were often preceded by the prepound 'macro-,' thus Macro-Hokan, Macro-Penutian, and Macro-Chibchan.

History of Scholarship

The Hokan Hypothesis

The Hokan hypothesis (the hypothesis that the Hokan languages are a genetic group descending from a common protolanguage) was the result of a taxonomically-motivated attempt in 1912–1913 by Roland P. Dixon and Alfred Louis Kroeber to deal with the very large number of apparently distinct genetic groupings of languages (according to John Wesley Powell's 1890 classification) known for aboriginal California – large in comparison with other parts of North America. Dixon and Kroeber, who had moderate amounts of (phonologically not very accurate) data from, and moderate amounts of familiarity with, a large number of California languages, felt that by looking at all the languages panoramically and grouping them by overall shared lexical similarities, a set of groupings could be achieved that might as well be viewed as genetic. This exercise yielded two primary sets of languages that Dixon and Kroeber labeled Penutian and Hokan, as well as some ungrouped languages. Penutian included Yokutsan (Yokuts), Miwokan, Costanoan, Wintuan (Wintu), and Maiduan; Hokan included Karuk (Karok), Shastan, Achumawi-Atsugewi (Achumawi), Pomoan (Pomo, Southeastern), Yanan (Yana), Esalen (Esselen), Salina (Salinan), Washu (Washo), and Yuman (Dixon and Kroeber, 1913a, 1913b).

Additions to the Hokan 'Core'

Later Kroeber added Seri and Chontal to Hokan (Kroeber, 1915). He (?Sapir) misguidedly tried to add Chumashan (Chumash) to Hokan. Edward Sapir, the most able American linguist between 1905 and 1925, who had done doctoral research on Takelma, added Takelma, Klamath (Klamath-Madoc), Sahaptian (Sahaptin), Alsea, Kusan (Coos), Chinookan (Chinook), Tsimshian, and Sayusla (Siuslaw) to Penutian. He added Pajalat, Yeme*, and Yue* to Hokan, but his efforts at adding Karankawe were misguided. He misguidedly tried to add Sutiaba to Hokan. In 1953, Greenberg and Swadesh added Tol to Hokan.

Hokan as a Superstock or Phylum

When originally proposed, the Hokan and Penutian hypotheses were not directly comparable to hypotheses of the order of Algonkian or Yuta-Nawan, because the numbers of resemblant forms that could be deployed and the sound correspondences that could be discerned were so few that any true genetic relationship that lay behind the phenomena was necessarily very remote. No certainty could be felt that such a hypothesis would ever be demonstrated to be correct through reconstruction. The terms 'family' and 'stock' had been used by comparative linguists since before 1800, but by 1900, most linguists felt these terms should be reserved for genetic groupings that were not in doubt. Consequently, the terms 'phylum' and 'superstock' began to be used between 1930 and 1960 to refer to such hypotheses as Hokan and Penutian. Proposed genetic groupings were often preceded by the prepound 'macro-,' thus Macro-Hokan, Macro-Penutian, and Macro-Chibchan.

Doubters of the validity of the Hokan hypothesis may label it Macro-Hokan; those who believe in the hypothesis will speak of the Hokan stock.

Further Comparative Studies

Except for a small number of proposed reconstructions by Sapir, none of the above studies did more than assemble sets of resemblant forms with comparable (often identical) glosses or functions.

Since 1950, renewed efforts at establishing Hokan or parts of it have been devoted by linguists working on documenting these languages, especially as dissertations by graduate students at University of California at Berkeley (UC Berkeley). The Hokan comparative studies have been spin-offs of their documentation work. Even now, however, except for the reconstruction of Pomoan and Yuman, Hokan comparative studies at most surpass those of the period 1900–1940 by attempting to find sound correspondences among the resemblant forms compared. The other main achievement is that the data that are compared are for the most part phonologically accurate.

The Hokan stock is made up of the following (reasonably) well-documented languages and families: (1) Pomoan family; (2) Chimariko language; (3) Yanan small family; (4) Karuk language; (5) Shastan (Shasta) language; (6) Achuan family; (7) Washu language; (8) Salina language; (9) Yuman family; (10) Seri language; (11) Chontal language area; (12) Tol (= Jicaque) small family.

Some other poorly-documented languages are probably Hokan, but because of lack of data they cannot serve as the basis of reconstruction: Esalen, Kochimi* (Cochimí), Pajalat, Yeme* = Komekrudo, maybe Yue* = Kotoname.

Others often thought of as Hokan are probably not Hokan: Chumashan, Tonkawa, Karankawe. In any case, the first two, which are reasonably well documented, have not successfully been shown to be Hokan, in spite of Sapir's efforts.

Contra Sapir (1925) (aped in Greenberg, 1983) Tlapaneko-Sutiaba is Oto-Mangean, not Hokan. Whether Hokan and Oto-Mangean are related remains an open question. In Kaufman (1990), I suggest that they are indeed related.

To date, the most notable contributions to Hokan typology and comparative Hokan grammar have been made by Sapir, Jacobsen, Langdon, Gursky, Grey, and Oswalt.

Kaufman has a fair amount of evidence to suggest a North : South division, North being 1–9, and South being 10–17.

The Hokan hypothesis is widely known; it may be accepted by nonspecialists in American Indian languages, and is accepted (with a specific list of languages shorter than the list given in this article) by many specialists in languages of Oregon, California, and Meso-America. Specialists in American Indian languages with no deep familiarity with Hokan languages are generally skeptical of the Hokan hypothesis. This skepticism is largely because, although detailed comparative work leading to reconstruction has been carried out for some of the parts of the Hokan grouping (Yuman, Pomoan), comparative work at the level of the whole stock has not yet led to fully elaborated reconstruction of either phonology or grammar.

The Hokan languages are known from three separate areas: Alta California and Baja California; Southern Texas and Coahuila; Southeastern Oaxaca and Northern Honduras. Many languages of northwestern and northeastern Mexico have disappeared with essentially no documentation: some of these may have been Hokan. From the current distribution, we could imagine a Hokan homeland or primary geographical concentration in southern California with extensions to northern California and the southern plains (skipping over what?). The Hokan languages of Meso-America would have to represent migration, as might also those of the southern plains.

The time depth of Hokan is probably quite great, perhaps 8000 years, and the population movements that need to be postulated would possibly not have been associated with distinctive archeological traditions.

Evidence assembled by Kaufman suggests that Hokan and Oto-Mangean are genetically related. If so, proto-Oto-Mangean (ca. 6500 mc) would have developed from a Hokan-like language with some of the following changes:

1. syllable-final obstruents would have dropped or become laryngeals
2. surviving features of the changed consonants would have yielded a three-way tonal contrast
3. a thorough-going shift on the phrase and clause level from right-headedness (OV) to left-headedness (VO) would have affected all morpheme arrangements above the level of derivational morphology (which involved only full words and clitics).

The Hokan Languages Classified

In the following sections, % means that the language is extinct.

Northern Hokan

Sonoma

1. Pomo family [pPom] (total number of speakers < 200)

Western Pomo language area [WPom]
SouthWestern (Kashaya) Pomo emergent lg [SWPom] EL: ca. 50
Southern Pomo emergent lg [SPom] EL: < 40
Central Pomo (Yokaya & Boya) emergent lg [CPom] EL: < 40
%Northern Pomo lg [NPom]
NorthEastern (Salt) Pomo lg [NEPom] EL: 1
%Eastern Pomo lg [EPom]
SouthEastern (Sulphur Banks) Pomo lg [SEPom] EL: < 10

Northern California

2. %Chimariko [ch'imari*ko] language [Chi]
3. %Yana language area [pYan]
Yana emergent lg [Yan]
Northern Yana dial [NYan]
Central Yana dial [CYan]
Southern Yana dial [SYan]
Yahi emergent lg [Yah]
4. Karuk [karu*k] language [Kar] EL: 126
5. %Shastan family [pSha]
Shasta lg [Sha]
New River Shasta lg [NRSha]
Okwanchu lg [Okw]
Konomihu lg [Kon]
6. Achu family [pAch] (total number of speakers < 100)
Achumawi (Pit River) lg [Ach] EL: 81
Atsugewi (Hat Creek) lg [Ats] EL: 4
Atsuge (Hat Creek) dial [Ats-HC]
Apwaruge (Dixie Valley) dial [Ats-DV]

Great Basin

7. Washu language [Wsh] EL: < 10

California Coast

8. %Esalen language [Esa]
%Salina (Enalen) language [Sal]
Miguelenyo dial [Sal-M]
Antonienyo dial [Sal-A]

Southern Hokan

Southwest

9. Yuman-Kochimi* family [pYK] (total number of speakers ca. 2500)
Yuman division [pYum]
Pai language area [Pai]
Paipai emergent lg [Pp] EL: 300 BAJA
Havasupai-Hwalapai emergent lg
Havasupai dial [Hav] EL: 404
Hwalapai dial [Hua] EL: 440
Yavapai emergent lg [Yav] EL: 163
River language area [Riv]
Mohave emergent lg [Moh] EL: 234
Maricopa-Yuma emergent lg
Maricopa dialect [Mar] EL: 181
Yuma dialect [Yum] EL: 343
Dieguenyo language area [Die] EL: 97
Mesa Grande ('Iipay) emergent lg [MG]
Campo (Kumeyaay) emergent lg [Cam]
La Huerta (Tiipay) emergent lg [Hue]
Cocopa lg [Coc] EL: 321
Kiliwa lg [Kil] EL: 24-32 BAJA
%Kochimi* language [Cch]
10. Seri language [Ser] EL: <215 BAJA

Coahuila

%Pajalat (Coahuilteco) language [Paj]

%Yeme*an (Comecrudoan) family [pYem]
Yeme* (Comecrudo) lg [Yem]
Garza lg [Gar]

%Yue* (Cotoname) language [Yue]

Oaxaca

11. Chontal (Tequistlatecan) family [pCho]
Huamelulteco = Lowland Chontal lg [LCho] EL: 1 k
Tequistlateco = Highland Chontal lg [HCho] EL: 3.6 k

Honduras

12. Tol (Jicaque) family [pTol]
Eastern Tol lg [ETol] EL: 350
%Western Tol lg [WTol]

Descriptive Work on Hokan Languages

From 1900 to 1950, the documentation of Hokan languages that stands the test of time includes Edward Sapir's documentation of Yanan and John Peabody Harrington's documentation of Karuk, Chimariko, and Salina. Just before 1950, Abraham Halpern documented Yuman.

Since 1950, Hokan languages of Meso-America have been documented first by members of the

Summer Institute of Linguistics and later by academic linguists from the United States.

Also since 1950, Hokan languages of Alta California (and Washu in Nevada) and Baja California have been the object of descriptive study leading to Ph.D. dissertations by students of the University of California at Berkeley. Since 1970, several linguists trained by Berkeley Ph.D.s have documented Hokan languages of Alta and Baja California.

Characteristics of Hokan Languages

Phonology

Phonemic Contrasts in Hokan Languages To get an idea of what the broadly general traits of Hokan phonological systems are, I present below those phonological contrasts that are common or predominant in these languages.

1. /C'/ vs. /C/: pPom, Chi, Yan, Sha, Ach, Wsh, Sal, Paj, pCho, pTol no /C'/: Kar, pYum, Ser, [Yem unclear]
2. /C^h/ vs. /C/: pPom, Chi, Yan, pAch, Wsh, pTol no /C^h/: Kar, Sha, Sal, pYum, Ser, Paj, pCho, [Com unclear]
3. /ṭ/ vs. /t/: pPom, Chi, Sal, [pYum] no /ṭ/: the rest
4. /ĉ/ vs. /ȼ/: Chi, Sha, Sal, Paj no contrast: the rest
5. /k^y/ vs /k/ or /q/: pPom, pYum no contrast: the rest
6. /q/ vs. /k/: [pPom], Chi, Ach, pYum no contrast: the rest
7. /k^w/ vs. /k/: pYum, Paj, Com, pCho no /k^w/: the rest
8. /f/ vs. /p/: Kar, Ser, pCho no /f/: the rest
9. /ŝ/ or /ṣ/ vs. /s/: pPom, Chi, [Kar], Ach, Wsh, Sal, pYum, Ser, Paj no contrast: Yan, Sha, Ats, Yem, pCho, pTol
10. /x^w/ vs. /x/: pYum, Paj, Yem, pCho no /x^w/: the rest
11. /h/ vs. /x/: [pPom], Chi, [Yan], Sha, Kar, Ach, [Sal] no contrast: the rest
12. /r/ vs. /l/: Yan, pAch, pYum no contrast: the rest
13. /e/ vs. /i/: pPom, Chi, Yan, Sha, Ach, Wsh, Ser, Paj, Yem, pCho, pTol no contrast: Kar, Ats, Sal, pYum
14. /o/ vs. /u/: pPom, Chi, Yan, Ach, Wsh, Paj, Yem, pCho, pTol no contrast: Kar, Sha, Ats, Sal, pYum, Ser
15. /ɨ/ vs. /i/ or /u/: Wsh, pTol no /ɨ/: the rest
16. vowel length: pPom, [Chi], Yan, Sha, pAch, Wsh, Sal, pYum, Ser, Paj no contrast: ?pCho, pTol
17. stress or pitch: pPom, Kar, Sha, pAch, Wsh, Sal, pYum, Ser, pCho no contrast: Chi, Yan, Yem, pTol.

Table 1 Basic consonants and vowels in Hokan languages

Consonants	*Vowels*
p t c k	*i u*
p' t' c' k'	*e o*
s ŝ x h	*a*
m n	
l	length /:/
w y	stress /*/

Note: only Kar, Yum, and Ser lack glottalized obstruents; only Cho and Tol lack vowel length; only Chi, Yan, Yem, and Tol lack contrastive stress.

A sort of common core that is predominant (though not universal) in the Hokan languages is shown in (Table 1).

Just in terms of the phonemic contrasts commonly found in Hokan languages, the set of phonemic contrasts shown in Table 2 is the maximum that is supported typologically (i.e., found in at least three branches).

Syllable Structure

A syllable may begin with a consonant or not; it may end with a consonant or not. Some languages tolerate syllable onsets of the shape /Cx/ or /CY/ (where Y is a semivowel); many languages tolerate syllable codas of the shape /YC/.

I postulate the following basic phonological structure for a proto-Hokan lexical item of one to three syllables that is not a compound ($ is syllable boundary):

(1) $([C(x)]V[H])$C(x/w)V(H) (Y) (C)$(+CV)

Grammar

Hokan morphology is typically OV, while several Hokan groups currently show VO syntax.

Grammatical traits that will be discussed are as follows: alignment and person markers, nouns, verbs, adjectives, interrogatives, and quantifiers; examination of these traits is followed by a discussion of word order.

Alignment and Person Markers Most Hokan languages (e.g., Yan, Yum, Ser) have accusative case-marking; some (e.g., Chi, C&E Pom, Cho) have active case-marking. While Ergative languages often have completely different sets of person markers for ergative versus absolutive case (Mayan, Philippine languages), Accusative (Yuta-Nawan [Uto-Aztecan] family, Sapotekan [Zapotecan] family) and Active (Siuan [Siouan] family, Masatekan [Popolocan] family) languages often show related or even identical

Table 2 Phonenic contrasts in Hokan languages

Consonants	*Vowels*

markers for the case categories that encode Agent and Patient.

In Yanan, an Obj-Subj suffixed person-marking combination follows TAM markers on the verb. In Chontal, an Active person marker precedes the verb stem and a Neutral (= Stative) person marker follows all other verbal inflexional suffixes. In Yuman and Seri, a prefixed Obj-Subj combination precedes the verb. In Chimariko, Agent or Patient is prefixed to the verb (the category that is marked is chosen according to a person hierarchy). Since in Pom and Sal, verbs are not person-marked for subject and object agreement, it seems likely that proto-Hokan had no such marking. The Chontal order reflects its SIVO pattern (VO is favored by Meso-American languages: I means indirect object), and the Seri, Yuman, and Chimariko patterns reflect their current SV and OV word orders, which are probably the proto-Hokan orders as well, although the pattern with full NP arguments is specifically SOV, not OVS. The Yanan, Yuman, and Seri data suggest that in early Hokan there may have existed an O-V (O-S?) clitic combination for person markers. The Yanan order would then reflect the verb-first syntax of Yanan. If pHokan was an Active rather than an Accusative language, the alignment categories of the pronominal clitic combination would be Neutral-Active. See below for possessor marking on nouns.

Nouns The noun stem is made up of a root optionally followed by a nominalizer ('infinitive/gerund,' 'agentive'), or a 'first-order nominal suffix' (Pom, Chi, Wsh, Esa, Yum: not productive) and a 'second-order nominal suffix' ('diminutive,' 'female'). In Pomo and Chimariko, a noun root may be preceded by another noun root to form a noun-noun compound with the first noun modifying the second; Salina and Yuma have no such compounding, and the status of such compounds in proto-Hokan is still in doubt.

(2) | (NOMLZ) |
(ROOT) { **ROOT** } (NOM_2)
| (NOM_1) |

The noun word consists of a noun stem plus up to two preposed optional grammatical markers, a 'possession state prefix' ('absolutive of intimately possessed noun'/'substance or mass noun prefix' [Yum, Ser, Cho, Tol], 'body-part prefix'/'possessed state of intimately possessed noun' [Pom, Chi, Yum, Ser, Cho], 'indefinite third person (+/− possessive)'/ 'absolutive noun prefix' [Pom, Kar, Sha, Yan, Wsh, Sal, Yum, Ser]), and a 'proclitic classifier' ('proclitic count noun article,' 'proclitic mass/plural noun article,' 'absolutive noun prefix'), one optional 'possession state suffix' ('absolutive') and one obligatory 'case suffix.' The classifier has become a prefix in many languages.

The cases are both locative and relational, but the only relational cases that have etymologies are limited to Southern Hokan and encode switch-reference (same subject vs. different subject).

(3) (CLASS) (POSS) **NOUNSTEM** (POSS) CASE

Locative cases suffixes encode such functions as 'by means of,' 'from,' 'at,' 'in,' and so on.

Verbs The verb stem is made up of a root optionally preceded by a stativizer ('adjective-like intransitive'), a causativizer, or an incorporated instrumental prepound (Pom, Chi, Yan ['primary verbs'], ?Sha, *Kar, Ach, Ats, Wsh, Yum, Ser, *Cho) and optionally followed by a 'first-order verbalizer' ('to do X [X = noun, numeral]) and an incorporated 'directional postpound' (Pom, Chi, Yan, Kar, Sha, Ats, Wsh, Yum, Cho).

Both Northern and Southern languages have instrumental prepounds. Only Salina seems definitely to lack them. Instrumental prepounds encode such meanings as 'with the mouth,' 'by speaking,' 'by biting/chewing,' 'by blowing,' 'with the foot,' 'with the hand.' They are seemingly recruited mostly from noun and verb roots.

Both Northern and Southern languages have directional/locative postpounds. Again, only Salina seems definitely to lack them. Directional/locative postpounds encode such meanings as 'down,' 'up,' 'in,' 'out,' 'away,' 'thither,' 'hither,' 'here and there.'

It is not clear whether there is widespread simple noun incorporation or verb root compounding. No incorporation is found in ?Pom, Sal, or Yum. V-N incorporation is found in Yan, but is probably an innovation reflecting its VO syntax. Langdon (1988) shows that compound verb stems whose first member is not necessarily instrumental occur in Yana, Shasta, Atsugewi, and Washu.

(4) | (STAT) |
{ (CAUS) } **ROOT** ($VRBLZ_1$) (DIR)
| (INSTR) |

The verb word (or verb complex) consists of a verb stem plus up to three preposed optional grammatical markers and up to five postposed grammatical markers, of which one is obligatory. The preposed markers are [−1] pluralizer prefix (Yum, Paj, Pom, Yan, Ats), [−2] future proclitic (Yan, Kar, Wsh, Sal, Ser, Cho, Paj, Tol), [−3] temporal subordinator proclitic ('when, while, after': Pom, Yum, Sal). The postposed markers are [+1] passivizer suffix (Sal, Yum, Ser) or SHIFTER (infinitive, agentive), [+2] andative suffix ('to go and verb': Northern Hokan only), [+3] obligatory TAM_1 suffix (e.g., imperative, present, future/optative, past/completive, remote past, desiderative), [+4] TAM_2 suffix (e.g., conditional), [+5] TAM_3 enclitic (e.g., customary/habitual). Verb-TAM order is found generally in Hokan: Pom, Chi, Yan, Kar, Wsh, Sal, Yum, Cho.

(5) (TEMP SUBORD) (FUT) (PL) **VERBSTEM** (PASS) (ANDAT) TAM_1 (TAM_2) (TAM_3)

Adjectives Some adjective-like words act like nouns and some act like verbs. While it is possible that adjectives as a class originally had no independent existence, it is equally possible that there were two kinds of adjectives that were neither nouns nor verbs, as there are in Nahua (Yora), Mayan, and Bantu languages, to name just three cases.

Interrogatives In Amerindian languages and elsewhere, interrogative words are often encoded by lexical items that also have generic reference, such that *who?* = 'person,' *what?* = 'thing,' *where?* = 'place,' how? = 'manner,' and so on. This is also true of the interrogative words in Hokan languages.

Quantifiers Structurally, the numerical systems of Hokan languages do not reflect a widespread practice among their speakers of calculating or counting large numbers of things. There are three widespread etyma that mean 'one' and/or 'only, alone.' There are three that mean 'three', and two that mean 'two' (The Oto-Mangean stock also shows multiple etyma for most of the low numerical values, and little evidence for numbers above five). Etyma with values above three are found only in Northern Hokan. The various words for 'two' in the Hokan languages do not all reflect a single unitary proto-Hokan etymon, and the invented word *Hok[an]* does not directly represent any of them, although such was Dixon and Kroeber's intention.

Word Order The following remarks are based on a structural survey of certain languages only: Pomo (p.c. Oswalt, McLendon), Chimariko (TK), Yana (p.c. Hinton), Salina (p.c. Turner), and Yuma (p.c. Hinton, Langdon). Before much more can be done in this area, syntactic descriptions of Karuk (Bright), Shasta (Silver), Washu (Jacobsen), and Seri (Marlett) will have to be consulted, and descriptions of Achumawi, Atsugewi, Chontal, and Tol will have to become available.

Sentence-level Constituents On the level of the sentence, SOV word order is attested from Pomoan, Chimariko, Yuman, and Seri, and proto-Hokan probably had this order as well. Yanan has VSO, and Salina has VOS.

Noun Phrase Within the NP, the modifying adjective probably originally followed the noun it modified. Pomo, Chimariko, Yuman, and Seri all attest this, though Salina has AN order. As is well-known by now, NA order is neutral with respect to OV or VO constituent order, and not unharmonious with OV order.

There are two kinds of possessive constructions: one where the possessor [G] is an NP and one where it is a first or second person pronoun [Pn]. Several languages distinguish between intimate and casual possession or between kin terms vs. all other possessed nouns. The first type of possession in each case is marked by in several groups by prefixing or preposing a pronoun marker directly to the noun (Pom, Chi, Cho). The second type of possession is often marked by Pn-objective case # N (Pom, Yum). 'Objective case' is variously accusative, genitive, and benefactive in the various languages. When G is an N or NP it is preposed to the possessed N (in Pom, Chi, Sal, Yum, Ser). The possessor N(P) is case-marked objective (in Pom, Yum) and the possessed N is marked to agree for person of possessor (in Chi, Sal, Ser).

(6) G-obj/ben # N [Pom]
G # N-his [Chi]
G #his-N [Sal, Ser]
Pn-acc # N [Yum]
Pn-N [Pom (kin terms only; otherwise like G . . .N), Sal, Ser]
Pn:Erg-class-poss-N [Cho]
Pn:Neu-N [Chi (intimate possession)]
N-Pn:Act [Chi (casual possession)]

Proto-Hokan probably had postpositions, judging from the evidence of Pomo, Yuman, and Seri. These morphemes are not obviously related to nouns in most present-day languages (although they are in Seri), but their nominal origin is often apparent in etymologies that span the stock.

With the exception of the NA order, all of the word-order traits discussed above, as well as the positioning

of the TAM and case markers, are shared by proto-Yuta-Nawan, and – for all I know – proto-Penutian. These facts should not be taken as supporting either diffusion or genetic relationship between the three stocks; although either or both might be the case, they are not necessarily involved; these are morpho-syntactic phenomena that are quite typical of languages with OV syntax, and are found as well in Eurasia (e.g., Turkic family) and South America (e.g. Quechwa [Quechua] family). On the other hand, incorporated instrumental prepounds and directional postpounds are entrenched in Hokan, but sporadic in Yuta-Nawan (instrumental prefixes in Numic family only) and Penutian (instrumental prefixes and directional suffixes in Maidu, Klamath, and Sahaptian – hardly the 'Penutian kernel').

Viability

In pre-Columbian times most Hokan-speaking populations were nonagricultural, communities were small, and the total population for each language was under 10 000. At present most Hokan languages are dwindling (obsolescent – not being learned by children) or dying (moribund – spoken only by elderly people); several are dead already (marked with % in the classification). Since 1500, Tols and Chontals have become agriculturalists, but Tol is obsolescent, and few children are learning Chontal.

Robert Holcot (Holkot) was born near Northampton, England c. 1290. Joining the Dominican order, he arrived at Oxford and would remain there as student and then teacher from 1326–1332. Holcot may have served in the capacity of Dominican regent master at Oxford until being called to the post of clerk for Richard de Bury, Bishop of Durham. In 1343, Holcot returned to Northampton and lived in the priory there until his death of the bubonic plague in 1349.

Dominican training at the time of Robert Holcot's education would have likely included the study of logic, grammar, philosophy, and theology. His training on the differences between faith and reason would have followed the teaching of Saint Thomas Aquinas. Holcot himself was more a follower of William of Ockham than of Aquinas. In fact, although not fully agreeing with Ockham on matters of epistemology with regards to intuition and abstraction, Holcot used other fundamental principles from the teachings and writings of Ockham as a basis for his religious philosophy.

Holcot tried to reconcile the impassable differences between logic and faith. Since the principle of non-contradiction is fundamental to a logical progression of thought, it is difficult to reconcile the Christian belief that God is omnipotent within the framework of that logical progression. For instance, 'If God is omnipotent, can God create a rock so big that even God can't move it?' For Holcot, the answer was that natural laws with regard to logic and the limitations of our own human language must not apply to God. There must be, in addition to Aristotelian logic, which is applicable to the natural order, a separate logic of faith that is applicable to God.

Also problematic for the faithful Christian was the notion of future contingents with regard to divine omniscience. In other words, if God knows all things and any contingency is able to either exist or not, God cannot have foreknowledge of something that is inherently contingent. Holcot reconciled this disagreement between the logical and the theological by arguing that (simply put) if God is omniscient, the debate over whether or not he can know the nature of a future contingency is moot.

The written works of Robert Holcot include his comments on Peter Lombard's *Sentences*. Written while at Oxford, Holcot's 'Comments' on the *Sentences* are considered to be his most famous work. His *Sermo finalis*, given at the end of his tenure at Oxford, employs double entendre, or puns, to address his disapproval of his successor. Also of importance, the *Sex articuli* is both a comment on epistemology and a criticism of Holcot's contemporaries. It is possible that the *Sex articuli* was intended to appear together with his comments on the *Sentences*. Other important works include comments on Matthew,

og Minne. She wrote and edited 10 scientific monographs, including work on texts from the Middle Ages, all within her broad field of research. In addition, Anne Holtsmark wrote 120 articles for the *Kulturhistorisk leksikon for nordisk middelalder* (Culture historical lexicon for the Nordic Middle Ages). She was one of the founders of the Old Norse Dictionary Association (Gammelnorsk Ordboksverk) and the Association for Norwegian Culture Research (Forening til Norsk Kulturgransking). From 1941, Holtsmark was a member of the Norwegian Scientific Academy. She received the Royal Norwegian Order of Saint Olav and the Icelandic Falke-order for her lifetime work.

Holtsmark's main interest was the medieval language and its sources in literary texts, and she ranks among the most important Scandinavian philologists, especially for medieval studies. In her scientific work, Holtsmark maintained a broad scope, including linguistics, literature studies, and broader cultural studies. She also worked in fields combining all disciplines, and she presented results not possible without considerable knowledge of all these fields. In all of her work, Holtsmark was known to be very accurate. She based her results on a very exact text analysis, be it literary or linguistic research. For this reason, Holtsmark's work is still of great importance for current medieval research in Scandinavian Studies. Anne Holtsmark died on May 19, 1974.

Homans, George C. (1910–1989)

W A Hass, St Peter, MN, USA

© 2006 Elsevier Ltd. All rights reserved.

George Homans was a pioneer of sociological exchange theory. Born in Boston, in the Back Bay area, Homans was the son of a prominent physician; his mother was a member of the famous Adams clan. He attended the St Paul's School, Concord, New Hampshire, and Harvard (B.A., 1932). He became well acquainted with Pareto's work just after graduation, and took up sociological investigations as a Harvard junior fellow. His teaching career began and continued in sociology at Harvard (1939–1980), with time out during World War II to serve as a naval officer, returning to the Department of Social Relations there in 1945 until the end of his scholarly career.

Homans devoted his intellectual efforts to explaining social behavior, or, in slightly different terms, to basing social sciences on propositions from behavioral psychology. Language plays no particular overt role in his conceptualization; rather than focus on verbal communication he turned to interpersonal interaction, especially exchange. His fundamental principle is that of instrumental conditioning, or less psychologically, the social feedback loop. Accordingly, in his 1961 *Social behavior*, his first general proposition is: "If in the past the occurrence of a particular stimulus-situation has been the occasion on which a man's activity has been rewarded, then the more similar the present stimulus-situation is to the past one, the more likely he is to emit the activity, or some similar activity, now" (p. 53).

His analysis of human interaction, which can be seen as a modern version of hedonism or utilitarianism, is found implicitly in his *English villages of the 13th century* (1941). It is demonstrated explicitly, but still predominantly inductively in his *Human group* (1950), which approaches various specific face-to-face social phenomena in behavioral terms. These include the Western Electric Hawthorne Works in Chicago, an East Coast slum gang, Tikopia families, a New England village, and an electrical equipment company. These groupings allow him to point out issues in social organization, which offer paradigms for understanding society on a larger, institutional and cultural scale as well.

Homans then went on to formulate more general behavioral principles, in terms of rewarded activities, and the exchanges in which they are involved, and to

show their applicability to a wide range of social phenomena. Interactions of different sorts serve as special cases of the same underlying behavioral dynamics, although the empirical and logical adequacy of his formulations, while generally evident, is not necessarily well motivated conceptually or factually compelling. For instance, reward tends to increase the frequency of rewarded behavior (as indicated above), but also tends to become decrementally effective because of satiation.

The same principles of exchange could have been brought to bear on features of language structure, variation, and change, had Homans been interested. The linguistics of the time tended to emphasize the descriptive structure of texts or the cognitive equipment of the speakers. Whether his interactive account would have fared better than that of his psychological colleague, B. F. Skinner, who did sketch out a theory of verbal behavior, based on individual operant principles, could hardly be anticipated *a priori*, but the very lack of attempts to carry it out tends to raise one's doubts, especially given the subsequent rise of cognitive psychology, which tends to undercut it from the outside.

It is to Homans's outstanding merit that he stated his exchange theory so generally, basing it on psychological experimentation of then current learning theory, and related it in detailed and insightful ways to a great variety of actual social activities. His principles have been adopted in guiding real-life sociopolitical policies to a degree never achieved by more mathematically sophisticated linguistic grammars.

Honduras: Language Situation

J DeChicchis, Kwansei Gakuin University, Sanda, Japan

© 2006 J DeChicchis. Published by Elsevier Ltd. All rights reserved.

A crossroads of North American, Meso-American, and South American languages, Honduras has been home to indigenous Mayan, Uto-Aztecan, Misumalpan, Chibchan, and Arawakan languages, in addition to the colonial languages Spanish and English, and an English-based creole language. Spanish, the official language of government and the primary language of education, is also the most widespread lingua franca. However, in some areas, Spanish is often not spoken by the less educated Hondureños, and illiteracy is common. English, widely used in urban areas and in the department of Islas de la Bahía (e.g., Roatán), is the most popular foreign language.

The Spanish of Honduras has many Caribbean features, much more so than the Spanish of Guatemala or El Salvador. The loss of final [s] is especially prominent, even in the speech of university graduates. Indigenous language loss in favor of Spanish has accelerated in recent years, and the rate of Spanish monolingualism in western Honduras is very similar to that of El Salvador and even southern Guatemala. Near the Maya ruins at Copán, for example, only a handful of the 5000 ethnic Chortí Maya in Honduras can actually speak the Chortí language. The local Spanish is peppered with Chortí words and phrases, but the colloquial daily use of Chortí has ceased. The ethnic Pipil have forsaken their Uto-Aztecan speech for Spanish (*see* **El Salvador: Language Situation**). Similarly, the rapid loss of the language Lena by the Lenca people in favor of Spanish has resulted in its extinction. The former classification of Lena (Lenca) as Macro-Chibchan is rejected by some scholars, but a proper classification remains elusive. The ethnic Tolpan too are now mostly monolingual Spanish speakers, and capable speakers of their mother tongue Tol (also known as Jicaque) now number only a few hundred in the most isolated villages. Once classified as a Hokan language, Tol is now considered to be a language isolate, in danger of extinction. Even the speakers of the Chibchan language Pech (also known as Paya), who number roughly 1000, are bilingual in Spanish, and young speakers are very rare.

The most robust indigenous languages in Honduras are those with healthy speech communities in other countries as well. Forty thousand speakers of Mískito

show their applicability to a wide range of social phenomena. Interactions of different sorts serve as special cases of the same underlying behavioral dynamics, although the empirical and logical adequacy of his formulations, while generally evident, is not necessarily well motivated conceptually or factually compelling. For instance, reward tends to increase the frequency of rewarded behavior (as indicated above), but also tends to become decrementally effective because of satiation.

The same principles of exchange could have been brought to bear on features of language structure, variation, and change, had Homans been interested. The linguistics of the time tended to emphasize the descriptive structure of texts or the cognitive equipment of the speakers. A crossroads of North American, Meso-American, and South American languages, Honduras has been home to indigenous Mayan, Uto-Aztecan, Misumalpan, Chibchan, and Arawakan languages, in addition to the colonial languages Spanish and English, and an English-based creole language. Spanish, the official language of government and the primary language of education, is also the most widespread lingua franca. However, in some areas, Spanish is often not spoken by the less educated Hondureños, and illiteracy is common. English, widely used in urban areas and in the department of Islas de la Bahía (e.g., Roatán), is the most popular foreign language.

The Spanish of Honduras has many Caribbean features, much more so than the Spanish of Guatemala or El Salvador. The loss of final [s] is especially prominent, even in the speech of university graduates. Indigenous language loss in favor of Spanish has accelerated in recent years, and the rate of Spanish monolingualism in western Honduras is very similar to that of El Salvador and even southern Guatemala. Near the Maya ruins at Copán, for example, only a handful of the 5000 ethnic Chortí Maya in Honduras can actually speak the Chortí language. The local Spanish is peppered with Chortí words and phrases, but the colloquial daily use of Chortí has ceased. The ethnic Pipil have forsaken their Uto-Aztecan speech for Spanish (*see* **El Salvador: Language Situation**). Similarly, the rapid loss of the language Lena by the Lenca people in favor of Spanish has resulted in its extinction. The former classification of Lena (Lenca) as Macro-Chibchan is rejected by some scholars, but a proper classification remains elusive. The ethnic Tolpan too are now mostly monolingual Spanish speakers, and capable speakers of their mother tongue Tol (also known as Jicaque) now number only a few hundred in the most isolated villages. Once classified as a Hokan language, Tol is now considered to be a language isolate, in danger of extinction. Even the speakers of the Chibchan language Pech (also known as Paya), who number roughly 1000, are bilingual in Spanish, and young speakers are very rare.

The most robust indigenous languages in Honduras are those with healthy speech communities in other countries as well. Forty thousand speakers of Mískito

(Miskitu) live in the department of Gracias a Diós, and several hundred speakers of Sumo Tawahka live along the Patuca River or scattered through Gracias a Diós and Olanco. These Misumalpan languages are also spoken by even larger communities in Nicaragua. The two languages are often in contact, and in such cases a bilingual Sumo typically speaks Mískito.

The speakers of the Arawakan creole language Garifuna are even more international. Half of the world's quarter million Garinagu (of various Garifuna-speaking competencies) speakers live in Honduras, along the northern coast and, to a much lesser extent, on the Bay Islands. These people are well known as sojourners of the Caribbean and have communities in Belize, Guatemala, and elsewhere. Many of the males who travel for work speak English as well as Spanish, but the home use of Garifuna remains robust in Honduras.

Roatán and the other Bay Islands, as well as small parts of the northern coast of the mainland, are home to well over 10 000 first language speakers of Bay Islands Creole English. These speakers recognize British English as their standard, though their colloquial speech is a dialect of Western Caribbean Creole English. Beyond the Bay Islands, standard English is widely used among international workers and businessmen. In urban areas, there are English-language theatrical productions, and there is good availability of English-language radio and television programming.

Honorifics

M Shibatani, Rice University, Houston, TX, USA

© 2006 Elsevier Ltd. All rights reserved.

The term 'honorifics' refers to special linguistic forms that are used to signify deference toward the nominal referent or the addressee. The system of honorifics constitutes an integral component of the politeness dimension of language use, but whereas every language appears to have ways of expressing politeness, only certain languages have well-developed honorifics. Generally speaking, languages with highly developed honorifics systems are concentrated in Asia – Japanese, Korean, Tibetan, Javanese, and Thai are among the most familiar languages of this group. A thorough study of honorifics requires a two-pronged approach. The description of honorifics as grammatical forms is one approach and is relatively easy to accomplish, whereas the description of their actual use requires wider pragmatic as well as sociolinguistic perspectives, taking into consideration the elements of conversational situations, such as relationships between the speakers and the addressees, and the functional roles that honorifics play in communicative interaction. Though the pragmatic aspects of honorifics usage are gaining increasing attention in the field, descriptions are by and large purely grammatical, with little information on usage. This article endeavors to correct this imbalance by examining both the grammatical aspects of honorifics and the pragmatic and sociolinguistic issues; aspects of Japanese honorifics usage are particularly examined in some detail.

Referent Honorifics

'Referent honorifics', the most widely used grammatical form of honorifics, are used to show deference toward the nominal referents. Studies of the historical development of the honorifics system in the Japanese language indicate that referent honorifics are the most basic form of honorifics (*see also* **Japanese; Politeness**).

Titles

The commonest forms of referent honorifics are honorary titles used in conjunction with a name. Many languages have honorary titles; the English form *Mr* and the German form *Herr* derive from nouns designating higher social roles or divine beings. Also common are titles deriving from the names of kin terms or of occupations that are considered high in social

(Miskitu) live in the department of Gracias a Diós, and several hundred speakers of Sumo Tawahka live along the Patuca River or scattered through Gracias a Diós and Olanco. The description of honorifics as grammatical forms is one approach and is relatively easy to accomplish, whereas the description of their actual use requires wider pragmatic as well as sociolinguistic perspectives, taking into consideration the elements of conversational situations, such as relationships between the speakers and the addressees, and the functional roles that honorifics play in communicative interaction. Though the pragmatic aspects of honorifics usage are gaining increasing attention in the field, descriptions are by and large purely grammatical, with little information on usage. This article endeavors to correct this imbalance by examining both the grammatical aspects of honorifics and the pragmatic and sociolinguistic issues; aspects of Japanese honorifics usage are particularly examined in some detail.

Referent Honorifics

'Referent honorifics', the most widely used grammatical form of honorifics, are used to show deference toward the nominal referents. Studies of the historical development of the honorifics system in the Japanese language indicate that referent honorifics are the most basic form of honorifics (*see also* **Japanese; Politeness**).

Titles

The commonest forms of referent honorifics are honorary titles used in conjunction with a name. Many languages have honorary titles; the English form *Mr* and the German form *Herr* derive from nouns designating higher social roles or divine beings. Also common are titles deriving from the names of kin terms or of occupations that are considered high in social

standing (e.g., uncle, aunt, doctor, professor) or from ranks in specific social groups, such as military units (general) and business groups.

Honorific endings are similar to honorary titles; this grammatical form is used in Korean, Japanese, and other languages. The Korean suffix *-s'i* attaches either to the full name of a respected person or just to the family name of a person engaged in a menial labor, whereas the higher level ending *-nim* attaches to the combination of a family name and a professional title – e.g., *Kim kyoswu-nim* (Kim professor-SUFFIX) 'Professor Kim'. The Japanese ending *-san* and its higher level counterpart *-sama* attach to family names as well as to given names, yielding honorified forms – e.g., *Yamada-sama* 'Mr Yamada', *Masao-san* 'Masao (honorified first name)'. These are, in fact, part of the general amelioratory system of reference, which includes other endings such as *-kun* (used for the names of male equals or inferiors) and the diminutive *-tyan* (used typically for children's first names).

Pronouns

Pronominal forms, especially those referring to the addressee, namely, the second-person pronouns, are often the targets of honorific elaboration. The most well-known example of this is the use of plural pronouns, such as the forms for *you* (PL), *they*, and *we*, in reference to a singular addressee (or a third-person referent) as a sign of respect – French *vous*, German *Sie*, Russian *vy*, Tagalog *kayo* 'you.PL', *sila* 'they', Turkish *siz* 'you.PL', Ainu *aoko* 'we.INCL'. Javanese presents one of the most complex pronominal systems elaborated along the honorific dimension.

One notable aspect of honorifics having to do with the second-person pronominal forms is that many languages of Asia, e.g., Japanese, Korean, and Dzongkha (Bhutan), out of deference to a superior, simply avoid using these forms (see later, sections on Avoidance Languages and Forms of Honorifics). In these languages, the second-person reference, if the need arises, is made by the use of a professional title (e.g., Japanese *sensei* 'teacher', Korean *sacangnim* 'company president'), kin terms (e.g., Korean *emeni* 'mother'), or a combination of a kin term and an honorific ending (e.g., Japanese *ozi-san* 'uncle').

Nouns

Honorified nouns express deference either directly toward the referent or indirectly toward the owner, the creator, or the recipient of the referred object. As opposed to the first two categories of referent honorifics (titles and pronouns), there are far fewer languages with a system of honorified nouns. In languages in which honorified nouns are used, there are both suppletive and regular morphological processes as well as combinations of both. Korean nominal honorific forms *cinji*, *yonse*, and *songham* supplete *pap* 'meal', *nai* 'age', and *irum* 'name', respectively. Often suppletive honorific forms are loanwords borrowed from cultures of higher status. For example, the honorific forms *bida* 'father' and *manda* 'mother' for the native Thai words *po* and *me,* respectively, are from Pali. Likewise, many honorific forms in Javanese are loanwords from Sanskrit and Arabic – e.g., *arta* 'money' (Sanskrit) and *kuwatir* 'to fear' (Arabic).

Kin terms in Japanese are made honorific by the suffixation of honorific endings *-sama* or *-san*. There are degrees of respect: in comparing *o-kaa-sama* 'mother' and *kaa-san* 'mother', for example, the first form, with the honorific prefix *o-* and the *-sama* ending, is the more elevated form. Nominal honorific forms typically refer to objects possessed or created by respected persons. The favorite nominal honorific derivation in Japanese is constructed by means of the prefix *o-* or *go-* (e.g., *o-kaban* 'bag', *go-hon* 'book', *o-hanasi* 'talk', and *go-koogi* 'lecture'). A combination of suppletion and prefixation is observed in the Japanese form *o-mesimono* for *kimono* 'Japanese-style clothes' or *huku* 'Western-style clothes'.

The all-purpose Japanese nominal honorific prefixes *o-* (for native words) and *go-* (for Sino-Japanese loanwords) have their etymologies in words with meanings associated with greatness (for the native *o-*) and ruling (for the Chinese *go-*). Tibetan nominal honorific prefixes, on the other hand, have a classificatory scheme as their basis (Kitamura, 1974). Thus, the honorific form *bdu* for *mgo* 'head' functions as an honorific prefix for objects having to do with the head or upper/superior body part (e.g., *skra* 'hair' → *bdu-skra*, *zhwa-mo* 'hat' → *bdu-zhwa*). Likewise, the honorific forms *gsol* for *bzas* 'eat' and *btung* 'drink' go with objects having to do with foods and eating (e.g., *ito* 'food' → *gsol-chas*, *thab-tshang* 'kitchen' → *gsol-thab*).

Subject Honorifics

Just as the possession of something can be the target of honorification, a being or action can be honorified as a way of showing deference toward the referent of the subject nominal, namely, the actor. Of course, a subject nominal can be honorified by, for example, the choice of the second- or third-person pronominals (as previously noted), but the case under consideration involves alterations in verbal form. A case can be clarified by comparing a plain Japanese sentence, (1) *Tanaka ga ki-ta* (Tanaka NOM come-PAST) 'Tanaka came', and the honorific counterparts, (2) *Tanaka-kyoozyu ga ki-ta* (Tanaka-professor NOM come-PAST) and (3) *Tanaka-kyoozyu ga ko-rare-ta*

(Tanaka-professor NOM come-HON-PAST) 'Professor Tanaka came'. Sentence (2), with a professional title for the subject nominal, expresses a certain degree of deference toward the teacher. But a more appropriate form would be sentence (3), in which the verb also changes its form in accordance with the speaker's deference toward the referent of the subject.

Japanese, Korean, and Tibetan have a highly developed system of subject honorification. As shown in the preceding example, Japanese uses the passive/potential/spontaneous suffix *-(ra)re* attached to a verbal stem and derives the subject honorific verbal form: *ik-u* (go-PRES) 'go' → *ika-re-ru* (go-HON-PRES). Korean has the subject honorific suffix *-si* that attaches to a verbal stem: *o-ta* (come-IND) 'come' → *o-si-ta* (come-HON-IND). Tibetan uses the honorific form *gnang* for the verbs of giving and receiving as a productive subject honorific verbal suffix: *thugs* 'meet' → *thugs-gnang* (meet-HON), *bzos* 'make' → *bzos-gnang* (make-HON). In addition to these productive honorific forms, a fair number of suppletive subject honorific forms are also seen in all of these languages. The Japanese form *irassyaru* suppletes *iru* 'be', *iku* 'go', and *kuru* 'come'. *Khesi-ta* is the Korean subject honorific form of *iss-ta* 'be'. The Tibetan form *gnang* suppletes *ster* 'give', *btang* 'send', and *sprad* 'hand over'. In addition to these examples, Japanese has a circumlocution subject honorific form. This involves the following processes: (a) the conversion of the verbal complex into a nominalized form, (b) the attachment of the honorific prefix *o-/go-* to the nominalized form of the verbal complex, and (c) the predication of the subject by the verb *naru* 'become' together with the adverbial complement form of the nominalized verbal complex. This converts the sentence *Tanaka-kyoozyu ga aruk-u* (Tanaka-professor NOM walk-PRES) 'Professor Tanaka walks' to *Tanaka-kyoozyu ga o-aruk-i ni naru* (Tanaka-professor NOM HON-walk-NOMINALIZER DAT become), whereby the *o-aruk-ini* (HON-walk DAT) portion is the adverbial complement form of the nominalized verbal complex. Notice that this type of circumlocution is fully grammaticized in the sense that it is associated only with the honorific value, with no literal reading available. In fact, this grammaticization aspect is a basic defining characteristic of honorifics, distinguishing them from ordinary polite expressions such as English *Will you open the door for me?* and *Do you mind opening the door for me?*, which are still associated with literal meanings. The Japanese honorific prefixes *o-/go-* also attach to adjectival predicates, yielding the hird type of subject honorific form in the language – e.g., *Hanako wa utukusii* (Hanako TOP beautiful) 'Hanako is beautiful' → *Hanako-san wa o-utukusii* (Hanako-HON TOP HON-beautiful).

Humbling Forms

Deference toward a superior may be shown by humbling oneself or one's speech directed toward a superior. A fair number of languages have humbling first-person pronominals. The ordinary Thai first-person pronoun *chan* is replaced by *phom* or by the even more humbling form *kha* '(lit.) servant' or *kha cau* '(lit.) master's servant'. Korean *na* 'I' can be replaced by the humbling form *co*. In letter writing, a Japanese male may humble himself by referring to himself by the Chinese derivative *syoo-sei* '(lit.) small person'. In fact, the Japanese epistolary style contains a whole series of honorific/humbling noun pairs adopted from Chinese – e.g., *rei-situ* '(your) honorable wife': *gu-sai* '(my) stupid wife', *gyoku-koo* '(your) splendid piece of writing': *sek-koo* '(my) humble piece of writing'.

Less common are humbling verbal forms, which are sometimes called 'object honorifics', because they express deference toward the referents of nonsubject nominals by humbling the actor's action directed toward them. The Japanese humbling forms include both suppletive verbal forms (e.g., *sasiageru* and *o-me ni kakaru* for *yaru* 'give' and *au* 'meet', respectively), and a circumlocution, the latter being quite pervasive. The humbling circumlocution involves (a) the prefixation of the nominalized verbal form by the prefix *o-* and (b) the verb *suru* 'do'. This converts the plain form *Watasi wa Tanaka-kyoozyu o tazune-ta* (I TOP Tanaka-professor ACC visit-PAST) 'I visited Professor Tanaka' to *Watasi wa Tanaka-kyoozyu o o-tazune si-ta*. Tibetan also has a number of suppletive humbling forms of verbs – e.g., *thugs* 'meet' → *mjal*, *ster* 'give' → *phul*: *Nga pa-pha dang thugs byung* (I father.PLAIN with meet PAST) 'I met (my) father (plain)' → *Nga pa-lags dang mjal byung* (I father.HON with meet.HUM PAST) 'I met (my) father (humbling)'.

Subject honorification and the humbling processes are controlled by the referents of different nominals – the former by the subject nominal and the latter by the nonsubject nominal – and thus they can be, in theory, combined. Indeed, such a combination appears possible in Tibetan (Kitamura, 1974). As in the Tibetan example, the word *mjal* 'meet' is the humbling form, expressing the speaker's deference toward the person to be met. Recalling that *gnang* is the productive subject honorific form, the combination of *mjal* and *gnang*, *mjal gnang*, thus expresses the speaker's deference to both the person who is meeting someone and the one who is met – *Pa-lags sku-mdun dang mjal gnang song* (father.HON Dalai Lama with meet.HUM HON PAST) '*(My)* father met Dalai Lama (humbling-subject honorific)'. In the case of modern Japanese, however, such a combination of a subject

honorific form and a humbling form is generally avoided, and, when the occasion arises, simply a subject honorific form alone is used: *Tanaka-kyoozyo ga gakubu-tyoo ni o-ai ni natta* (Tanaka-professor NOM dean DAT HON-meet DAT became) 'Professor Tanaka met with the dean (subject honorific)'.

Addressee Honorifics

Addressee honorifics are those forms that show the speaker's deference toward the addressee. In the case of honorific second-person pronouns, the reference honorific function and the addressee honorific function converge, but certain languages have special addressee-oriented honorific forms. Perhaps the most familiar is the use of *sir, ma'am,* etc. in English, as in, *Yes, sir* or *Thank you, ma'am*. Many languages mark addressee honorifics by the use of particles: Tagalog *po*, Thai *kha* (for female speakers), *khrap* (for male speakers) Tamil *nka*, *lii*.

More elaborate systems are found in Korean and Japanese, both of which have special verbal endings. Korean and Japanese attach the suffixes *-sumni* and *– mas*, respectively. Notice that subject honorifics and addressee honorifics are again two independently parameterized systems, and therefore that one can, in principle, occur independently of the other. Thus, the Japanese subject honorific form *Tanaka-kyoozyu ga ika-re-ru* (Tanaka-professor NOM go-S.HON-PRES) 'Professor Tanaka goes' can be used by itself between two students. The subject honorific ending- *(ra)re* (S.HON) can then be combined with the addressee honorific ending *-mas* (A.HON), when the same sentence is uttered toward a respected person: *Tanaka-kyoozyu ga ika-re-mas-u* (Tanaka-professor NOM go-S.HON-A.HON-PRES). When the subject referent is not appropriate for showing the speaker's respect, only the addressee honorific form can occur, as in *Watasi ga iki-mas-u* (I NOM go-A.HON-PRES) 'I go'. In Japanese, even further respect toward the addressee can be shown by the use of humbling verbal forms. The sentence *Watasi ga iki-mas-u* can be made even politer by suppleting the verb *iku* 'go' by the humbling equivalent *mairu*, as in *Watasi ga mairi-mas-u*.

Avoidance Languages

The use of honorific forms may be conditioned by persons who are in the vicinity of a speaker, especially when a respected person being talked about is within earshot. Thus, a Japanese student who normally utters a plain form such as *Sensei ga ki-ta* (teacher NOM come-PAST) 'The teacher came' might use the subject honorific form *Sensei ga ko-rare-ta* when he notices the presence of the teacher in question.

Much more regulated forms of bystander honorifics are seen among the Australian aboriginal languages. A variation of the language, known as the 'mother-in-law' or 'brother-in-law' language, is used specifically in the presence of certain 'taboo' kin. In the case of the mother-in-law language of Dyirbal, a speaker must switch from the 'everyday' language, Guwal, to the mother-in-law language, Dyalnguy, when a taboo relative, e.g., a parent-in-law of the opposite sex, appears within earshot. Dyalnguy is in fact part of the avoidance behavior between certain taboo relatives that was once strictly observed in Australian aboriginal societies. A son-in-law avoids speaking directly to his mother-in-law, and the mother-in-law must use Dyalnguy in speaking to her son-in-law (Dixon, 1972). In Guugu Yimidhirr society, neither a male nor his mother-in-law can speak to each other directly, and, accordingly, the avoidance language is more like a 'brother-in-law' language, the form used typically when a male speaks to his brother-in-law or father-in-law (Haviland, 1979).

Avoidance language has an honorific function as well. In Guugu Yimidhirr, the brother-in-law language is to be used with kin who must be treated with respect. It is spoken slowly in a subdued voice, accompanied by a behavioral pattern of avoidance, effacing the addressee directly, e.g., by sitting sideways with some distance maintained. The Guugu Yimidhirr brother-in-law language also has linguistic features of honorific languages. For example, the everyday second-person plural pronoun *yurra* is employed as a second-person singular pronoun, as in the case of Russian *vy* and French *vous*. Honorifics often neutralize semantic distinctions made in ordinary words, and so does the Guugu Yimidhirr brother-in-law language. The polite second-person pronoun *yurra* 'you' neutralizes the distinctions among the singular, the dual, and the plural forms. With various suppletive forms, certain brother-in-law expressions show a marked difference from the everyday language: e.g., *Nyundu buurraay waami?* (you water found) 'Did you find water?' (everyday) → *Yurra wabirr yudurrin* (you water found) 'Did you find water?' (brother-in-law).

Speech behavior involving avoidance languages is akin to that of honorifics languages such as Javanese and Japanese in three other respects. Voice modulation is also seen in Javanese honorific speech, wherein "the higher the [honorific] level one is using, the more slowly and softly one speaks" (Geertz, 1968: 289). In the feudal society of Japan, inferiors were not permitted to speak directly to their superiors of the highest rank in close proximity to them. Emperors received courtiers behind a bamboo screen, and warlords were addressed by vassals of lower rank only from some

distance away. Avoidance of superiors is also manifested in the use of second-person pronouns and names. In languages such as Japanese, Korean, and Dzongkha, the use of second-person pronouns is avoided in addressing superiors. Japanese, for example, has a polite second-person pronominal form *anata* or the even more honorified form *anata-sama*, but these can never be used in addressing a superior; the form *anata-sama* is marginally usable in a highly impersonal situation. Likewise, in Japanese and many other societies (e.g., traditional China, Igbo), inferiors cannot use the given names of certain superiors in addressing them.

One of the parameters that determines the use of honorifics is the social and psychological distance between the interlocutors (see later, Use of Honorifics). The avoidance languages of Australia and similar speech behaviors in honorifics languages clearly point out this correlation, which is often reinforced by physical distance.

Beautification

Japanese has extended the honorific prefixes *o-/go-* to other uses wherein no respect for the referent, e.g., the possessor of the designated object, or for the addressee is intended. Thus, the prefixes may be attached to the nouns designating what belongs to the speaker or to no particular person; e.g., *watakusi no o-heya* (I GEN HON-room) 'my room', *o-biiru* 'beer', *o-nabe* 'cooking-pot'. This particular use of honorific prefixes is simply motivated by the speaker's demeanor and is called *bika-go* 'beautification language' in Japanese. The form is typically used by women, and accordingly those nouns that take beautification prefixes typically designate domestic matters such as household goods and foods.

Though beautification prefixes are not strictly honorifics, because they beautify even those nouns designating objects belonging to the speaker, their honorific origins are not entirely obliterated. The prefixes cannot be used for those nouns designating highly personal objects belonging to oneself, such as body parts. Even those who are prone to use beautification prefixes excessively would not use words such as *o-yubi* 'finger' or *o-asi* 'leg' in reference to their own fingers or legs, but they are perfectly appropriate as honorific forms used in reference to a respected possessor.

Form of Honorifics

Though the specific forms of honorifics vary considerably – some involving suppletion, others involving affixes or particles – it is possible to detect a certain general tendency in the formation of honorifics. The most basic characteristic is that honorific expressions avoid direct attribution of an action to the respected person, or sometimes to the speaker (out of humbleness in the latter case). Avoidance of speaking or avoidance of using second-person pronouns is an extreme case of this, but many languages use a special device for blurring the identity of an actor as a means of avoiding directness of expression.

The most widely adopted method of blurring or defocusing an actor is in terms of oblique referencing, which takes a number of forms. Less common than pluralization but an occasionally observed way of avoiding direct reference is the use of locational nouns and deictic expressions. The Japanese second-person pronominal *anata* 'you' has its etymology in the archaic expression *anata* 'yonder'. However, since this form has been fully grammaticized as a second-person pronominal, and since Japanese tends to avoid using second-person pronominals, the form *o-taku* 'HON-house' is often used as an honorific replacement for *anata*. Shifting person is another method of oblique referencing, as observed in Italian: *Lei va?* (she go) 'You (honorific) go?'. The most popular method of oblique referencing is in terms of shifting number from the singular to the plural. Polite plural pronominal forms are a case in point. Regarding the evolution of the honorific second-person plural forms in European languages, Brown and Oilman (1960) referred to a theory that attributes the polite use of the Latin plural form *vos* to the existence of the two emperors in the 4th century – one in Constantinople and the other in Rome. However, the widespread use of plural forms as second-person honorific pronouns in diverse languages such as Ainu (*see* **Ainu**), Tagalog (*see* **Tagalog**), Turkish (*see* **Turkish**), Guarijío (North America), and Guugu Yimidhirr indicates that the plurality in form has no direct connection to the concept of two emperors or to royalty. Pluralization is simply a favorite way of defocusing the identity of an actor across languages. Of course, only those languages that make a singular/plural distinction can exploit this method of agent defocusing. Indeed, if a language has plural verb forms, they may also be utilized as a means of subject honorification. For example, Ainu has plural verb forms that express the plurality of the affected object or the actor, and these plural forms may be used to express deference toward the referent of the subject nominal. The plural verb form *kor-pa* (have-PL) may mean either 'He/they have a lot of things' or 'He has something (honorific)'. Turkish also exploits the plural verb forms for honorific purposes: e.g., *Eşiniz daha gelmedi-ler mi?* (wife.your(HON) still arrive-PL Q) 'Has your (honorific) wife not yet arrived (honorific)?' and *Ali Bey*

orada-lar mi? (Ali-HON there-PL Q) 'Is Ali (honorific) there (honorific)?'.

In European languages, the role of plural agreement in the verb is not entirely clear. In the German and Russian languages, the choice of second-person plural subject forms for an honorific purpose automatically triggers verbal agreement – Russian *Vy* (PL) *videli* (PL) 'You saw'. The question is whether the plural verb form, independently of the plural pronouns, can be used as a mark of subject honorification. There are indications that in some European languages, plurality in the verb marks subject honorification, just as in the Turkish case; in Polish dialects (Comrie, 1975) an example is *Dziadek* (SG) *widzą* (PL) 'Grandfather sees (honorific)', and in a variety of German (Wolfgang Dressler, personal communication) there is *Sind* (PL) *der Herr* (SG) *schon bedient?* '(lit.) Are the Sir already served?'.

Some languages create a sense of oblique referencing by shifting case marking from the ordinary forms to special oblique markers. Korean particles *k'e* and *k'eso* are special honorific dative and ablative (archaic) particles, respectively. Japanese epistolary style replaces the normal nominative case particle *ga* for the subject nominal by the dative particle *ni* as a way of showing respect to its referent.

The passive construction effects agent defocusing, and an honorific expression is often derived in the development of the passive from the middle/spontaneous, as in the case of the Japanese subject honorific suffix *-(ra)re*, or in the development of the passive from the indefinite person construction, as in the case of Indonesian, wherein the passive prefix *di-*, which goes back to the third-person plural marker, also derives an honorific verbal form: e.g., *Silakan di-minum* (please HON-drink) 'Please drink'. Circumlocution-type honorifics observed in Japanese subject honorific and humbling forms are another way of avoiding direct attribution of the action to the respected agent or to the speaker. Shifting tense from the present to the past in polite speech, as observed in English (e.g., *Can you . . .?* → *Could you . . .?*, *Will you . . .?* → *Would you . . .?*) is analogous in method to oblique referencing and the circumlocution honorifics discussed here.

Honorific forms are marked as secondary forms, because they tend to be signaled by additional affixes or particles. The secondary nature of honorifics is seen even in suppletive forms from the fact they often do not make as fine semantic distinctions as do ordinary words. For example, the suppletive form *irassyaru* in Japanese obliterates the distinctions between *iru* 'be', *iku* 'go', and *kuru* come'. The Tibetan subject honorific form *gnang* and the humbling form *phul* neutralize the distinctions made between the ordinary words *sprad* 'hand over', *ster* 'give', and *btang* 'send'.

Finally, to a considerable extent, honorific expressions are iconic to the relevant social and psychological distances: the longer the form, the politer the expression. In the case of avoidance languages and some honorifics languages, physical distance accompanies honorific speech.

Distribution and Development of Honorifics

Among the various honorific forms in languages, certain types are more widely observed than others, and historically, certain forms change their category from one type to another. Synchronic distribution and historical development seem to be correlated to a great extent. More languages include referent honorifics, compared to addressee honorifics, and among referent honorifics, subject honorifics are more widely distributed than are humbling, nonsubject honorifics.

The fact that use of referent honorifics is more widespread than use of addressee honorifics is may seem strange in view of the fact that in conversation the addressee is more directly involved than the nominal referent is, and is accordingly expected to be a likelier target of the speaker's deference. However, the referent honorific system serves the function of the addressee honorific system when the subject referent and the addressee converge, as in the expression of *Are you leaving now?*. Thus, a referent honorific system is a useful system that allows the speaker to express deference, not only to a third-person referent, but also to the addressee as well. Whereas Japanese, Korean, Thai, and Javanese have both referent and addressee verbal honorifics, Tibetan and Dravidian languages appear to have only well-developed referent verbal honorifics. Unlike Japanese, Korean does not have a systematic humbling, or nonsubject, honorific system, and even among the Japanese dialects, e.g., Miyazaki, there are many that lack a systematic humbling verbal mechanism. In the diachronic dimension, the history of Japanese reveals that referent honorifics were more prevalent than addressee honorifics in 8th-century Japanese. Subject honorifics often give rise to humbling verbal forms, which in turn supply new addressee honorific forms.

Use of Honorifics

A more challenging aspect of the study of honorifics is the description of the actual use of honorifics in speech situations – e.g., who uses honorifics, whom they are used in reference to, and what their functions

are in communicative interaction. Since addressing these issues requires knowledge of actual speech situations in some detail, the focus here is on a single language, namely, Japanese, though preliminary remarks on some general concepts are in order. In the case of the avoidance languages of Australia, use of honorifics seems to be controlled rigidly according to the tribal membership and genealogical relationships that determine for each speaker which kinsmen (e.g., mother-in-law, brother-in-law) are taboo, and which are to be avoided and treated deferentially. Notice again that the notions of avoidance and of deference converge in the use of a special language. Indeed, the use of honorific speech in general is controlled by the social and psychological distance among the interactants.

Power and Solidarity

Brown and Oilman (1960), in a seminal work, identified two factors – 'power' and 'solidarity' – that determine social and psychological distance relevant to the use of honorific speech. Power, as determined in each culture according to social class, age, sex, profession, etc., establishes the superior–inferior relationship that characterizes a vertical social distance – the greater the power difference is, the greater the social distance is. Solidarity, on the other hand, determines a horizontal psychological distance. Those having the same or similar attributes (e.g., power equals; members of the same family, profession, or political persuasion) are solidaristic or intimate and short in psychological distance, whereas those that do not share attributes (e.g., power unequals; strangers) are distant. Brown and Oilman showed that these two differently defined parameters of distance are correlated with the use of pronouns in European languages (e.g., French *tu* vs. *vous,* German *du* vs. *Sie*). Owing to the work of Brown and Oilman (1960), the former, plain forms of pronouns are now customarily referred to in the literature as 'T-forms' and the latter honorific forms are referred to as 'V-forms.'

Power-based honorifics and solidarity-based honorifics reveal a difference in the reciprocity of the forms used among interactants. As in the case of German *du* used among intimates and *Sie* used among strangers, the solidarity-based honorifics are formally symmetric or reciprocal, whereas a strictly power-based system is nonsymmetric or nonreciprocal in that the inferior is obliged to use thex honorific forms (the V-forms) toward the superior, who returns the plain forms (the T-forms). Brown and Oilman showed that in the case of T/V variation in Europe, it was largely controlled by the power relationship until the middle of the 19th century, whereas in the 20th century solidarity has become a dominant factor.

Power-Based Honorific Pattern

Japanese honorific speech shows both power-based and solidarity-based aspects. When superiority is fairly rigidly determined, as in a business organization, and when the rank and age difference are major determinants of superiority, the power-based, nonreciprocal pattern is observed; an inferior consistently uses honorifics toward a superior. A superior might thus invite his subordinate for a drink by using plain form, (1) *Konban nomi ni ikoo ka* (tonight drink to go Q) 'Shall we go drink tonight?'. The subordinate must reply in the addressee honorific form, (2) *Ee, iki-masyoo* (yes go-A.HON) 'Yes, let's go', and must never reply in the plain expression, (3) *Un, ikoo* 'Yeah, let's go', which is appropriate only to his inferior or equal. When the subordinate asks his superior out, the reverse pattern obtains; the subordinate cannot use form (1) and must use its addressee honorific version, (4) *Konban nomi ni iki-masyoo ka* 'Shall we go drink tonight?', and his superior is most likely to reply with the plain form (3). As far as the inferior is concerned, this pattern of exchange must be maintained even if he and his superior are quite intimate and can converse quite informally. The mutual use of plain speech between non-equals is permitted only in an unusual circumstance, such as during the late hours of a drinking party, when all the formalities might be done away with.

Solidarity-Based Honorific Pattern

Whether a superior uses honorifics toward an inferior depends on a number of factors. Among these, a major factor is psychological distance or degree of intimacy. Though the use of plain or rough speech motivated by power on the part of a superior is occasionally encountered, it is becoming increasingly rare in contemporary Japanese society to see the power-based use of plain form – a major exception being a scene of conflict or dispute between power unequals, e.g., between an angry customer and a sales clerk. This trend is due to several factors. When a superior uses plain forms toward an intimate subordinate, it is a mark of intimacy, whereas use of honorific speech creates a distance and is a sign of formality. In other words, a superior's use of honorifics is solidarity based; honorifics are used (as in form (4) in the preceding section) when a superior and a subordinate are not very intimate, whereas plain speech (e.g., form (1)) is directed toward the subordinate as a sign of solidarity, whereby the sense of camaraderie is engendered. Notice, however, that between power unequals, only a superior has the option of using plain forms – inferiors must always use honorifics – unlike the mutual T-form exchanges in Europe. (Even

in Europe, it is power superiors who can initiate the reciprocal T.) Between power equals, the plain/honorific variation is by and large controlled by the solidarity factor; plain forms are used among intimates to confirm camaraderie, whereas honorifics are used between less familiar persons and strangers as a means of keeping psychological distance, by way of which the addressee's personal integrity is honored. In the majority of contemporary Japanese households, the solidarity factor has primacy over the power factor, and thus parents and children, and elder siblings and younger ones, also exchange plain forms, much like the use of *du* within the contemporary German family. This linguistic manifestation of the Western egalitarian ideology was introduced to Japan in the middle of the 19th century and it spread throughout the country after World War II.

China has witnessed perhaps the most dramatic effect of the egalitarian ideology on honorifics. The socialist revolution in 1949 and the cultural revolution of the 1960s wiped out the traditional social classes, and with the demise of the aristocratic and the elite classes, once-flourishing honorifics too were all but obliterated. The other manifestation of the egalitarian ideology is the use of honorifics on the part of power superiors, as described previously. Even Emperor Akihito of Japan uses honorifics when he addresses an ordinary citizen. Thus, the egalitarian ideology has facilitated the growth of reciprocal solidarity-based use of honorifics in Japanese as well. However, the reciprocal speech pattern can in principle go in either direction: toward the symmetrical honorific pattern or toward the symmetrical nonhonorific, plain pattern. As noted previously, the Chinese language has taken the path to the latter. Besides the solidarity factor, there seems to be another prevailing factor at work in languages that display the reciprocal honorific speech pattern.

Demeanor

Nonreciprocal plain/honorific exchanges can be observed in some Japanese families, especially between husband and wife and/or between parents and adult children (daughters in particular). The motivation for such an exchange seems hardly to be power based: instead, what underlies speech patterns observed in those families is the idea of proper language usage, which prescribes that superiors be treated deferentially through honorific speech. After all, honorifics are consciously taught and learned by the Japanese with this kind of prescriptive idea. This conscious teaching and learning of honorifics and their historical connection to the nobility has produced a situation in which appropriate honorific usage is regarded as a mark of good breeding.

The use and nonuse of honorifics as indications of class membership have the effect of making the use of honorifics part of the speaker's self-presentation effort, an aspect of what sociologist Erving Goffman (1956; *see* **Goffman, Erving (1922–1982)**) calls 'demeanor'. That is, though correct honorifics usage has the effect of paying respect to the addressee, it is at the same time a way of presenting the speaker as a cultivated person of good demeanor. The demeanor aspect of honorifics usage also has the effect of producing the reciprocal honorific speech pattern; speakers who have the prerogative of using either plain or honorific speech – as in the case of the Emperor, or power superiors in the business world, or professors in academic life – may constantly use honorifics as a way of self-presentation. An extreme manifestation of this in Japanese is the excessive use of the beautification prefixes *o-/go-* by women, whereby the level of politeness is at times consciously elevated to an absurd level.

Formality

Though the goal here is to isolate and delineate those factors that determine the use and nonuse of honorifics, these grammatical forms of language do not in reality occur in isolation. In an actual speech situation, all of the factors that control speech form are typically compounded. Take the notions of solidarity and of demeanor previously discussed: when a woman shops in an elegant boutique in Ginza in downtown Tokyo, she is likely to use honorifics, as in *Motto ookii no o-ari ka sira?* (more large one HON-have Q wonder) '(I) wonder if (you) have a larger one? (honorific)', as opposed to a plain form such as *Motto ookii no aru?* (more large one have Q) '(Do you) have a larger one? (plain)', which might be used when she is shopping in a neighborhood grocery shop. Here, it is likely that both solidarity and demeanor factors are at work. In addition, the formality factor involved in the former situation cannot be ignored.

Formality overrides all of the considerations previously discussed and requires the use of honorifics on the part of all of the concerned parties. Thus, power-equal colleagues, who normally exchange plain forms, would exchange honorifics in a formal meeting or on ceremonial occasions. Other factors contributing to the formality of the speech setting include the nature of the topic of conversation and the turns of conversation that occasion formality, such as the opening and closing of a new topic. One clear instance whereby the formality factor alone dictates the use of honorifics is letter writing. Letter writing is a formal activity, being associated with a long history of a variety of epistolary styles, and it triggers the use of honorifics even if the letter is addressed to an intimate

person. For example, a son, who usually uses plain forms to his mother, would write to his mother in the honorific style: on the telephone, he would say to his mother *Raisyuu kaeru yo* (next week return PART) '(I'll) come home next week, all right? (plain)', but he would write, *Raisyuu kaeri-masu* in the addressee honorific style.

Relativity of Social Distance

One final characteristic of Japanese honorific usage to be discussed here has to do with the relativity of the social distance of a nominal referent. The use of both subject honorifics and humbling forms is essentially determined by the social and psychological distance between the speaker and the nominal referent. A subject-honorific form would be used when the subject referent is a superior, or a humbling form would be used when an action is directed toward a superior. When this kind of pattern is absolutely maintained, regardless of the nature of the addressee, as in the case of the Korean honorific system, then a so-called absolute honorifics system exists. The Japanese honorific system differs from this in that the group identity of the addressee enters into the picture of proper honorific usage. Japanese society makes a rather clear division between those who belong to a social group and those who are outside. With respect to outsiders, insiders are treated as an extension of oneself. One consequence of this in regard to honorifics usage is that, with respect to outsiders, status differences among the members of a given social group are obliterated and members are identified with the status of the speaker. Accordingly, when speaking to an outsider, honorifics would not be used with respect to a member of the social group, e.g., family members or colleagues in a business firm; humbling forms would be used instead, even with respect to the superior's action. For example, a secretary would normally use honorifics with respect to her boss when she speaks to her colleagues, as (1) *Syatyoo wa soo ossyatte imasu* (company-president TOP so say.S.HON be.A.HON) 'The company president says so (subject honorific, addressee honorific)'. However, when she is speaking to someone from outside her company, she would treat her boss as if the boss were herself and would use humbling forms, as (2) *Syatyoo wa soo moosite orimasu* (company-president TOP so say.HUM be.HUM.A.HON) 'The company president says so (humbling, addressee honorific)'. Thus, in Japanese, with its relative honorifics system, the interpretation of honorific value is not as straightforward as in absolute honorifics languages such as Korean and Tibetan, in which the type (l) honorific form is consistently used regardless of the addressee. That is, in Japanese, the interpretation of the honorific index must take into account not only the usual relationships among the speaker, the nominal referent, and the addressee, but also whether the addressee is an insider or outsider with respect to the speaker's social group.

Conclusion

Human interaction is facilitated by minimizing conflict between interactants. One of the ways in which conflict arises is by mistreating people such that they feel that their personal integrity is threatened, that the expected camaraderie is not confirmed, or that the deference that their social standing has earned them has not been paid. Potential conflict is therefore removed when clarification of the relationships of the involved parties is made, and when they are maintained and reinforced with attendant protocols throughout an interaction. Human behavior, verbal or otherwise, is polite to the extent that it satisfies these requirements for facile interaction. Honorifics permit the speaker to express his relationship to the addressee and to the nominal referent in a highly codified manner. They indicate a speaker's recognition of the power and personal integrity of the person spoken to or talked about, and conversely they indicate a speaker's social and psychological position in relation to the involved parties. Thus honorifics remove potential conflict and facilitate communication. It is precisely because of this function of honorifics in smooth communicative interaction that they instantiate a prototypical case of politeness phenomena of language use, and this in turn inspires a study of honorifics within the framework of general theories of linguistic politeness, a field gaining increasing attention thanks to works such as Lakoff (1975) and Brown and Levinson (1987).

Apparently, all languages, regardless of the degree of elaboration in the honorifics system, have ways of making speech behavior polite. An interesting issue therefore is what difference, if any, possession of a highly elaborate honorifics system entails in the communicative function of languages. The relevant research, such as that of Hill *et al.* (1986), indicates that honorifics languages are more strongly indexical than are those languages (e.g., English) that lack an elaborate honorifics system. That is, different honorific forms are used according to different types of addressee, and thus honorific forms indicate the types of interactants. Hill *et al.* (1986) showed that American students use the same expression, *May I borrow your pen?*, to fairly diversified categories of people, including professors, strangers, physicians, and store clerks. On the other hand, Japanese students would use the super-polite form *Pen o*

okarisitemo yorosii desyoo ka '(lit.) Is it all right if I humbly borrowed your pen?' specifically to address their professors, but the middle-level polite form *Pen o kasite itadake masu ka* '(lit.) Is it possible that you give me the favor of lending me your pen?' to address classmates or other people, including strangers, physicians, store clerks, etc. Clearly the Japanese students' speech form sets their professors apart from other categories of people they interact with, reflecting the distinct status that the Japanese students, unlike their American peers, accord to their professors. In other words, the most elaborate honorific expression indexes the occasion in which the most relevant power superior is involved.

This kind of indexing function of honorifics is much more clearly seen in those languages in which speech levels are more rigidly determined in relation to speech situations. A given speech level, called a 'register' precisely for the reason being discussed here, in such a language indicates clearly what sort of interaction is involved. For example, Javanese has as many as 10 speech levels, and each register indicates the nature of interactants (Sakiyama, 1989). For example, the low, ordinary style *(Ngoko lugu)* is used when elders address younger ones, or between intimate friends. The middle style *(Madyå ngoko)* is used among female itinerant merchants, among country folk, and when the nobility address their subordinates. The highest form *(Kråmå inggil),* on the other hand, is used when a superior is to be treated with special deference (see also Geertz, 1968).

Honorifics, in sum, convey social meaning, as opposed to the referential meaning a sentence is normally understood to express. They indicate, among other things, the social categories of the people with whom the speaker is interacting. This in turn has the effect of making the speakers of an honorifics language more attentive to those factors (e.g., age, wealth, occupation, family background) that determine the categories of people. The speaker must ascertain quickly what kind of people he is dealing with so as to choose honorific forms appropriate to his interactants. Thus the presence or absence of an elaborate honorifics system may have a rather profound effect on how people perceive their environments and how they structure their communicative strategies.
